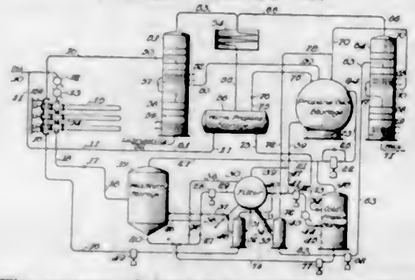
8. Apparatus for conditioning mine air comprising a source of compressed air, means for cooling such air only to approximately atmospheric temperature, means at the surface of a mine to devaporize the cooled compressed air, an expansion motor arranged to be driven by the devaporized compressed air, a secondary compressor situated in the mine and driven by said expansion motor, means to supply cooling water to the secondary compressor, means to convey the resulting cooled water to the mine draining system, and means whereby the exhaust air from the motor is used to cool the mine atmosphere.

2,097,724
COLLAPSIBLE IRONING TABLE
Cal A Forney, Goshen, Ind.
Application December 31, 1934, Serial No. 759,989
5 Claims. (Cl. 38—117)

1. In an ironing table construction, an ironing board proper, and means for operatively supporting the board including a pair of legs, means loosely pivoting the legs to the ironing board in such manner that they are movable towards or away from each other transversely of the ironing board, pivoted cross bracing means for connecting said legs together, including a pair of cross braces having pivoted together portions, one portion of each brace being connected to one leg in a pivoted relation and the other portion of each brace being pivotally connected to the other leg, and means whereby said legs will move toward one another when said legs are folded against the ironing board proper, including a substantially V-shaped flexible member, pivoted at its apex to said board back of the first named means and pivoted at the free ends of its arms to like portions of each of said braces.

2,097,725
ART OF SEPARATING OIL IN REFRIGERATION SYSTEMS
Norman H. Gay, Los Angeles, Calif.
Application April 4, 1936, Serial No. 72,828
17 Claims. (Cl. 62—115)

1. A separating apparatus for refrigerating plants, comprising inner and outer jackets and walls sealing the space between the jackets and providing chambers at the upper and lower ends of said jackets, a plurality of small tubes communicating with said chambers and being located in the space between the jackets, an inlet connection for hot refrigerant liquid at the upper end of the jacket space, an outlet connection for refrigerant liquid at the lower end of the jacket space, a connection for delivering a mixture of oil and liquid refrigerant into the lower chamber, a suction connection from the upper chamber, and an oil withdrawal connection at the lower end of the space inside the inner jacket, the upper end of the space within said inner jacket being in communication with the upper chamber at a low level thereof.



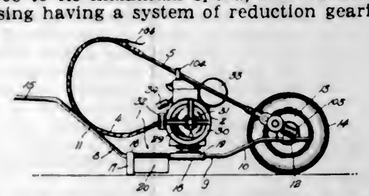
2,097,726
PROCESS FOR THE MANUFACTURE OF SULPHONIC ACIDS FROM ARYL ETHYLENES AND THE PRODUCTS THEREOF
Hans Grotowsky, Krefeld-Uerdingen, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application August 29, 1934, Serial No. 742,013. In Germany September 22, 1933
18 Claims. (Cl. 260—159)

12. An ethereal solution of an additive compound of chlorosulphonic acid to indene, said product possessing the formula $C_9H_8ClSO_3H$.

2,097,727
TIN ALLOYS
Daniel Hanson, Haselor, Alcester, and William Thomas Pell-Walpole, Tipton, England, assignors to John Campbell, Kensington, England
No Drawing. Application November 28, 1936, Serial No. 113,256. In Great Britain December 23, 1935
4 Claims. (Cl. 148—32)

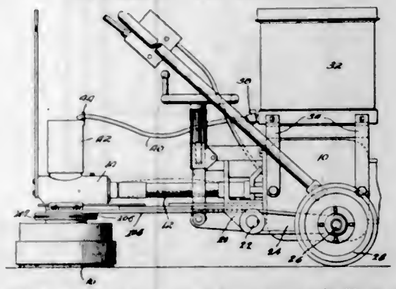
1. Tin alloys containing from 2 to 14 per cent. of antimony and about 1 to 10 per cent. of cadmium, the balance being tin.

2,097,728
PROPANE DEWAXING
Percy C. Keith, Jr., Peapack, N. J., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application April 30, 1934, Serial No. 723,043
1 Claim. (Cl. 196—19)



The process of dewaxing employing a diluent and a condensible gas in a continuous filter system, which process comprises dissolving a wax-bearing oil in the diluent, cooling the solution to obtain a filterable wax slurry, adding cold liquefied gas to said slurry, introducing the slurry and liquefied gas into the continuous filter, introducing condensible gas as such into said filter for maintaining the pressure differential therein, removing gas with filtrate and subsequently separating gas therefrom, compressing and cooling the separated gas, flashing the cooled separated gas to partially liquefy it and cool it for addition to said slurry, introducing the flashed gas into a large storage reservoir, introducing gas from said reservoir to said gas-compressing and cooling means, and to said filter for maintaining pressure differential, removing diluent and additional condensible gas from said filtrate, returning said gas to said storage reservoir and returning said recovered diluent for admixture with further amounts of incoming waxy oil.

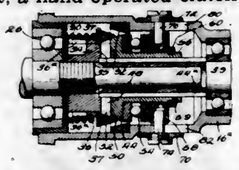
2,097,729
PORTABLE POWER MACHINE
Arthur W. Mall, Chicago, Ill.
Application January 9, 1935, Serial No. 1,077
7 Claims. (Cl. 123—179)



1. A power machine comprising a carriage having a power source mounted thereon, means

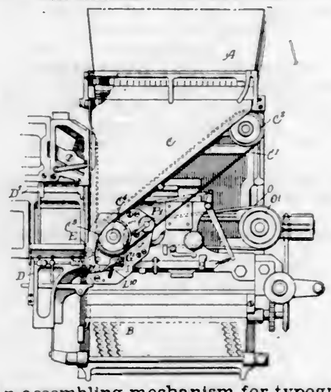
for connecting said power source to a flexible drive shaft so that the flexible drive shaft may have its rotational speed slowly and evenly increased from zero at idling speed of the power source to a maximum on the raising of the power source to its maximum speed, a reduction gear housing having a system of reduction gearing, a

stub shaft having a clutch element at its free end, said shaft supported by the housing and driven by said gearing system, said gearing system being operatively connected to said flexible shaft so that it may be driven thereby, a rigid handle on said housing, and means on said handle connected to said power source for slowly and evenly varying the speed developed by the power source.



2,097,730
TERRAZZO GRINDING APPARATUS
Arthur William Mall, Chicago, Ill.
Application April 12, 1935, Serial No. 15,966
10 Claims. (Cl. 51—177)

2. The combination in a terrazzo grinding machine of a horizontally disposed motor, a fluid supply associated therewith, a wheeled support secured to said motor, a flexible shaft extending from said motor, a spindle driven thereby, a housing therefor, a universally tiltable face grinding wheel at the lower end of said spindle, a spring member extending from said motor and supporting said spindle housing, a sand hopper mounted above said grinding wheel on said spindle housing, a conduit from said fluid supply to said sand hopper, and a conduit extending from the lower end of said hopper to the center of said grinding wheel.

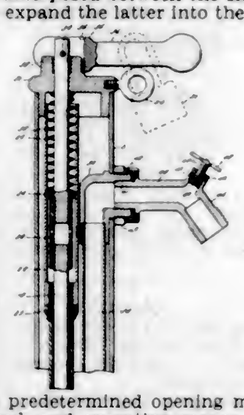


2,097,731
CLUTCH MECHANISM
Arthur William Mall and Thomas A. Long, Chicago, Ill., assignors to Mall Tool Company, a corporation of Illinois
Application May 9, 1935, Serial No. 20,648
Renewed April 20, 1937
3 Claims. (Cl. 192—18)

1. In combination with a flexible drive shaft, a housing therefor, a driving clutch member having a forward face, said face having a toothed surface and a tapered friction surface, a driven clutch member having a forward face, said face having a toothed vertical surface and a cone-shaped friction surface whereby engagement of said clutch members operates to provide first a friction engagement and then a locked driving engagement, a hand operated clutch lever pivot-

ally mounted on said housing, a shifting ring movable thereby and a brake member in said housing for stopping movement of said driven clutch member when the same is released.

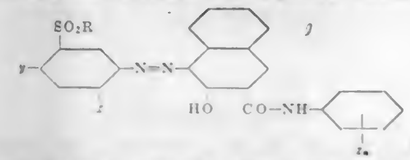
2,097,732
TYPOGRAPHICAL COMPOSING MACHINE
Richard R. Mead, Queens Village, N. Y., assignor to Mergenthaler Linotype Company, a corporation of New York
Application January 15, 1936, Serial No. 59,207
22 Claims. (Cl. 199—27)



1. An assembling mechanism for typographical composing machines including, in combination, an assembler wherein the matrices are composed in line, stacker mechanism operable at different speeds for advancing the matrices and compacting them in the assembler as the line is being composed, and means adapted upon actuation to effect an instantaneous change from one speed to another as required.

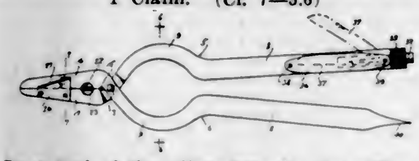
2,097,733
HYDRANT
Louis R. Miller, Arcadia, Mo.
Application February 16, 1937, Serial No. 126,096
2 Claims. (Cl. 137—13)

1. A hydrant comprising a foundation attachable base plate, a vertically extending case detachably secured to the base and provided with a cap, a vertically extending valve rod, a block structure mounted within the lower portion of the case and having a horizontal water inlet bore therein, said block being provided with a pair of vertical bores one of which communicates with the horizontal bore and the other bore communicating with the last mentioned vertical bore, a valve member seatable in the first named vertical bore and to which the valve rod is connected, a water outlet for the other vertical bore, a sleeve surrounding the rod having its lower end positioned in said first named vertical bore, drain openings in said first-named vertical bore,



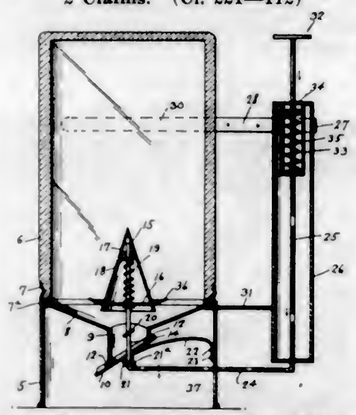
an expansible packing carried by the rod, means on the rod interposed between the sleeve and the packing to expand the latter into the drain open-

ing upon a predetermined opening movement of the valve rod, and operating means at the said cap for the rod.



2,097,734
PIGMENT AZO DYESTUFFS
August Modersohn, Cologne-Mulheim, and Werner Schleifenbaum, Leverkusen-I. G.-Werk, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application March 11, 1935, Serial No. 10,580. In Germany March 17, 1934
4 Claims. (Cl. 260—95)

1. Pigment dyestuffs of the general formula:

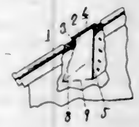


wherein R stands for a member selected from the group consisting of alkyl, aralkyl and aryl, x and y stand for members selected from the group consisting of hydrogen, alkyl, alkoxy, halogen, aralkyl, aryl, aralkoxy and aryloxy in such a manner that y only stands for the same value as x, if x stands for hydrogen or alkyl, z stands for a lower alkyl group and n stands for a whole number larger than 1, and such derivatives thereof in which two z's in o-position to each other form a tetramethylene chain, being distinguished by a good fastness to light combined with a good fastness to oil, spirit and solvents.

2,097,735
SEWING MACHINE TOOL
Eugene J. S. Mrozinski, Milwaukee, Wis.
Application November 28, 1936, Serial No. 113,194
1 Claim. (Cl. 7—5.6)

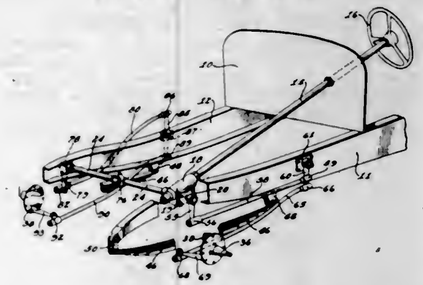
In a tool of the pliers type for use with machine belts, a pair of handles provided with cooperating clamping jaws and pivoted together for limited opening movement of said jaws, one jaw having mounted thereon a punch element extending from the inner face thereof and spaced at its outer end from the other jaw in the open position of said jaws to permit the insertion of a belt between said punch and said other jaw, the other jaw having a punch clearance aperture therein, and a shearing blade on one side of the punch mounting jaw opposite said punch, whereby the punching and shearing operations are concluded simultaneously, said punch extending slightly beyond the opposite edge portion of said blade for slight penetration of a belt prior to shearing thereof, whereby the belt is securely held in position relative to said blade preparatory to shearing.

2,097,736
CONTAINER
George T. Phelps, Forbes, N. Dak.
Application October 21, 1936, Serial No. 106,864
2 Claims. (Cl. 221—112)



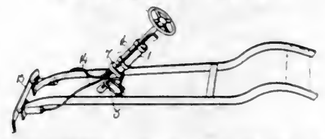
1. In a device of the character described, a substantially cylindrical support having a peripheral wall threaded at the upper end thereof, an inverted container having a threaded neck threadedly engaged with said wall of the support, said support being provided internally with a partition having a depending discharge neck, a tubular member disposed laterally of said support and receptacle and in parallelism thereto, a rod having a sliding fit through said tubular member, spring means engaged with the rod normally urging the latter upwardly, said rod having an integral lateral arm extending therefrom through a slot in the wall of said support, a valve rod integral with said arm and extending upwardly through said discharge neck, a valve member on the upper end of the valve rod adapted to seat against the partition for closing the inner end of said neck, and a second valve member for closing the lower end of said neck provided at the center thereof with an apertured boss through which said valve rod extends.

2,097,737
DETERGENT COMPOSITION
Oscar A. Pickett and Arthur L. Osterhof, Wilmington, Del., assignors to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application August 10, 1935, Serial No. 35,628
11 Claims. (Cl. 87—5)



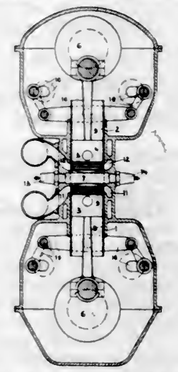
1. A clear, liquid detergent composition comprising 50%–80% of a mixture of an alkali metal soap and a detergent selected from the group consisting of aliphatic amine soaps, sulfonated oils and mixtures thereof; 10%–45% pine oil and 5%–30% water; the said mixture of alkali metal soap and selected detergent consisting of 50%–95% of the alkali metal soap and 5%–50% of the said selected detergent, and the water and pine oil being relatively proportioned so as to form a clear solution when all the ingredients are mixed.

2,097,738
SKYLIGHT
Kenzo Oita, Sumiyoshimura, Mukogun, Hyogo-ken, Japan, assignor to The Toyo Cotton Mills Company Limited, Osaka, Japan, a firm of Japan
Application May 31, 1935, Serial No. 24,422
In Japan June 5, 1934
5 Claims. (Cl. 108—16)



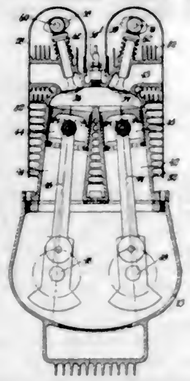
1. A skylight for a roof in which an oblong inlet for the light is provided which is relatively narrow in the south and north direction and relatively long in the east and west direction, comprising a board associated with said inlet for intercepting the light, end plates associated with said board, a second board disposed opposite to said first board so as to form with said end plates and said first board, a hollow pyramid construction, said hollow pyramid construction extending inwardly from the four sides of said inlet.

2,097,739
MOTOR VEHICLE
Peter F. Rossmann, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan
Application February 13, 1934, Serial No. 711,056
7 Claims. (Cl. 280—95)



1. In a motor vehicle, the combination with a vehicle frame, of a pair of steerable road wheels disposed adjacent said frame at opposite sides thereof, a motor for operating said vehicle carried by said frame, means connecting said road wheels for conjoint steering movement, said means including a shaft supported for rotation by said frame and extending across the latter forward of the motor, said shaft being disposed substantially in the vertical transverse plane containing the road wheel axes, and worm gearing for operating said shaft.

2,097,740
EMERGENCY STOPPING DEVICE FOR MOTOR CARS
Boku Saigen, Keijo, Japan, assignor to Toho Kagakukogyo Kabushiki-Kaisha, Keijo, Japan, a corporation of Japan
Application June 2, 1936, Serial No. 83,134
In Japan October 10, 1935
2 Claims. (Cl. 180—83)



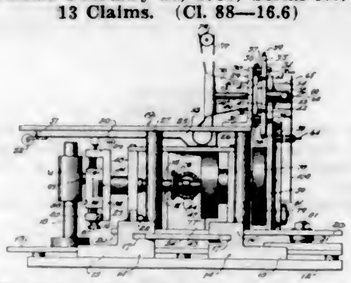
1. An emergency stopping device for motor cars, comprising a bumper, brake and clutch operating levers, a spring-actuated plunger slidable in a casing and having a cross pin for directly operating said levers, a pinion and a ratchet wheel mounted on a shaft, said pinion engaging a rack on the plunger for moving the plunger to energize its actuating spring, said spring also being arranged in the casing, a pawl engaging the ratchet wheel to hold the spring in energized condition and means operable by pressure transmitted from the bumper or applied by the operator for disengaging said pawl from the ratchet wheel to release the spring.

2,097,741
VALVE MECHANISM IN INTERNAL COMBUSTION ENGINES OF THE OPPOSED PISTON TYPE
Ernst Schmid, Annecy, Haute-Savoie, France
Application January 22, 1936, Serial No. 60,287
In Germany February 5, 1935
4 Claims. (Cl. 123—51)

3. In an internal combustion engine, the combination comprising two opposed pistons, a common cylinder having the same inner cross section throughout for said opposed pistons and having inlet and exhaust ports in an intermediate zone of said cylinder of uniform cross section, a sleeve valve for each piston free from ports and of relatively thin material interposed between the piston and the interior wall of said cylinder and sliding on said interior wall up to and beyond the respective ports of the cylinder, one of said sleeve valves controlling the inlet port and the other controlling the exhaust port, said sleeve valves controlling said ports by their inner edges which slide across said ports and beyond the same in cooperation with said constant cross sectional inner wall of said cylinder.

2,097,742
ACCESSORY DRIVE MECHANISM
Bateman David Scott, Camp, Miserden, near Stroud, England
Application January 8, 1935, Serial No. 910
In Great Britain January 8, 1934
3 Claims. (Cl. 123—195)

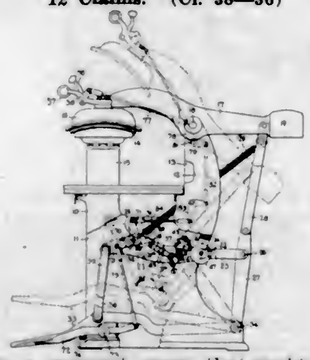
1. In an engine of the multi-cylinder type more particularly for aerial propulsion, a driving mechanism comprising parallel crankshafts, a plurality of shafts including cam-shafts connected to the elements of said engine such as valve gear, pumps and other accessories, cranks disposed upon all of these shafts, main and auxiliary frames connecting said cranks in driving relation thereto, means for operating said frames in concordance with the rotation of the crankshafts including a reduction gearing for actuating the main frame at substantially quarter engine speed, and gearing for actuating the auxiliary frames at substantially engine speed.



2,097,743
METHOD FOR THE RECOVERY OF TERPENES FROM MIXTURES CONTAINING THE SAME
Donald H. Sheffield, Brunswick, Ga., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application November 15, 1934, Serial No. 753,130
14 Claims. (Cl. 260—167)

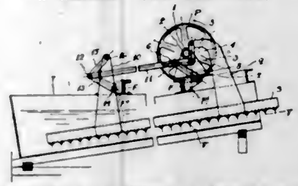
1. The method for the recovery of terpenes from a non-fractionable mixture containing a pinene which includes treating the mixture to isomerize the pinene to a terpene having a boiling point different from that of pinene, subjecting the treated mixture to fractional distillation and recovering the said terpene.

2,097,744
METHOD FOR THE ISOMERIZATION OF PINENE
Donald H. Sheffield, Brunswick, Ga., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application November 15, 1934, Serial No. 753,131
7 Claims. (Cl. 260—167)



1. The method of producing dipentene and terpinene by isomerization of a pinene which includes heating a pinene with phosphoric acid at a temperature of from about 70° C. to about 100° C.

2,097,745
APPARATUS FOR MAKING MOVING PICTURES IN DEPTH
Harry Smith, Los Angeles, Calif., assignor of one-third to John H. McCoy, and four per cent to Carmine Morrell, both of Los Angeles, Calif.
Application February 25, 1936, Serial No. 65,729
13 Claims. (Cl. 88—16.6)

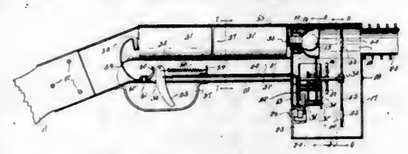


1. In an apparatus for the purpose set forth, a base structure, a holder structure arranged over said base structure including a lens carrier guide at its front, a lens carrier mounted in said guide, means for pivotally connecting said holder structure to said base structure, said structures having coacting inter-engaging means for slidably connecting the holder structure to the base structure intermediate the ends of the latter, a driving mechanism, an operating shaft journaled in said holder structure lengthwise of the latter and driven from said mechanism, said shaft and carrier having coacting inter-engaging parts for reciprocating the carrier on the operation of said shaft, a vertically and horizontally movable element mounted over the base structure and formed with a stud, an adjustable gage structure permanently encompassing and revoluble about said stud, bodily carried by said shaft and including an adjustable part providing when adjusted for bodily carrying said element therewith, to angularly position the holder structure relative to the base structure and to provide for the oscillating of the holder structure simultaneously with the reciprocation of the carrier.

2,097,746
GARMENT PRESSING MACHINE
William Strobridge, Syracuse, N. Y., assignor to United States Hoffman Machinery Corporation, New York, N. Y., a corporation of Delaware
Application March 19, 1936, Serial No. 69,698
12 Claims. (Cl. 38—36)

11. In a garment press, the combination of cooperating relatively movable pressing members; toggles for effectuating said movement; locking means for at least one of said toggles attached to and carried thereby to hold the toggles in pressure applying position; a lock holding said locking means in its locking position; and means under the control of the operator for releasing the lock.

2,097,747
RECIPROCATING SCRAPING MACHINE
Kyo Suzuki, Hitachi-machi, Tagagun, Ibaraki-ken, Japan, assignor to Nihon Kogyo Kabushiki Kaisha, Tokyo, Japan
Application August 19, 1936, Serial No. 96,890
In Japan September 13, 1935
1 Claim. (Cl. 198—224)

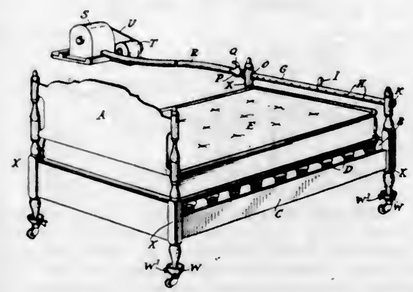


In a scraping machine, a frame, a series of claws carried by said frame, a pin for supporting said frame at each end thereof, means for bodily moving and supporting one of said pins comprising a bell crank having one end thereof connected to one of said pins, rotatable means supporting the central portion of said crank, a swingable link connected to the other end of said crank, means for supporting the other of said pins comprising a fixed support, a link pivoted thereto of a length equal to said first mentioned link, a third link pivoted to the swingable end of said second mentioned link, and having the opposite end pivoted to the other of said pins, the length of said third mentioned link being equal to the distance between the ends of said bell crank, and means connecting said supports positioned at opposite ends of the frame, said last mentioned means being equal in length to the distance between the pivotal points of said swingable links, and means for rotating the central portion of said bell crank whereby both of said frame supporting pins are moved in similar paths to bodily move said frame in one direction in a straight plane and in a raised curved path during the reversal thereof.

2,097,748
AIR-COOLED SAFETY TIRE
Earl Von Bon Horst, San Clemente, Calif.
Application December 28, 1936, Serial No. 117,983
8 Claims. (Cl. 152—10)

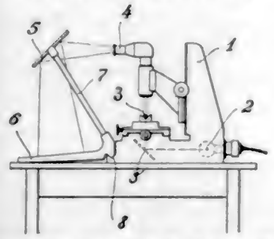
1. In a tire, the combination with a primary rim, of an auxiliary metal rim provided with metal legs on said primary rim, said metal legs provided with integral spacing means pressed in from their inner faces, and an inner tube and a shoe on said auxiliary and primary rims.

2,097,749
TOY MACHINE GUN
James T. Wade, Ogden, Utah, assignor of one-third to Samuel E. Ward, Green River, Wyo.
Application November 21, 1935, Serial No. 50,957
9 Claims. (Cl. 46—1)



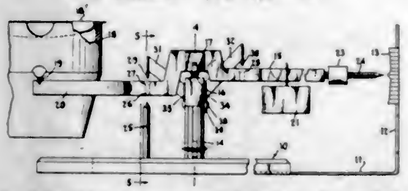
1. A device of the class described, having a barrel, a lamp in line therewith, a motor, a diaphanous member operable by the motor in line with the lamp and barrel, and a common means operable to energize the lamp and permit operation of the motor.

2,097,750
SYNTHESIS OF ALKYL HALIDES
Herrick R. Arnold, Elmhurst, and Edward T. Lessig, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application February 21, 1931, Serial No. 517,630
13 Claims. (Cl. 260—166)



1. In the process of preparing an alkyl halide, the step which comprises bringing a gaseous mixture of an olefine hydrocarbon and a hydrogen halide into contact with a catalyst comprising essentially a halide of a metal of Group II, Sub-group B, of the Periodic Table.

2,097,751
BODY-RESTING DEVICE
Michael Baltich, Cold Spring, N. Y.
Application May 18, 1936, Serial No. 80,298
2 Claims. (Cl. 5—284)

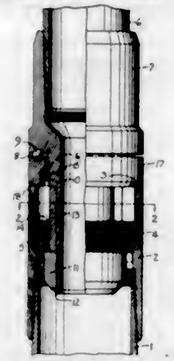


1. A body-resting device comprising a bedstead having two bed posts, an air pump, a conduit leading from said air pump to the first of said bed posts, a manually operable valve in said conduit disposed adjacent said first bed post, a tube rotatably journalled in said two bed posts, said tube having a plurality of apertures disposed in a straight line, one end of said tube being connected to said valve, the opposite end of said tube being closed by a plug carried in the second bed post, and means for rotating said tube, whereby air forced in jets through said apertures by the pressure generated by the pump may be directed at any desired angle to the vertical.

2,097,752
WORKSHOP MICROSCOPE
Helmut Becker, Wetzlar, Germany, assignor to Ernst Leitz G. m. b. H., Wetzlar, Germany
Application March 18, 1935, Serial No. 11,569
In Germany March 19, 1934
1 Claim. (Cl. 88—24)

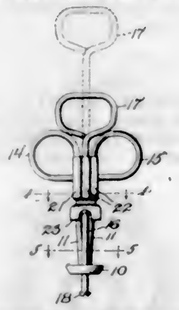
In a workshop microscope, a microscope member, a foot part for said member having a laterally extending groove in its inner end and adapted to be supported on a table, and including a lamp and an object holder, a reflector below said object holder to reflect the light of said lamp onto a projection objective combined with said microscope, an angularly disposed mirror upon which the image of the object on its holder is projected by said objective, a plate means adapted to be positioned on said table onto which the image of the object is reflected from said angularly disposed mirror to be traced on said plate, and an inclined rod supporting said angularly disposed mirror at its upper end and secured at its lower end in the frame of said plate, said plate having a projection on its lower, outer end below said objective to engage in the groove in the foot part of the microscope to permit a ready manual adjustment of the angularly disposed mirror relatively to the microscope.

2,097,753
BALANCE
Harry Bennett, New York, N. Y.
Application January 23, 1936, Serial No. 60,401
6 Claims. (Cl. 265—49)



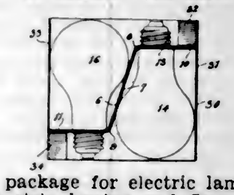
1. A balance comprising a base, an oscillatable beam mounted upon a suitable standard extending upwardly from the base, said beam being provided with recesses in the upper surface of its opposite arms, and means movably carried by the standard for engaging said recesses in the beam to hold the latter firmly to the said standard.

2,097,754
STENCIL SHEET
George Burt Bradshaw, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 27, 1935, Serial No. 56,320
5 Claims. (Cl. 41—38.6)



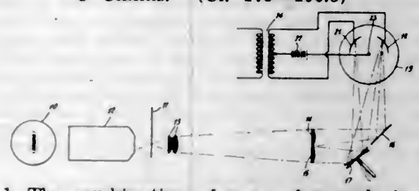
5. A stencil sheet comprising a flexible, ink permeable base sheet having a coating solution applied thereto, comprising a plasticizer, a tempering agent, and methyl methacrylate, said coated sheet being capable of being cut by type.

2,097,755
LINER SETTING TOOL
Cicero C. Brown, Houston, Tex.
Application August 27, 1936, Serial No. 98,191
2 Claims. (Cl. 166—1)



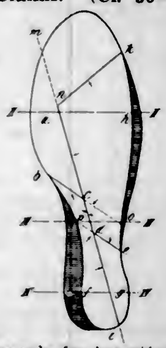
1. A device for setting pipe in wells including a sleeve at the upper end of said pipe, a seat on said sleeve, a locking collar having a lefthand threaded engagement on the interior of said sleeve, a setting nipple, a mandrel thereon in said sleeve, a ring on said mandrel engaging in said seat, a shoulder on said mandrel below said collar, and means on said mandrel to slidably engage said locking collar and by rotation screw it up away from engagement with said sleeve while said ring is engaging said seat and supporting said nipple thereon.

2,097,756
FRUIT PITTER
John Clark Brown, New York, N. Y.
Application November 13, 1935, Serial No. 49,488
2 Claims. (Cl. 146—21)



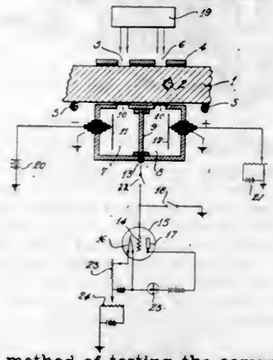
2. A fruit pitter comprising a wire bent to form an annular seat and then bowed rearwardly and upwardly and then extended in spaced parallel relation and bent over at the top to form outwardly extending finger loops, a second wire slidable between the parallel parts of the first wire and having a finger loop at the top and an annular projecting cutting edge at the bottom, and a clip enclosing the parallel parts of the first wire and the second wire and having a forked bottom end through which the second wire passes for stripping fruit therefrom.

2,097,757
PACKAGE FOR ELECTRIC LAMPS OR SIMILAR ARTICLES
Fred. H. Deike, Long Beach, N. Y., assignor of one-fifth to Harry Radzinsky, New York, N. Y.
Application November 24, 1936, Serial No. 112,493
10 Claims. (Cl. 229—6)



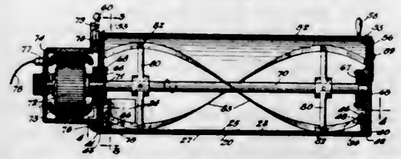
1. In a package for electric lamps or similar articles, a strip having end flaps extending in opposite directions from the center portion of the strip, said end flaps being apertured to receive and hold the bases of the lamps whereby a lamp received and held by one of the flaps extends in a direction opposite to that held by the other flap, said center portion of the strip extending between and connecting the flaps and forming a partition between the lamps and an enclosure for the strip and lamps held by it.

2,097,758
REPRODUCTION OF SOUND
Glenn L. Dimmick, Haddonfield, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application January 19, 1935, Serial No. 2,460
5 Claims. (Cl. 179—100.3)



1. The combination of means for producing a plurality of acoustically modulated light beams, a light sensitive device provided with a plurality of cathodes, means for directing selected portions of said beam, separate cathodes and means for selectively directing said portions to a single cathode.

2,097,759
CORRECTIVE SOLE
Edward Ehrlich, Amsterdam, Netherlands
Application November 24, 1934, Serial No. 754,563
In Great Britain November 30, 1933
2 Claims. (Cl. 36—71)



1. A corrective sole for insertion in shoes characterized by opposed inclined lever-acting planes on its foot-supporting surface located in front of and in the rear of the shank portion of the sole, said planes being formed by elevated portions tapering in thickness from the opposite edges of said sole and meeting only in the shank thereof in a line which is inclined with respect to the longitudinal axis of the sole.

2,097,760
TESTING METHOD AND APPARATUS
Gioacchino Failla, New York, N. Y.
Application November 29, 1930, Serial No. 498,959
11 Claims. (Cl. 250—34)

1. The method of testing the composition of a material which comprises producing a beam of X-rays, passing said beam through the material to be tested and through a piece of standard material, controlling ionization currents by controlling the X-rays passed through said materials, balancing the voltage drops due to said ionization currents, varying the quality of the X-rays at the source to determine whether voltage drops become unbalanced, and noting the quality of said X-rays for which unbalance occurs.

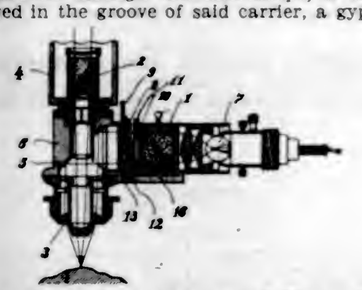
2,097,761
HEDGE TRIMMER
Raphael C. Gallinant, Ridgefield Park, N. J., assignor of one-half to John C. Chello, Ridgefield Park, N. J.
Application May 6, 1936, Serial No. 78,100
12 Claims. (Cl. 30—240)

1. In a hedge trimmer having rotary helical knives and a stationary cutter bar cooperative therewith, a plate below and in advance of said cutter bar, said plate having projections on its front edge presenting a multiplicity of angular serrations opposed to the angle of the helix of said helical blades on one side and at right angles with said cutter bar on the other side.

2,097,762
MICROSCOPE
Hermann Heine, Wetzlar, Germany, assignor to Ernst Leitz, Optische Werke, Wetzlar, Germany
Application May 23, 1934, Serial No. 727,052
In Germany May 26, 1933
1 Claim. (Cl. 88—40)

In a microscope system of the class described

including an annular mirror, an illuminator carrier having an inner groove and a recess, a polarizer between said illuminator carrier and said annular mirror, said annular mirror directing the light rays of the illuminator in said carrier reflected therein from above onto the object to be observed through the microscope, a holder engaged in the groove of said carrier, a gypsum



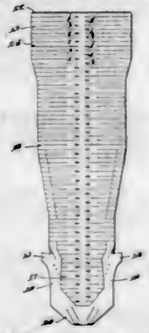


plate exchangeably held in said holder in front of said polarizer, a filter disc in said carrier between said polarizer and said gypsum plate, and a sector diaphragm in the recess of said carrier in front of said polarizer spaced from said filter disc, and a spring in the space between said diaphragm and filter disc engaging both to hold the same in place for ready detachment or insertion and convenient adjustment.

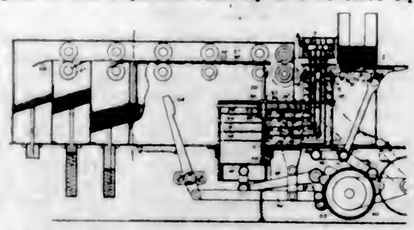
2,097,763

KNITTED STOCKING

Hugo Hemmerich, Wyomissing, Pa., assignor to Berkshire Knitting Mills, Wyomissing, Pa., a corporation of Pennsylvania

Application May 29, 1934, Serial No. 728,084
1 Claim. (Cl. 66—178)

A knitted stocking having at least a portion thereof substantially composed of a multiplicity of series of adjacent yarn zones repeated throughout said portion of the stocking, each of said zones comprising one or more courses of body yarns, the individual zones respectively being knit from yarns of different character including a braided yarn, said zones being selectively commingled to give to the fabric a characteristic which is the resultant of the individual characteristics of said zones.



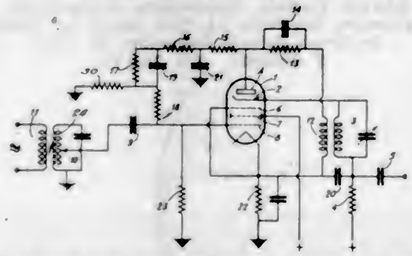
2,097,764

MACHINE FOR SORTING PUNCHED CARDS MECHANICALLY AND ELECTRICALLY

Marcel Jacob, Paris, France, assignor to William A. Preston, Binghamton, N. Y.

Application December 9, 1933, Serial No. 701,610
In France December 10, 1932
5 Claims. (Cl. 209—110)

1. A machine for sorting punched cards, which comprises in combination, a plurality of bins for said cards, means for conveying said cards one by one toward said bins, a plurality of movable blades lying across the path of travel of said cards, said blades being so connected with said bins respectively that the lifting of one blade causes the next card moving toward said blade to fall into the corresponding bin, said blades being piled upon one another and the pile thus formed being provided with a plurality of parallel elongated holes the bottoms of which are stepped in the longitudinal direction of said holes each step corresponding to one blade, the maximum depth of one hole being smaller than the minimum depth of the adjacent hole by a difference equal



to the thickness of a blade, a support movable in a horizontal direction parallelly to said holes, a plurality of elements vertically slidable in said support disposed in a line transverse to each of said holes, means for controlling the position of said support with respect to said blades, a vertically slidable element movable in a horizontal direction at right angles to the direction of displacement of said support, means for controlling the position of said element in the last mentioned direction, reading means operative by the perforations in said cards for controlling both the last mentioned means and the displacements of said support, and means operatively interconnected with the means for conveying the cards for moving said element in the vertical direction.

2,097,765

REGENERATIVE RADIO RECEIVER

Ernst Klotz, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application July 31, 1935, Serial No. 33,999
In Germany July 25, 1934
6 Claims. (Cl. 250—20)

1. A combined amplifying and detecting device for modulated high frequency signal currents comprising the combination of a vacuum tube having a cathode, an anode and a signal control grid and a second grid located in the electron stream between said anode and cathode, means for impressing the signal currents on said control grid, an output circuit connected to said second grid and including the series connection

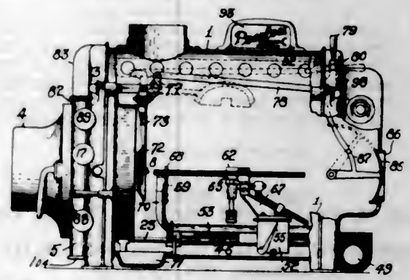
of a high resistance and a coil, a condenser having a low impedance to currents of the modulation frequency connected to one end of said resistance, a connection between said anode and cathode including the series connection of a resistor and a second coil, said coils being inductively coupled together, and a direct current connection between said anode and cathode and including at least two resistors connected in series, said resistors being arranged to also transfer the modulation potentials of said anode to said signal control grid.

2,097,766

MEANS FOR PRODUCING MUSHROOMS

Herman Knaust and Henry Knaust, West Camp, N. Y.

No Drawing. Original application August 2, 1934, Serial No. 738,118. Divided and this application March 12, 1936, Serial No. 68,450
4 Claims. (Cl. 47—37)



1. For use in the production of mushrooms, in combination, an open top transportable container having marginal walls of sufficient height to safely retain a mushroom growing bed therein during transportation and shipment of the container and of sufficient strength to permit stacking of large numbers of said containers in staggered and over-lapping relation in a growing zone, a bed of development-supporting material within said container impregnated with mycelium in dormant condition, and a layer of sterilized earthen material upon said bed.

2,097,767

PROJECTOR LAMP

John E. McAuley and Guy R. Trevillian, Chicago, Ill., assignors to J. E. McAuley Mfg. Co., Chicago, Ill., a corporation of Delaware

Application September 21, 1935, Serial No. 41,551
19 Claims. (Cl. 176—51)

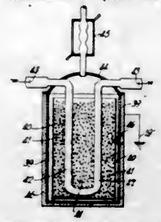
1. In a projector lamp, a pair of complementary shields normally lying in operative position to each side of the negative electrode to protect the mirror during striking of the arc, means for pivoting said shields at the top of the lamp, operating means for rotating said shields to lie at the top of the lamp, and means for simultaneously turning said shields to clear the lamp parts.

2,097,768

METHOD OF ROLLING ALLOYS

Frederick T. McCurdy, Kokomo, Ind., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York

No Drawing. Application March 19, 1935, Serial No. 11,814
2 Claims. (Cl. 80—60)



1. Method of forming stainless and wear resistant metal sheets and plates which comprises hot rolling at a temperature between 1900° F. and 2150° F. a billet of an alloy having substantially the composition: 15% to 35% chromium, 2% to 6% metal of the group tungsten and molybdenum, carbon in amounts up to about 1.25%, and the remainder principally cobalt; the billet being reheated to rolling temperature after each reduction in thickness of not over 0.015 inch until a total reduction of about 0.125 inch has been effected, and the billet thereafter being reheated to rolling temperature after each reduction in thickness of not over 0.03 inch.

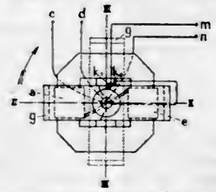
2,097,769

TREATMENT OF HYDROCARBONS

Waldemar O. Mitscherling, Bridgeport, Conn., assignor to The Neon Research Corporation, Bridgeport, Conn., a corporation of Connecticut

Original application April 28, 1931, Serial No. 533,406. Divided and this application June 1, 1935, Serial No. 24,477
12 Claims. (Cl. 204—31)

1. An apparatus for use in the conversion of a hydrocarbon comprising in combination a positive column rare gas tube surrounded by a jacket provided with inlet and outlet openings whereby said hydrocarbon may be passed through said jacket and about said tube to convert said hydrocarbon, said jacket being partially surrounded with a metallic material which is grounded.



12. An apparatus for converting a hydrocarbon into an oxygenated compound, comprising in combination a container for said hydrocarbon, a foraminous member in said container, a catalytic material upon said member, a rare gas vacuum tube having electrodes at the ends thereof and in which electric current is conducted by ions of the rare gas positioned at least partly within said container and at least partly surrounded with said catalytic material, means for passing said hydrocarbon to the rare gas tube and the catalytic material, and means for withdrawing the treated hydrocarbon from said container.

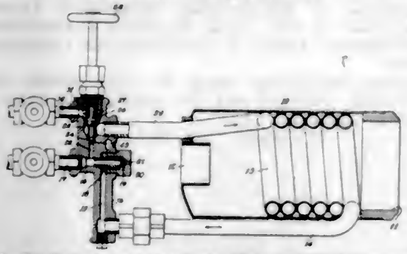
2,097,770

TRANSFORMER

Jan Morelisse, Amsterdam, Netherlands

Application January 21, 1937, Serial No. 121,614
In the Netherlands January 25, 1936
1 Claim. (Cl. 171—119)

A regulable single-phase transformer of the core type comprising in combination, a yoke, a



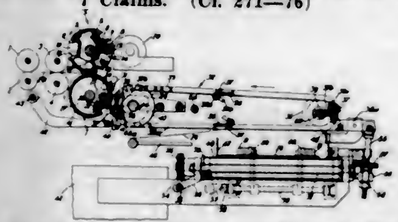
primary winding and a secondary winding on said yoke, and an auxiliary winding embracing said yoke and connected in series with one of said windings, said auxiliary winding being arranged to be rotated for adjustment about said yoke about an axis perpendicular to the surface of said yoke.

2,097,771

COMBINED ATOMIZING AND VAPORIZING TORCH

Seddon C. Nelson, New York, N. Y., assignor to Hauck Manufacturing Company, Brooklyn, N. Y., a corporation of New York

Application July 23, 1936, Serial No. 92,094
2 Claims. (Cl. 158—79)



1. In burner apparatus: the combination with a burner head provided with an inlet and a mouth, and a heating coil mounted in the head; of a nozzle element embodying an inner and an outer orifice axially displaced for directing fuel axially into said burner head inlet, a fuel connection to the nozzle element, a source of air supply, means for connecting the latter to one end of the heating coil, means connecting the other end of the said coil to the nozzle element for discharge through the outer of its orifices only, and a duplex valve member adapted to communicate with the said fuel connection and with the said source of air supply to afford alternatively air or fuel to the said heating coil and through the same to the nozzle element.

2,097,772

ENVELOPE OR BAG MAKING MACHINERY

Abraham Novick, Flushing, N. Y., assignor to F. L. Smithe Machine Co., Inc., New York, N. Y., a corporation of New York

Application December 12, 1933, Serial No. 701,948
7 Claims. (Cl. 271—76)

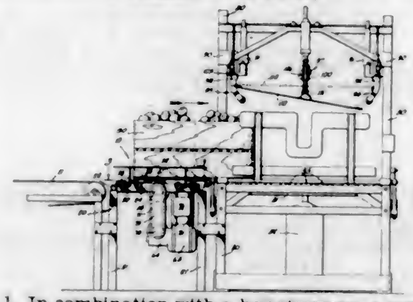
1. In a bag machine, in combination, a feeding cylinder, a gripper carried thereby, a conveyor running in juxtaposition with the periphery of the feeding cylinder, said conveyor including a crossbar cooperative with the face of the cylinder to grip and positively advance a blank, a gripper carried by the conveyor, and means for transferring the leading end of a bag blanks from the cylinder gripper to the conveyor gripper while the blank is gripped between the conveyor cross bar and the cylinder surface.

2,097,773

STABILIZED COLORED GASOLINE

John Wesley Orelup, East Orange, N. J., assignor, by mesne assignments, to Patent Fuels & Color Corporation, Cincinnati, Ohio, a corporation of Ohio

No Drawing. Application May 27, 1929
Serial No. 366,523
6 Claims. (Cl. 44—9)



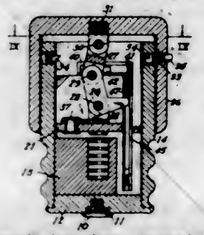
4. A mixture of a petroleum distillate and an organic coloring material not normally yielding a substantial degree of fluorescence in admixture with said distillate but having latent fluorescent properties, together with a stabilizing agent of the hydrophobe type imparting stability to the mixture of distillate and dye and developing the fluorescence of said dye.

2,097,774

BOX FEEDING DEVICE FOR STRAPPING MACHINES

Gerald C. Paxton, Santa Ana, Calif., assignor to Acme Steel Company, Chicago, Ill., a corporation of Illinois

Application February 10, 1937, Serial No. 125,097
5 Claims. (Cl. 1—10)



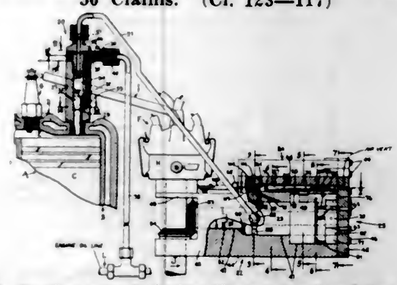
1. In combination with a box strapper: a power actuated feed conveyor adapted to receive boxes one at a time and discharge them one at a time into said strapper; and means on said strapper for starting said feed conveyor simultaneously with the placement of a strap in said strapper.

2,097,775

CIRCUIT BREAKER

Ralph R. Pittman and Carroll H. Walsh, Pine Bluff, Ark.

Application April 10, 1937, Serial No. 136,112
15 Claims. (Cl. 200—116)



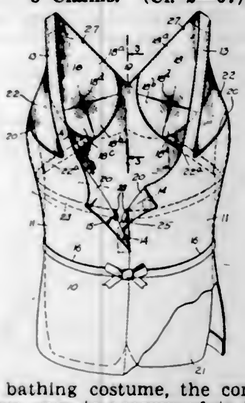
1. In a circuit breaker, movable contacts for opening and closing the circuit, resilient means biasing said contacts to the open circuit position, a thermally responsive element movable with said contacts, means electrically connecting said thermally responsive element in series circuit relation with said contacts, means including said element for normally latching said contacts in the closed position and for unlatching said contacts in response to a movement of said element, and means responsive to said movement for shunt-circuiting said element.

2,097,776

IGNITION CONTROL DEVICE

Carlyle L. Prentice, New York, N. Y.

Application July 25, 1935, Serial No. 33,008
50 Claims. (Cl. 123—117)



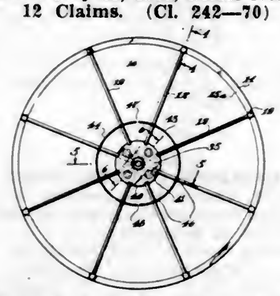
1. In the art of timing the successive firings of the combustion charge in the cylinder of an internal combustion engine employing the Otto cycle and wherein the load and speed may vary between successive firings of the charge, the method which consists in varying the timing of the ignition point so as to be automatically responsive to variations in load and speed and wherein at each firing stroke of the piston the charge will be ignited at that point in engine piston movement which will cause the peak pressure after the charge is fired to be approximately equal to double the pressure at the instant of time when the engine piston is at the top of its cycle of travel preceding its power stroke.

2,097,777

BATHING COSTUME

Emanuel M. Rothman, Philadelphia, Pa.

Application December 31, 1935, Serial No. 56,893
8 Claims. (Cl. 2—67)



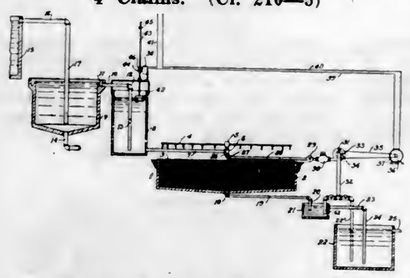
1. In a bathing costume, the combination of an overdress open to accommodate the neck and arms of the wearer, and a foundation lining connected to the overdress along the opening thereof, comprising breast covering pockets and elastic means passing from the pockets about the body of the wearer inside the foundation lining, the latter including guides formed in the foundation, each guide beginning at a pocket and being inclined downwardly to the side of the garment, said means comprising elastic bands traversing said guides and emerging therefrom at the sides of the garment, and separable fastening means for the free ends of the bands at the back of the garment.

2,097,778

FILM REEL CONSTRUCTION

Eugene Louis Schaub, Middle Village, Long Island, N. Y., assignor to Frank Ackerman and Herman Gould, New York, N. Y., a copartnership

Application July 28, 1934, Serial No. 737,371
12 Claims. (Cl. 242—70)



1. A film reel comprising in combination, side flanges comprising a ring-shaped rim and including wire spokes, the peripheral ends whereof are connected to and included within said ring-shaped rim, portions of said spokes adjacent the axial ends thereof being offset, a hub assembly for the axial ends including a cylindrical spacer, and side plates positioned in the plane of said offset portions of said spokes, including seats for said spokes.

2,097,779

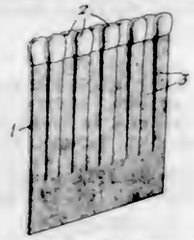
MEANS FOR PURIFYING POLLUTED LIQUIDS

Charles H. Shook, Dayton, Ohio

Application April 29, 1935, Serial No. 18,925
4 Claims. (Cl. 210—5)

1. In an apparatus of the type described, a dosage tank to receive polluted liquids, a trickling filter, means to receive the filtered liquid, a single conduit for delivering liquid from said dosage tank to the trickling filter and piping for returning the filtered liquid from the filtered liquid receiving means to said conduit for passage therethrough to said dosage tank for recirculation through the filter.

2,097,780



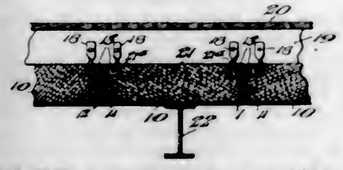
SLOW BURNING MATCH

Herman Silver, East Orange, N. J.

Application February 20, 1936, Serial No. 64,861
2 Claims. (Cl. 44—44)

1. A match comprising a stem of combustible fibrous material having porosity and texture of

the order of card-board and containing sodium nitrate uniformly distributed in its pores, and an igniting head, whereby said stem will relative-



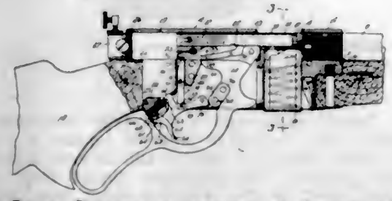
ly slowly but persistently burn and glow after extinguishment of the flame produced from ignition of said head.

2,097,781

BUILDING CONSTRUCTION

Frederick M. Venzie, Philadelphia, Pa., assignor to National Gypsum Company, Buffalo, N. Y., a corporation of Delaware

Application April 6, 1933, Serial No. 664,703
7 Claims. (Cl. 72—118)



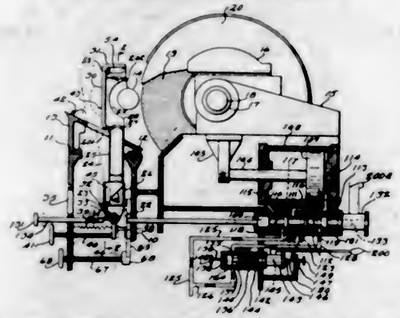
1. A building construction comprising a support, a unit comprising a pan having hook shaped portions and an interior fill of cementitious material, and means engaging said hook shaped portions and attachable to said support.

2,097,782

FIREARM

Marriner A. Browning, Ogden, Utah, assignor to J. M. & M. S. Browning Company, Ogden, Utah, a corporation of Utah

Original application May 27, 1935, Serial No. 23,561. Divided and this application June 2, 1936, Serial No. 83,048
4 Claims. (Cl. 42—70)



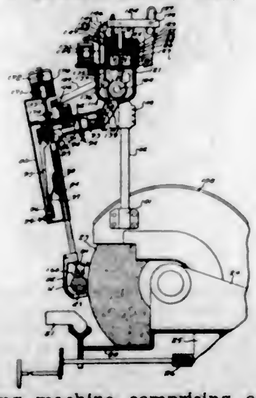
1. In a firearm, a receiver, a breech block slidably mounted therein, a striker slidably mounted in said breech block, a sear pivoted to said breech block and adapted to cooperate with said striker to hold the same in cocked position, a trigger, a safety directly cooperating with said trigger for preventing pulling thereof, and a connector engageable with said trigger and sear and adapted to release the sear from the striker when the trigger is pulled, said connector and sear having interengaging means for preventing the sear from being jarred out of striker holding position when said safety is in "on" position.

2,097,783

GRINDING MACHINE

Raymond A. Cole, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application October 9, 1935, Serial No. 44,204
4 Claims. (Cl. 51—165)



1. In an external cylindrical grinding machine, means for holding and rotating a work piece to be ground, a grinding wheel, means for procuring a cutting advance between said means and said grinding wheel, a support for optical apparatus including a long tube, lenses in the tube, a light source at one end of the tube, a photoelectric cell fixed with relation to the support and located with respect to the light source and the lenses so that it will conditionally receive light from the source via the lenses, means for altering the cutting advance of the work piece, and amplifying means responsive to the photoelectric cell operating the means for altering the cutting advance, the support being so located with relation to the means for holding and rotating the work piece that an oversized work piece intercepts some of the rays from the light source and at a particular size of the work piece the photoelectric cell is energized.

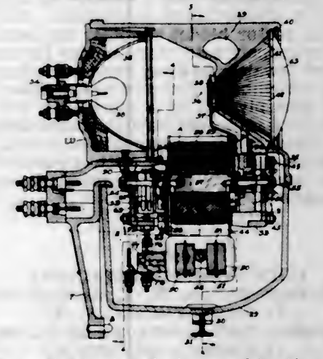
2,097,784

CALIPERING APPARATUS

Raymond A. Cole, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application May 21, 1936, Serial No. 80,949
1 Claim. (Cl. 51—165)

A grinding machine comprising a rotatable grinding wheel and a work support which are movable relatively towards and from each other, a feeding mechanism to cause such relative



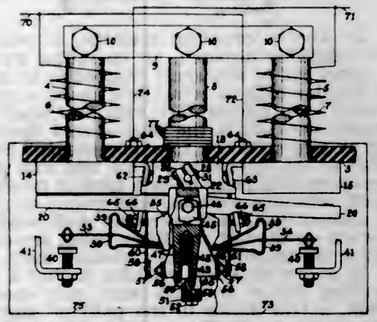
movement, a gauging device including a work engaging feeler having an arcuate work contacting portion arranged continuously to engage the work during grinding, which device controls said feeding mechanism, means actuated by movement of said feeler as the work is reduced in size to move said gauging device away from the work when the work has been ground to a predetermined size moving said device in a direction substantially that of a segment of the arcuate portion of the feeler, and further means acting substantially simultaneously with said last named means to move the arcuate work engaging feeler in a direction substantially radial of said arcuate contacting portion.

2,097,785

LIGHT SIGNAL FOR RAILROADS

Oscar S. Field, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.

Application July 23, 1930, Serial No. 470,056
5 Claims. (Cl. 177—329)



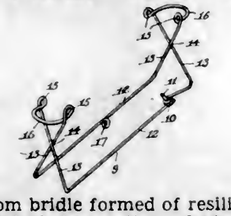
1. In a light signal, in combination with a light source, a conical tube positioned to allow light from the source to pass through it from the small to the large end, to the outside of the signal, and longitudinal corrugations on the inner surface of said tube for diffusing light entering the same from the outside before such light can reach the light source.

2,097,786

RELAY

Oscar S. Field, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.

Application March 19, 1935, Serial No. 11,838
13 Claims. (Cl. 172—126)



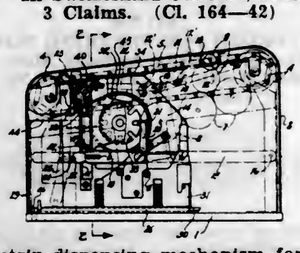
1. In a relay of the oscillating armature type, a pivoted armature, two electro-magnets one on each side of the pivotal axis of the armature whereby the armature is swung in one direction or the other according to the selective energization of the electro-magnets, a contact-operating arm for effecting alternate energization of the electro-magnets, an actuating arm on the armature, a rigid biased toggle link operatively connecting the contact-operating arm and the actuating arm, said toggle link being arranged to snap operate the contact-operating arm only during the latter quarter portion of the travel of the actuating arm and in an opposite direction to said travel.

2,097,787

BROOM GUARD OR BRIDLE

Albert D. Fiveshilling, Boston, N. Y.

Application September 3, 1936, Serial No. 99,255
3 Claims. (Cl. 15—170)

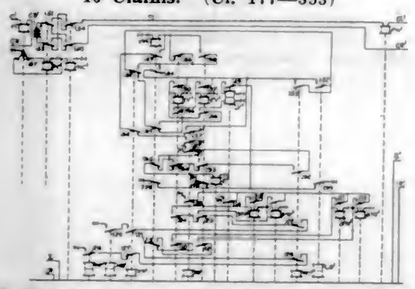


3. A broom bridle formed of resilient wire bent at two points between its ends to form saddle members adapted to embrace the edge of a broom-head, coils at the inner ends of each of said saddle members, crossed end members extending from the coils at each end of said bridle, and side members connecting said crossed end members, one end of said wire being provided with an eye at one of said side members and the other with a stud adapted to be passed through said eye and extend beyond the latter, said side members being held in definitely spaced relation under the action of said saddle members with sufficient force to clamp a broom-head from opposite sides when placed therebetween, said stud being adapted to engage the opposite side member to hold both members in closely related position when the bridle is removed from the broom.

2,097,788

STRIP DISPENSING MECHANISM

Carl Fürrer, Guggithal, Zug, Switzerland, assignor to Landis & Gyr, A.-G., Zug, Switzerland, a corporation of Switzerland

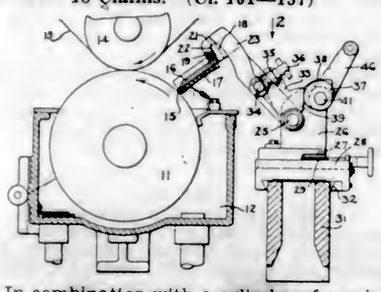


Application June 19, 1934, Serial No. 731,241
In Switzerland June 23, 1933
3 Claims. (Cl. 164—42)

3. A strip dispensing mechanism for dispensing tickets, stamps and the like, including in combination a closed casing, and within the casing a strip supply magazine, a drum rotatably mounted with the magazine for guiding and feeding a strip issuing from the magazine, selecting means and cooperating devices mounted externally of the magazine but connectible with said drum for moving the drum different amounts for dispensing various selected lengths of strip from the magazine, strip-cutting means, said

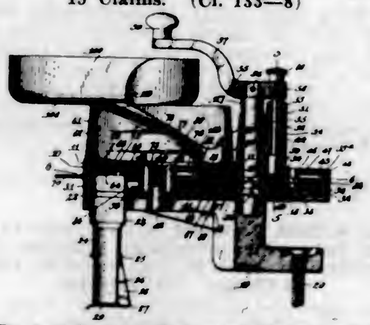
magazine forming an assembled unit which is removable from and insertible into the casing and means automatically operable by said magazine upon its removal for locking said drum against rotation when the magazine is removed.

2,097,789
CENTRALIZED TRAFFIC CONTROLLING SYSTEM FOR RAILROADS
William D. Halles, Brighton, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application July 30, 1935, Serial No. 33,826
10 Claims. (Cl. 177—353)



1. In a remote control system, a control office, a first station and a second station, a primary line circuit connecting said office with said first station, a secondary line circuit connecting said first station with said second station, stepping mechanisms at said office and at said stations, means for operating all said mechanisms in synchronism through a plurality of cycles, means at said second station controlled by said mechanism at that station for applying a first series of impulses to said secondary line circuit during a first one of said cycles to form a code, means at said first station rendered effective by said mechanism at that station for receiving and storing said first series of impulses during said first cycle, means at said first station including said storing means and said mechanism at that station for applying a second series of impulses corresponding to said first series to said primary line circuit during a second one of said cycles to form a duplicate of said code, and means at said control office controlled by said mechanism at the office and responsive to said second series of impulses, whereby distinctive messages are conveyed to said office from said second station.

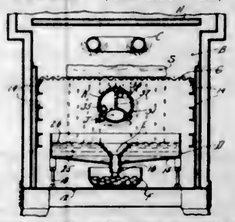
2,097,790
RAISING BRUSH FOR SHEARING MACHINES
Frank H. Hardy, Andover, Mass.
Application March 13, 1936, Serial No. 68,590
2 Claims. (Cl. 15—181)



1. A raising brush for shearing machines comprising in combination a heavy metallic core, a plurality of bristle-clad cylindrical wooden sections of a length substantially approximating their outside diameter and sufficient to receive many hundreds of tufts of bristles, such sections being coaxially mounted on such core end-to-end and rotated thereon relatively to each other to bring the brush into dynamic balance, and means for removably clamping the several sections in operatively immovable relation after the balancing has been accomplished.

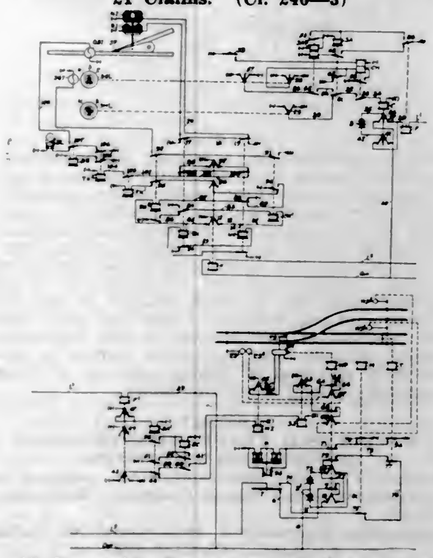
2,097,791
INTAGLIO PRINTING MACHINE
Franz Heller, Long Island City, N. Y., assignor to R. Hoe & Co., Inc., New York, N. Y., a corporation of New York
Application August 3, 1935, Serial No. 34,518
18 Claims. (Cl. 101—157)

1. In combination with a cylinder of a printing machine, a doctor blade mechanism, comprising a flexible doctor blade, a holder for said blade, means to support said blade holder for swinging movement toward and away from said cylinder including, a member connected to the blade holder and an arm pivoted to a stationary part, said member and said arm having cooperating relatively slidable portions, arcuate in form, to adjust said blade angularly with respect to said cylinder, and means to releasably lock said arm to the stationary part.



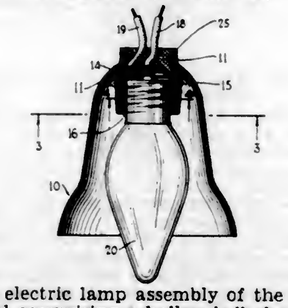
2,097,792
COIN COUNTING MACHINE
Jack W. Hess, Buffalo, N. Y., assignor to Jacob L. Stern, Buffalo, N. Y.
Application April 6, 1932, Serial No. 603,561
15 Claims. (Cl. 133—8)

4. In a coin counting machine, a rotatable shaft vertically disposed, an operating lever at the upper end of said shaft adapted to be moved in a circular path to rotate said shaft, a spring-actuated stop pin parallel with said shaft and normally held out of the path of said operating lever by said spring, a rotatable element having a lifter wedge thereon to elevate said stop pin at a predetermined point in each cycle of movement of said rotatable element, and means to rotate said element from said operating shaft, said stop pin when elevated by said lifter wedge preventing rotative movement of said operating shaft.



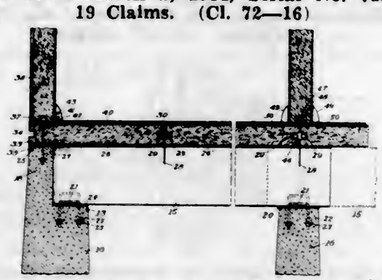
9. In a coin counting machine having a coin-conveying device provided with coin openings therein, a trip device in the path of said coin openings adapted to be controlled in action by coins conveyed in said coin openings, a counter actuating lever associated with said trip device and caused to move into either of two positions under the influence of said trip device, and means rotatable with said coin disk and actuating said counter actuating element only when in one of its two positions.

2,097,793
MEANS FOR COOKING
Carter M. Howell, Los Angeles, Calif.
Application July 9, 1934, Serial No. 734,304
2 Claims. (Cl. 126—41)



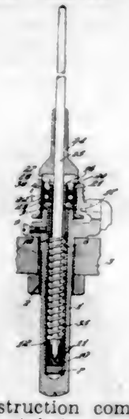
1. Means for cooking food comprising a heating element, means for supporting food above said heating element, means providing a casing above and integral with said heating element, and means for the circulation of a cooling medium through said casing, whereby greases falling from the food toward the heating element are intercepted by said casing and whereby said casing may be maintained at a relatively low temperature so that greases falling thereon and flowing thereover will not readily ignite.

2,097,794
CENTRALIZED TRAFFIC CONTROLLING SYSTEM FOR RAILROADS
Thomas J. Judge, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application July 15, 1932, Serial No. 622,649
21 Claims. (Cl. 246—3)



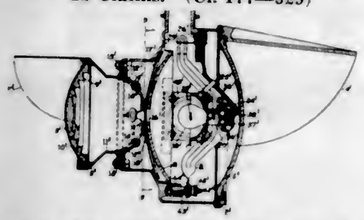
13. In combination, a central office, a distant wayside location on a railway system, two levers in said central office, two polar relays at said wayside location, a line circuit connecting said office and wayside location, and means for causing said line circuit to be temporarily energized by a polarity of current dependent on the position of one of said levers and then be continuously energized by a polarity of current dependent on the position of the other of said levers and including other means for causing one of said relays to be temporarily energized in accordance with said temporary energization of said line circuit and cause said other relay to be energized in accordance with said continuous energization of said line circuit.

2,097,795
ELECTRICAL ILLUMINATING DEVICE
David J. Kelman, Brooklyn, N. Y.
Application December 19, 1935, Serial No. 55,189
3 Claims. (Cl. 240—10)



1. An electric lamp assembly of the character described comprising a hollow bell-shaped shade of insulating material having an integral centrally located socket adjacent the upper end thereof, said socket being provided with an upwardly tapered through opening, said socket having the major portion thereof extending inwardly of said shade, a plurality of circumferentially disposed ridges on said inner socket wall substantially parallel to the axis of said socket and a screw contact shell in said socket, said shell having a flared end provided with means for frictionally engaging said ridges to retain said shell in said socket.

2,097,796
DWELLING ASSEMBLED FROM PREFABRICATED UNITS
James H. Kennedy, Lansdowne, Pa., assignor to Magnesium Cement Laboratories, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application March 2, 1934, Serial No. 713,664
19 Claims. (Cl. 72—16)

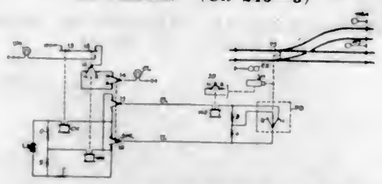


1. In combination in a prefabricated dwelling, a structure and a ceiling hung therefrom comprising a plurality of panels with grooves in adjacent edges, and means for supporting said panels comprising a preformed spline cemented in the grooves of adjacent panels and a suspension device connecting the spline and structure.

2,097,797
SPINNING SPINDLE
George H. Magrath, Whitinsville, Mass., assignor to The Whitin Machine Works, Whitinsville, Mass., a corporation of Massachusetts
Application September 7, 1934, Serial No. 743,047
7 Claims. (Cl. 308—152)

1. A spindle construction comprising a fixed support, an elongate tubular member rigidly secured to said support and having a closed lower end, a step bearing loosely mounted in said lower end and movable in paths extending transversely of the longitudinal axis of said tubular member, a blade rotatably supported at its lower end on said step bearing, a cylindrical sleeve, the lower end of which is secured to the upper end of said tubular member and the upper end of which projects beyond the end of said tubular member and surrounds said blade, a whirl secured to said blade and surrounding the upper end of said tubular member and sleeve, antifriction bearing members interposed between the upper end of said sleeve and the inner periphery of said whirl, and a coil compression spring interposed between the lower end of said sleeve and said step bearing, said spring being operative yieldingly to restrain the freedom of movement of said step bearing.

2,097,798
LIGHT SIGNAL UNIT
Edmund W. Moore, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application January 30, 1936, Serial No. 61,589
12 Claims. (Cl. 177—329)

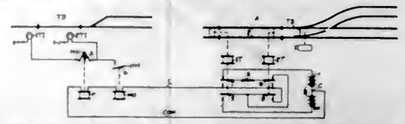


1. In a light signal, in combination, a casing having opposed aligned open ends, a single light source in the casing, two reflecting means positioned to face in opposite directions in the casing, to direct light from said single source simultaneously through the two open ends, one of the reflecting means being as large as either of said open ends, and being apertured, and the other reflecting means being at least equal in size to the aperture and positioned to prevent light from an external source from shining through the casing from open end to open end along the common center line of said open ends.

2,097,799
MANUFACTURE OF SHOES
Harold R. Perry, Swarthmore, Pa., and Chester S. Jennings, Syracuse, N. Y., assignors to The Lamson Company, Syracuse, N. Y., a corporation of Massachusetts
Application September 6, 1934, Serial No. 742,890
3 Claims. (Cl. 12—142)

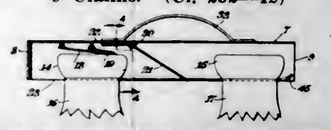
1. The art of manufacturing shoes wherein the shoes are progressively assembled by operations performed at various stations, said shoes in progress containing moisture at the beginning of the assembly operations, characterized in that the shoes are transported by conveyors to and from the stations and that just prior to the arrival of the shoes at certain stations they are conveyed through chambers containing a body of air having a relative humidity of 12% to 20% and maintained at a temperature of 90° to 115° F. whereby the shoes, upon their arrival at such stations, contain that amount of moisture which places them in the most desirable condition for the operations to be performed thereat.

2,097,800
INTERLOCKING SYSTEM FOR RAILROADS
Winfred T. Powell, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application November 24, 1934, Serial No. 754,620
20 Claims. (Cl. 246—3)



20. In combination; a railway traffic governing device having three different positions; a pair of line wires; means for continuously energizing said line wires with current of distinctive character for controlling the distinctive operation of said governing device; an indication means connected to said line wires; and means controlled by said governing device when moved to its different positions to cause changes in the degree of said energization of said line wires and the direction of energization of said indication means, whereby said indication means is distinctively operated to display any one of three conditions of said governing device.

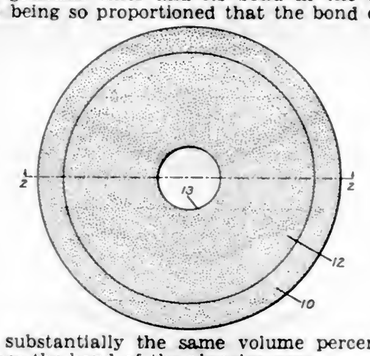
2,097,801
CENTRALIZED TRAFFIC CONTROLLING SYSTEM FOR RAILROADS
Winfred T. Powell, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application September 1, 1936, Serial No. 98,906
1 Claim. (Cl. 246—124)



In a system for indicating traffic conditions, a normally deenergized line circuit connecting a central office and two distant track sections each

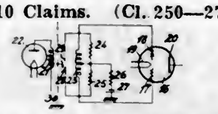
provided with a track relay, a three position polar relay included in series in said line circuit at said office and responsive to the polarity of energization of said line circuit whenever it is energized, a marginal relay at said office included in series in said line circuit and responsive to a relatively high degree of energization and unresponsive to a relatively low degree of energization, a source of energy and a resistor associated with said distant track sections, circuit means including contacts of said track relays for connecting said source and said resistor in series to supply said line circuit with energy of said low degree

of one polarity or the other in accordance with the dropped away condition of one or the other of said track relays or to supply said line circuit with energy of said high degree of said one polarity when both said track relays are dropped away, two indicators in said office, and circuit means including contacts of said polar and marginal relays for energizing one or the other of said indicators when said line circuit is energized to said relatively low degree with said one or said other polarity and for energizing both said indicators when said line circuit is energized to said relatively high degree.



2,097,802
LOCKING DEVICE
Rafael Rivas, New York, N. Y., assignor of one-third to Sidney Weinryb and one-third to Samuel Bluestein, both of New York, N. Y.
Application October 30, 1936, Serial No. 108,340
9 Claims. (Cl. 232—42)

1. In a locking device, a hollow receptacle for supporting an article therein and having an inlet and outlet opening therefor, a gate adjacent said inlet opening and entirely confined within said receptacle, said gate being swingable inwardly towards its open position, a pivotally mounted lever comprising a tongue and an elbow angulated with respect thereto, the tongue being adapted to be operatively actuated by the engagement therewith of said article when positioned within the receptacle, thereby causing a movement of the elbow to a position within the path of said gate, and means for obstructing said outlet opening.



2,097,803
GRINDING WHEEL
Baalis Sanford, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application February 14, 1935, Serial No. 6,441
2 Claims. (Cl. 51—206)

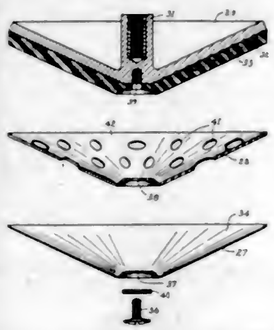
1. A thin cutting off grinding wheel comprising an outer annular abrasive zone of diamond grains and a reacted resinoid bond compacted and proportioned to provide a dense body and a central supporting zone of a granular filler other than diamond and reacted resinoid bond compacted into a rigid support for the outer zone, said granular filler and its bond in the inner zone being so proportioned that the bond occu-

pies substantially the same volume percentage as does the bond of the abrasive zone.

2,097,804
AMPLITUDE FILTER CIRCUIT FOR TELEVISION RECEIVERS
Kurt Schlesinger, Berlin, Germany
Original application October 5, 1934, Serial No. 747,011. Divided and this application May 1, 1936, Serial No. 77,416. In Germany October 11, 1933
10 Claims. (Cl. 250—27)

1. In a push-pull grid current detector arrangement for grid detection, more particularly in the case of a television signal band of large width, modulated on an ultra-short carrier frequency, an input circuit comprising a transformer and a twin-grid detector valve, the primary of said transformer being coupled to the output of a carrier frequency amplifier, the secondary of said transformer being galvanically coupled at its ends to the two grids of said valve and being tuned by its self-induction and by its natural inherent capacities to the highest side band frequency of the modulated carrier frequency band, said valve comprising at least an anode, a cathode, and said two control grids, said cathode being connected to earth, a grid leak resistance connected between a middle tapping point of said secondary and earth.

2,097,805
PORTABLE SIGN
William H. Walsh, Pasadena, Calif.
Application November 6, 1936, Serial No. 109,449
2 Claims. (Cl. 40—125)

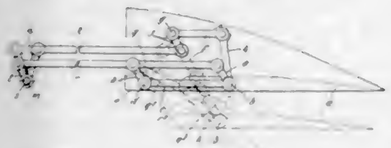


1. A portable sign comprising a board bearing a safety legend on a side thereof, a handle on the board, and an abutment at one end only of the handle, to indicate to a person carrying the sign the relative position of the safety legend.

2,097,806
SURFACING DEVICE
Orrin Weidrich, Kenmore, N. Y.
Application November 23, 1936, Serial No. 112,379
8 Claims. (Cl. 51—197)

1. A rotatable surfacing device comprising a conical shaped supporting member, a layer of

resilient material covering the conical surface of said supporting member, a conical shaped reinforcing disc adapted to fit over said resilient layer, a conical shaped abrasive disc arranged



over said reinforcing member and means for removably securing said abrasive and said reinforcing disc to said supporting member at the apices of said cone surfaces.

2,097,807

MECHANISM FOR ACTUATING THE CONTROL SURFACES OF AIRCRAFT

Robert Talbot Youngman, Aldershot, England, assignor to The Fairey Aviation Company Limited, Hayes, England

Application December 1, 1936, Serial No. 113,657
In Great Britain December 13, 1935
9 Claims. (Cl. 244—42)

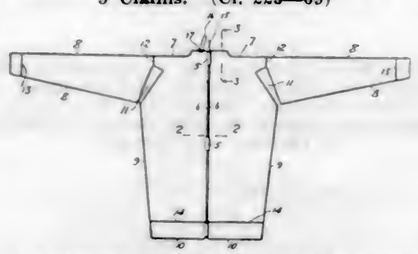
1. Mechanism for actuating the control surfaces of aircraft including a flap mounted so that it is lowered bodily from its normal retracted position to a position below the wing level and turned to a desired extent about a transverse axis at or near the centre of pressure, the bodily lowering and turning movements of the flap being effected independently and either successively or simultaneously, wherein a lever by which the flap is moved to its lowered position is pivoted at its front end on the aircraft wing and is part of a link and lever mechanism comprising said lever, a second lever parallel therewith and also pivoted at its front end on the aircraft wing, and a link connecting the free ends of said levers, said second lever and said link together constituting a toggle or knuckle jointed strut, the elements of which, when the flap is moved to its lowered position, are straightened out to form one side of a triangulated structure, a second side of which is formed by the first lever, and the third side of which is constituted by the wing structure between the pivotal axes of the first and second levers.

2,097,808

SCALP AIR COOLING SYSTEM FOR PERMANENT HAIR WAVING

Joseph Zoberg, West New York, N. J.

Application December 20, 1934, Serial No. 758,347
4 Claims. (Cl. 132—36)



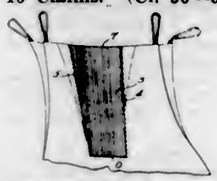
1. In a device of the class described, a plurality of flexible hollow tubular fingers with passages for directing air against the scalp, and means for holding said fingers in position upon the head, while a permanent hair waving apparatus is mounted on the head ready for use, comprising adjustably mounted snap fasteners upon the fingers and engageable with complementary snap fasteners on portions of the hair waving apparatus on the head.

2,097,809

GARMENT STRETCHER

Margaret Burgwin Brock, Muncy, Pa.

Application February 19, 1936, Serial No. 64,674
5 Claims. (Cl. 223—69)



1. A garment stretcher comprising in combination, two halves each forming an arm portion half of a neck portion and half of a body portion in outline, and hinges pivotally securing the two halves together, said halves being provided with openings in the outline between said arm portions and said body portions and extending inward from the side edges of the body portion and of the arm portion of the stretcher to permit garments to enter said openings as said garments are placed on said stretchers.

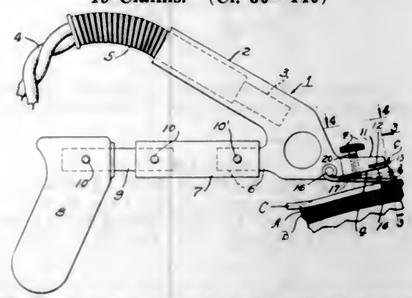
2,097,810

SHOE GORE

Robert T. Dawes, Hudson, Mass.

Application March 23, 1935, Serial No. 12,614
16 Claims. (Cl. 36—51)

2. A shoe comprising a gore of substantially uniform thickness throughout and having a free upper edge, the gore comprising elastic strands



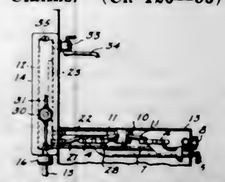
extending substantially parallel to said free edge and all disposed in substantially the same plane, said strands being spaced substantially uniformly apart throughout the gore, the elastic strands adjacent to said edge comprising a greater number of constituent elements than the strands farther from said edge, all of the constituent elastic elements of the several strands being alike in respect to thickness and elasticity.

2,097,811

TIRE GROOVING TOOL

Walter Foley, Los Angeles, Calif.

Application November 3, 1934, Serial No. 751,375
19 Claims. (Cl. 30—140)



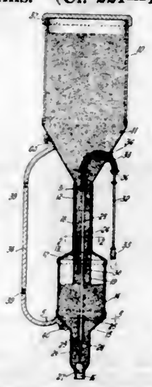
18. In a tire grooving tool, a body member having an upstanding arm portion; an electric heating element connected to said arm portion; a handle member connected to and insulated from said body portion; the forward end of said body member being provided with a slot and a notch; a shoe pivotally connected at one end to said member and being free at its other end and provided with a notch at its free end; a cutting blade provided with a looped portion intermediate its ends and attaching portions extending from the ends of said looped portion, said attaching portions being received in said slot and said looped portion being received in the notch in said body and member and said shoe; and means adjustably secured to said body member and adapted to engage said shoe to vary the distance said looped portion extends below said shoe whereby when pressure is applied against the underside of said shoe the said shoe will be maintained in adjusted position against said adjustable means.

2,097,812

GAS RANGE ATTACHMENT

Walter A. Frantz, Shaker Heights, Ohio

Application March 26, 1934, Serial No. 717,444
8 Claims. (Cl. 126—53)



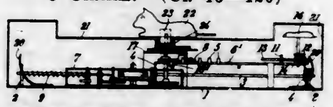
6. A gas stove comprising, a plurality of spaced cooking burners, a constantly operating burner positioned between said cooking burners, a housing having water conducting passages therein positioned adacent to said constantly operating burner to be heated thereby, a storage container in communication with the passages of said housing, means for supporting said container with its top at a substantial distance above said cooking burners, valve means for withdrawing water from said container including a discharge nozzle pivotally mounted for movement over said cooking burners, and means operable to ignite said cooking burners from said constantly operating burner.

2,097,813

DISPENSER

Archie H. Gollings, Akron, Ohio

Application October 14, 1936, Serial No. 105,537
8 Claims. (Cl. 221—113)



1. In a dispenser, in combination, an upper compartment for initially receiving material to be dispensed, a lower compartment adapted to receive material from the upper compartment, and means for regulating the height of the material in the lower compartment while maintaining the relative positions of said compartments.

2,097,814

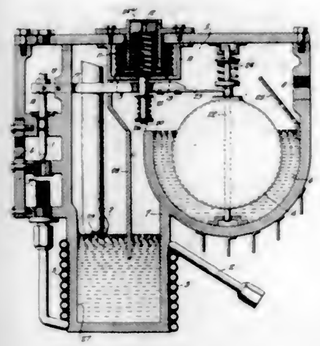
MECHANICAL TOY

Konrad Götz, Furth, Germany

Application March 19, 1937, Serial No. 131,821
In Germany July 29, 1936
3 Claims. (Cl. 46—120)

1. A mechanical toy, comprising in combination with a spring motor, a vertical axle of said motor, a toothed sector keyed on said axle, two horizontal bars having teeth in their inner edge arranged at the right and left of said sector and adapted to be alternately shifted by said sector, rods for guiding said bars, a spiral spring on each rod and acted upon by said bar so that it is put under tension by the corresponding bar during the shifting movement of the same and pulls back said bar into the initial position as soon as it comes out of mesh with said sector, a lateral arm of each bar, a rack and pinion on said bar, an upwardly directed axle of each pinion, a figure for instance a mouse on the top of each axle, and a resilient stop for each of said last mentioned racks to shift them and rotate its pin and the corresponding figure.

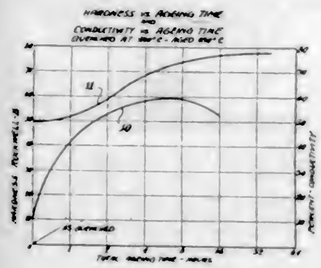
2,097,815



REFRIGERATING APPARATUS

Herbert C. Harvey, Camden, N. J.

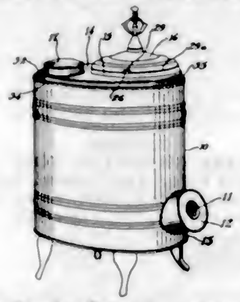
Application October 6, 1934, Serial No. 747,135
7 Claims. (Cl. 62—127)



1. In a refrigerating apparatus the combination of a control valve for high pressure refrigerant,

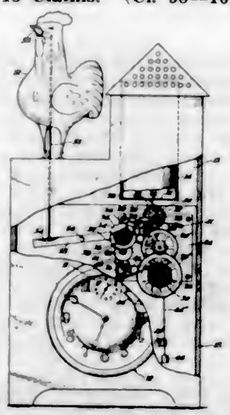
a chamber subdivided into a float chamber and an accumulator chamber and into which low pressure refrigerant is admitted, a float in said float chamber, a bellows externally exposed to the pressure in said chamber and internally to the

atmosphere, a pivotal lever to one end of which the control valve is attached, a spring connection between the other end of the lever and the float, and a lost motion spring connection between the last-mentioned end of the lever and the bellows.



2,097,816
WELDING ELECTRODE
Franz R. Hensel and Earl I. Larsen, Indianapolis, Ind., assignors to P. R. Mallory & Co., Inc., Indianapolis, Ind., a corporation of Delaware
Application June 16, 1936, Serial No. 85,451
1 Claim. (Cl. 219—4)

A welding electrode formed of an alloy containing about 0.1% to 5% zirconium and the balance copper.



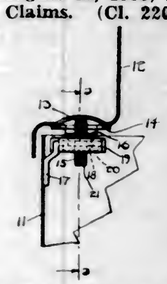
2,097,817
TOP FOR STOVES
Martin L. Hunker, Dover, Ohio, assignor to The Reeves Manufacturing Company, Dover, Ohio, a corporation of Ohio
Application September 6, 1934, Serial No. 742,896
6 Claims. (Cl. 126—217)

1. A sheet metal stove top having a fuel opening therein and an integral collar surrounding said opening, said collar being upwardly and slightly inwardly tapered and terminating in a downturned substantially cylindric flange of slightly less depth than the collar and terminating just above the level of the stove top, a firing door arranged to seat around said tapered collar,

and a hinge for the firing door whereby the door is arranged to be swung upon a horizontal pivot.

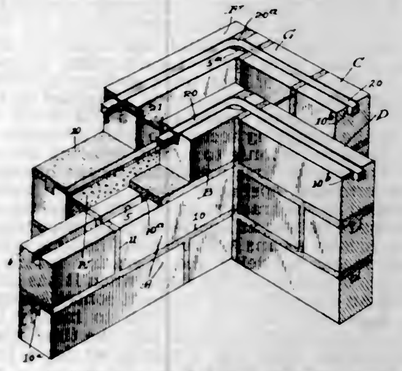
2,097,818
ALARM MECHANISM FOR CLOCKS
Stanley Krakowski, Jersey City, N. J.
Application April 13, 1936, Serial No. 74,063
13 Claims. (Cl. 58—16)

1. A sound alarm device comprising a sounding board, a sound box above the said sounding board, a vibrating reed set into the said sounding board, a rotatable shaft carrying a toothed wheel, the teeth of the said wheel engaging the free edge of the said vibrating reed, means to rotate the said toothed wheel shaft and braking means adapted to stop and release the said shaft for rotation.



2,097,819
CONTAINER
Louis P. Lansing, Cleveland, Ohio
Application November 12, 1934, Serial No. 752,678
10 Claims. (Cl. 62—75)

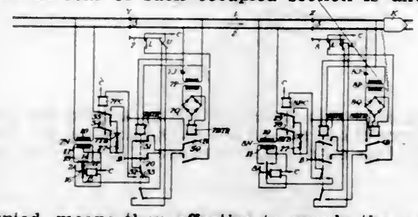
1. A container comprising an outer casing having an open top and a space therein containing a cooling medium, an open topped receptacle within said container and having a foraminous bottom submerged in said cooling medium, and a plurality of trays movably positioned within said



last mentioned container, there being abutments upon the bottom of said receptacle engaged by the lower edges of said trays.

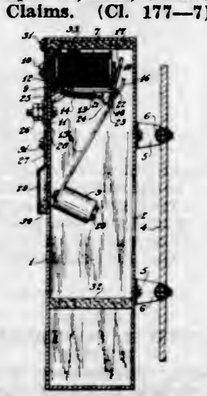
2,097,820
SEALING DEVICE FOR CONTAINERS
Grant H. Lewis, Cincinnati, Ohio, assignor to The Corcoran-Brown Lamp Company, Cincinnati, Ohio, a corporation of Ohio
Application August 13, 1936, Serial No. 95,877
2 Claims. (Cl. 220—27)

2. A sealing device for containers having lid and body elements, consisting of a frangible seal, an adjustable locking pin on said lid for holding the seal in place, and a pin-grip on the body engageable by the pin upon closing the body with the lid, whereby the container may be opened only by breaking the seal to facilitate releasing manipulation of the locking pin.



2,097,821
MASONRY
Horace C. Mathers, Van Nuys, Calif.
Application April 15, 1935, Serial No. 16,438
6 Claims. (Cl. 72—40)

1. A building unit having opposite surfaces constituting bearing surfaces, the unit having a groove in a bearing surface extending the length of the unit and forming ribs at said bearing surface at opposite sides of the groove, slots in one of said ribs adjacent the end of the unit forming a weakened portion of said rib between the slots adapted to be knocked out so as to form a transverse extension of the groove.

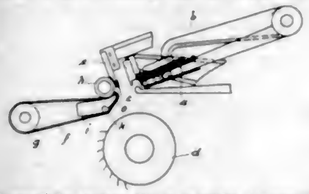


2,097,822
RAILWAY SIGNALING
George R. Pflasterer, Swissvale, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application July 18, 1936, Serial No. 91,418
13 Claims. (Cl. 246—50)

1. A railway signal system comprising a plurality of sections of railway track, means effective when one section is occupied to supply the rails of the section next in rear of such occupied section with only direct current of one polarity, means then effective to supply the rails of the section second in rear of such occupied section with alternating current simultaneously with direct current of said one polarity provided the section next in rear of such occupied section is unoc-

cupied, means then effective to supply the rails of the section third in rear of such occupied section with only direct current of the other polarity provided the second section in rear of such occupied section is also unoccupied, and traffic governing means for each section selectively responsive to the character and number of currents supplied to the rails of the associated section.

2,097,823
ELECTROMAGNETIC DEVICE
William C. Roe, Elyria, Ohio, assignor to Robert B. Brewer, Cleveland, Ohio
Application April 28, 1934, Serial No. 722,936
3 Claims. (Cl. 177—7)



3. A striker device for musical instruments and the like including an electromagnet, an armature support associated therewith and extending below and beyond one end thereof, a striker suspended from the support and in slidable engagement therewith, said striker having an armature portion extending above the support and movable in the magnetic field of the electromagnet when the latter is energized, that portion of the striker which is suspended below the support being provided with a weighted mass.

2,097,824
COMBING MACHINE FOR WOOL, COTTON AND THE LIKE
Karl Josef Schmitt, Chemnitz, Germany, assignor to Sächsische Textilmaschinenfabrik vorm. Rich. Hartman Aktiengesellschaft, Chemnitz, Germany
Application March 16, 1936, Serial No. 69,183
In Germany April 18, 1935
3 Claims. (Cl. 19—120)

1. A drawing off or detaching device for comb-

ing machines, comprising in combination an endless travelling belt, rollers guiding said belt, a block and a protruding lip on said block on the

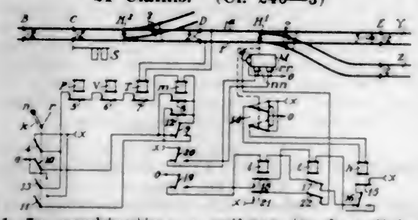
detaching side extending partly around the periphery of one of said rollers and adapted to press the fibres onto a large surface of said travelling belt.

2,097,825

COFFEE MAKER STOVE

Frank E. Wolcott, West Hartford, Conn., assignor, by mesne assignments, to The Silex Company, a corporation of Connecticut (1936)

Application April 26, 1934, Serial No. 722,500
22 Claims. (Cl. 219—43)



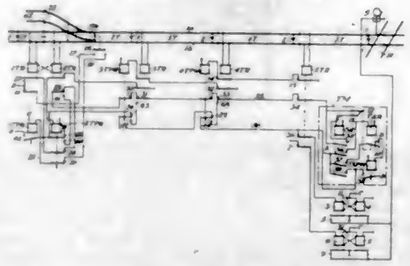
1. In a coffee maker stove, a plurality of means for supporting bowls during heating and having non-adjacent curved sides, and a casing carrying said means in spaced relation and having curved portions supporting said means and substantially conforming to the non-adjacent sides of said means.

2,097,826

RAILWAY SWITCH CONTROLLING APPARATUS

Henry S. Young, Wilkinsburg, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application November 24, 1934, Serial No. 754,616
Renewed March 31, 1937
21 Claims. (Cl. 246—3)



1. In combination, a railway track switch, a polarized relay having a neutral armature and a polar armature, means manually controlled and also controlled by said polar armature for energizing said relay for operating said neutral armature, other means manually controlled and also controlled by said neutral armature for energizing said relay for operating said polar armature from each of its extreme positions to the other, locking means for at times rendering said other means ineffective to energize said relay, and switch operating means controlled by said polarized relay for moving said switch from each of its extreme positions to the other.

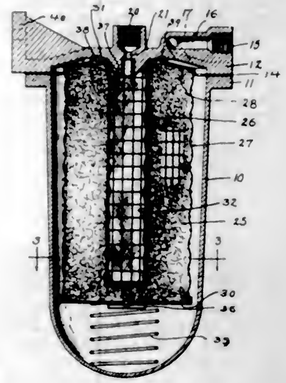
2,097,827

APPARATUS FOR THE CONTROL OF HIGHWAY CROSSING SIGNALS

Henry S. Young, Wilkinsburg, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application July 28, 1936, Serial No. 93,029
13 Claims. (Cl. 246—130)

1. In combination, a stretch of railway track intersected by a highway and comprising a track switch to permit a train to approach the crossing from either of two diverging routes, a highway crossing signal located at the crossing, a first and a second timing track section and an operating track section arranged in the order named between the switch and the crossing with the first timing section at the switch and including portions of the track rails of each route, a track circuit for each of said track sections including a track relay, operating means controlled by the relay of the second timing section and by the relay of the operating section to start operation of the signal in response to a train entering the respective section, time measuring means having a predetermined operating time, circuit means governed by the track relay of each of the timing sections to initiate an operation of the time measuring means, means controlled by the time measuring means to delay the operating means in starting operation of the signal when it has completed an operation, and a circuit controller having connection with the switch to modify the control of said circuit means over the time measuring means when the switch is set for a particular one of the routes.



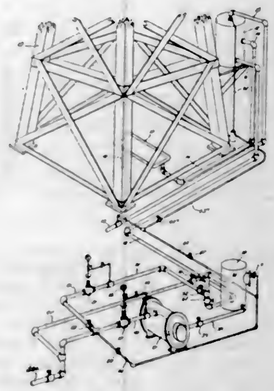
2,097,828

OIL FILTER

Jesse A. Baldwin, Spooner, Wis.

Application October 15, 1936, Serial No. 105,818
5 Claims. (Cl. 210—131)

1. A filter comprising a casing having one end open; a removable head closing said casing having an inlet and a central, vertically disposed outlet, and an annular channel located between said inlet and outlet; a filter element including a top cap member having a central opening in communication with the outlet and a circular bead to engage in said channel, inner and outer screens operatively related to the top cap member, and filtering material located between the inner and outer screens; cooperating means on said head and cap member operative to center the filter element with respect to the head and casing; and spring means arranged between the casing and



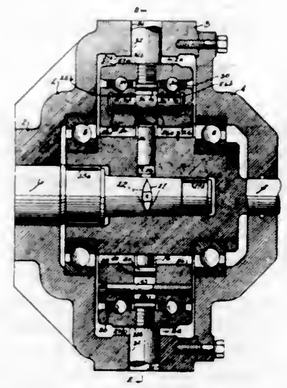
the filter element and operative, in conjunction with the centering means, to maintain the filter element centered and yieldingly to maintain the bead of the top cap member seated in the channel.

2,097,829

APPARATUS FOR MEASURING OIL OR THE LIKE

Carlos J. Bassler, Alhambra, Calif., assignor to American Liquid Meter Company, Alhambra, Calif., a corporation of Washington

Application February 20, 1934, Serial No. 712,166
Renewed September 29, 1936
4 Claims. (Cl. 73—199)



1. In combination, a gas-liquid separator receiving the fluid produced by an oil well, a meter, a gas eliminator connected with the separator and having means to pass liquid to the meter, a pressure regulator controlling the passage of fluid from the meter to a yard pipe line, said regulator being adjustable to vary the back-pressure through the meter but, removed from the meter, and a by-pass bridging the eliminator. meter and regulator, an adjustable valve in the by-pass, the opening of which is dependent upon a predetermined pressure in advance of the eliminator.

2,097,830

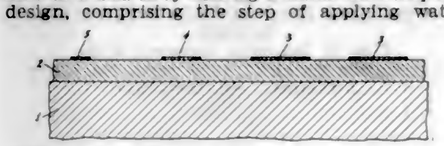
VARIABLE DISPLACEMENT PUMP OR MOTOR

Elek K. Benedek, Bucyrus, Ohio

Application March 27, 1935, Serial No. 13,294
6 Claims. (Cl. 103—161)

1. In a rotary radial piston pump or motor of the character described, including a barrel, circumferentially spaced pistons carried thereby, a reactance rotor eccentric to the barrel for reciprocating the pistons consequent upon concurrent rotation of the barrel and rotor, heads respective to the pistons, each head protruding tangentially of its path of travel in both directions from the piston with which it is associated and having tangential outer bearing surfaces and inner bearing surfaces at the end portions, said surfaces being parallel with respect to each other, load rollers carried by the rotor, each roller being in rolling engagement with the outer face of the piston head with which associated normally at the axis of the particular piston for moving the piston on the pressure stroke while permitting tangential oscillation of the head with respect to the reactance rotor, torque transmitting rollers carried by the rotor and engaging the inner bearing surfaces of the heads respectively for moving the piston on the suction stroke, each head being concurrently in rolling engagement with both the outer and inner rollers associated therewith, additional torque rollers carried by the rotor and engaging the outer surface of the heads respectively adjacent the zone of the said inner rollers, said additional rollers being spaced from the inner rollers a distance slightly greater than the radial thickness of the portion of the head received therebetween for permitting free deflection of portions of the head and for guiding the head while in the deflected condition.

2,097,831



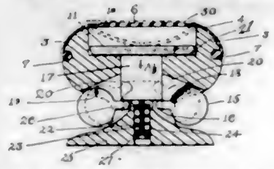
SURFACE PRINTING PLATE, MORE PARTICULARLY OFFSET-PRINTING PLATE AND THE PROCESS FOR PRINTING THEREWITH

Willem Anthonius Boekelman, Bilthoven, and Alberthus Elfers, Haarlem, Netherlands

Application January 30, 1935, Serial No. 4,191
In the Netherlands February 15, 1934
11 Claims. (Cl. 41—41.5)

11. Method of printing from a printing form for offset printing having a closed smooth sur-

face of a lead alloy bearing a metal ink-receptive design, comprising the step of applying water



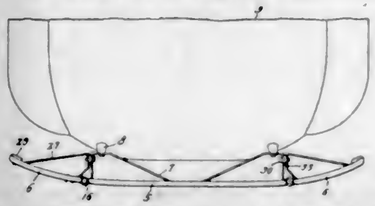
directly to the closed smooth surface of a lead alloy.

2,097,832

LENS MARKER

Jack L. Brenner, Utica, N. Y., assignor to Shuron Optical Company, Inc., Geneva, N. Y., a corporation of New York

Application April 7, 1937, Serial No. 135,537
6 Claims. (Cl. 101—35)



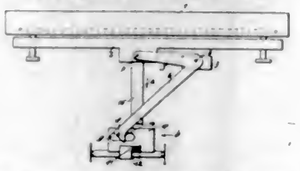
1. In a lens marker, a standard, a rubber band mounted to said standard, another member mounted within said standard for supporting said rubber band when inking the same and levers for moving said supporting member in contact with said rubber band.

2,097,833

AUTOMOBILE SAFETY BUMPER

Earl L. Daily, Columbus, Ohio

Application November 16, 1936, Serial No. 111,107
1 Claim. (Cl. 293—55)



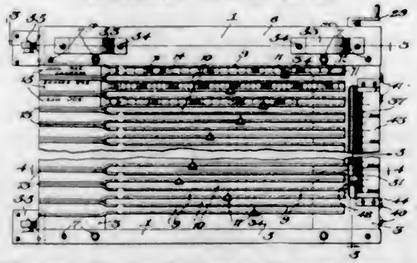
In an automobile bumper, a central section having at one end thereof a pair of vertically aligned hinge lugs, an end section having at one end thereof a similarly disposed pair of hinge lugs between which the hinge lugs of the central section are located, a cylindrical casing having end closure caps and disposed between the lugs of the central section in end engagement therewith, said casing having a slot therein extending throughout the length thereof, a hinge pintle extending through said lugs, caps and casing, and having a longitudinally disposed slot therein co-extensive in length with the casing slot, a convolute spring surrounding said pintle in said casing and co-extensive in width with the length of said casing, said spring having one end anchored in the slot of the pintle and its opposite end extending through the slot in the casing and secured to said end section to thereby tension the latter against rearward swinging movement, and a pair of angle brackets on said sections, respectively, coacting to limit forward swinging movement of said end section under the urge of said spring.

2,097,834

PAPER CARRIAGE ESCAPEMENT DEVICE FOR TYPEWRITERS

Fritz Eibert, Munich, Germany, assignor to Robert Wolff, Basel, Switzerland

Application April 16, 1934, Serial No. 720,684
In Germany April 19, 1933
5 Claims. (Cl. 197—87)



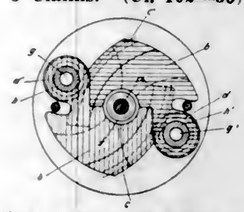
1. In a typewriting machine having key and type levers and a spring-powered ratchet wheel, the combination comprising a universal bar actuated by depression of a key, a pawl carrier actuated by said universal bar, a detaining pawl mounted on said pawl carrier normally engaged by a tooth of said ratchet wheel, a bell crank lever pivoted on a stationary part of said typewriting machine having one of its ends connected to said universal bar and its other end protruding into the path of a tooth of said ratchet wheel whereby said lever is displaced and said universal bar and said key lever are returned to their normal position of rest when the end of said lever is engaged by one of the teeth of said ratchet wheel.

2,097,835

FUEL OIL DELIVERY CONTROL INDICATOR

Frank A. Epps, Westfield, N. J., assignor to Gulf Oil Corporation, a corporation of Pennsylvania

Application March 11, 1936, Serial No. 68,351
16 Claims. (Cl. 116—135)



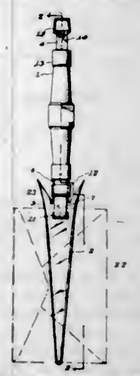
16. An indicator for use in showing consumption of fuel and the like and adapted to show the effect of change of one variable quantity upon a plurality of other variable quantities, comprising a plurality of separate and independently replaceable charts having different scales representing the other variable quantities, means for supporting said charts and index means movable with respect to the charts, the index means being so constructed and arranged as to be moved independently of each other and the scales being so spaced that movement of the index means a given equal distance over the scales, shows on all the charts the effect of the change in the first-named variable quantity upon said second quantities, the chart supporting means being so constructed and arranged that each individual chart can be removed and replaced by another while keeping the index means in position, and means for moving the index means over the charts by equal increments of movement while preserving the relative positions of the several index means.

2,097,836

MECHANICAL TIME FUSE HAVING A CENTRIFUGAL DRIVE

Helmut Junghans, Schramberg-Sulgen, Germany

Application November 11, 1936, Serial No. 110,355
In Germany July 27, 1935
5 Claims. (Cl. 102—36)



1. In a time fuse, a centrally disposed fuse shaft, a pair of centrifugal members disposed symmetrically to the said shaft, and transmission members each driven by one of the said centrifugal members, the said transmission members each being mounted about the axis of rotation of the opposite centrifugal member.

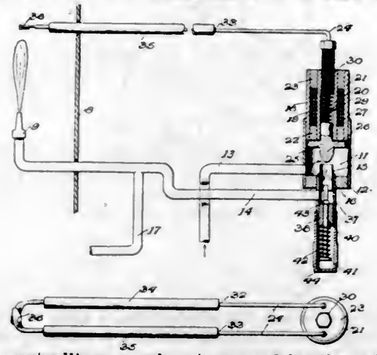
2,097,837

COMBINED LETTER OPENER AND POSTAGE SCALE

Jacob Kaplan, Washington, D. C.; Esther Kaplan, administratrix of said Jacob Kaplan, deceased, assignor to Esther Kaplan, Washington, D. C.

Application January 15, 1936, Serial No. 59,301
4 Claims. (Cl. 265—63)

1. In a device of the class described, a hollow elongated body, a flat knife-like member projecting from one end of the body in substantial axial alignment with said body, a spring scale mounted within said body and adapted to support said body in weighing relation, a clamp, means to cause said clamp to bear against said member, said clamp and member being adapted to hold a letter with the letter supported against said knife-like member.



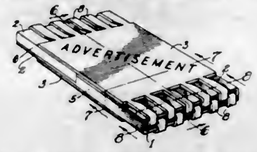
2,097,838

SAFETY DEVICE FOR GAS BURNERS

Sebastian Karrer, Washington, D. C., assignor to Consolidated Gas Electric Light and Power Company, Baltimore, Md., a corporation of Maryland

Application June 30, 1931, Serial No. 547,977
4 Claims. (Cl. 175—181)

1. In a device of the character described, in combination with an electromagnet having an armature connected to a controlling member, a thermocouple adapted to be subjected to the heat of a flame and electrically connected with said electromagnet whereby said armature and member are held in operating position by the thermoelectric current flowing through said electromagnet as long as said thermocouple is heated by said flame but on extinguishment of said flame



said controlling member is moved by the release of said armature by said electromagnet, and means in said thermoelectric circuit for assuring release of said armature by said electromagnet by demagnetization of said electromagnet and including a junction of said thermocouple adapted upon extinguishment of the flame to cool more slowly than the junction normally subjected to the flame.

2,097,839

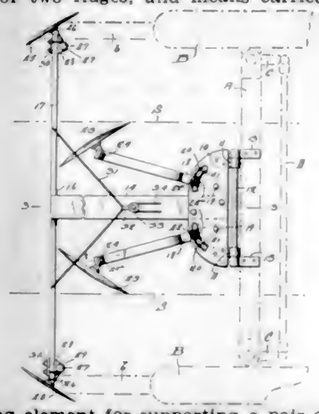
MATCH PACKET

John C. Leukhardt, Washington, D. C.

Application March 30, 1937, Serial No. 133,874
5 Claims. (Cl. 206—29)

1. A device of the class described comprising a channeled partition member having slideways, a cover member and a match splint carrier plate, all arranged to be assembled in a compact match packet, and a plurality of match splints housed between said partition member and said cover member and integrally attached to opposite edges of said carrier plate, said splints being weakened at the point of attachment and arranged for individual detachment from said carrier plate, and said splints being doubled backwardly over opposite edges of said cover member and arranged to lie in respective slideways of said partition member with said cover member disposed between said carrier plate and partition member.

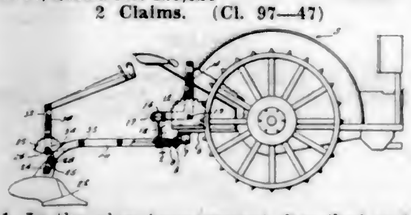
2,097,840



TRACTOR GUIDE

Donald A. Olmsted, Waunata, Nebr.

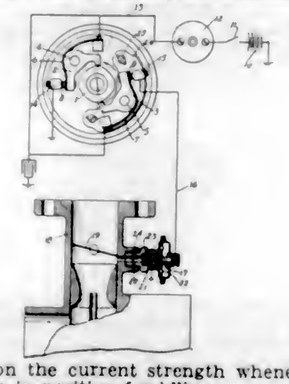
Application December 31, 1936, Serial No. 118,656
8 Claims. (Cl. 97—49)



1. The combination with a tractor having a front axle and rubber-tired wheels thereon, of a guiding element attached to the axle and extending forward therefrom and including means for supporting a pair of guiding members on

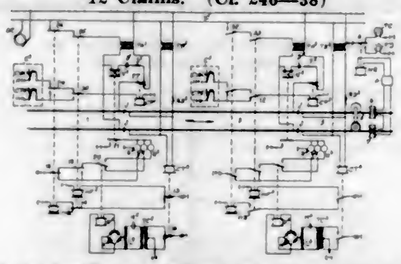
each side of the middle line of the tractor in position to engage against the confronting shoulders of two ridges, and means carried by said

guiding element for supporting a pair of furrow forming members immediately in advance of the tractor front wheels.



2,097,841
TRACTOR PLOW
Elmer William Park, near Fredericksburg, Va.
Continuation of application Serial No. 80,590, May 19, 1936. This application February 12, 1937, Serial No. 125,520
2 Claims. (Cl. 97—47)

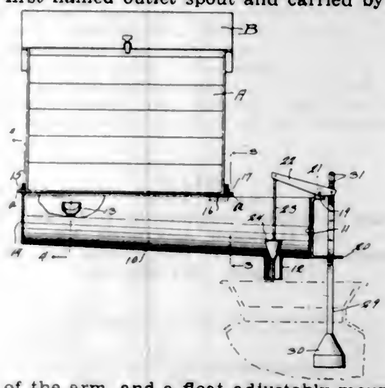
1. In the plow improvement described and in combination, a plow having an upstanding flange, a plow beam, bracket arms fixed to and extending upwardly from said flange of the plow, one of said arms having an upstanding segmental rack fixed thereto, a lever alongside said rack and having an angular opening in its end portion and also having a detent complementary to said rack, a transverse bolt journaled and secured in position in said bracket arms and having between said arms and alongside each other an eccentric and an angular part, the latter disposed in the angular opening of the lever, and a link having a circular opening receiving said eccentric, said link extending forwardly from the eccentric and pivotally connected to the beam at an intermediate point in the length of the latter.



2,097,842
IGNITION CONTROL DEVICE
Bernard C. Phillips, Detroit, Mich., assignor, by mesne assignments, to The Mallory Research Company, Detroit, Mich., a corporation of Michigan
Application March 29, 1935, Serial No. 13,731
5 Claims. (Cl. 123—117)

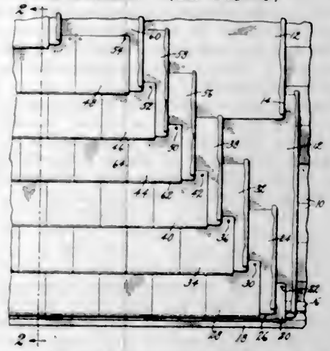
1. The combination with an ignition circuit for an internal combustion engine, of means responsive to a predetermined increase in the vacuum of the engine intake to reduce the strength of the current in said circuit, and an engine throttle operable to nullify the influence of the

vacuum on the current strength whenever said throttle is in position for idling.



2,097,843
RAILWAY SIGNALING SYSTEM
Wade H. Reichard, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.
Application December 28, 1935, Serial No. 56,488
12 Claims. (Cl. 246—38)

1. In a railway signaling system, a plurality of track sections, means for applying spaced direct current impulses to the exit end of each section, means selecting the rate of said impulses in accordance with traffic conditions a track relay at the entrance of each section operated by the direct current impulses, wayside signals at each section, means for controlling the wayside signals in accordance with the rate of operation of the associated track relay, a source of alternating current connected at the entrance end of each section, and an alternating current relay intermittently connected to the exit end of each section for controlling the energization of the associated wayside signal.



2,097,844
AUTOMATIC CAN FILLER
Guilford D. Robinson, Eden, N. Y.
Application February 11, 1937, Serial No. 125,335
5 Claims. (Cl. 226—127)

1. A can filler, including a trough having an outlet spout at one end and a second outlet spout adjacent the other end of the trough, one end of the trough having an end wall formed with a slot, a cross bar mounted upon the trough and shiftable toward or from the end wall and having a corresponding slot whereby the trough may be engaged with lugs on a cooling tank, an arm pivotally supported at one end of the trough, an upwardly opening valve controlling passage through the first named outlet spout and carried by one

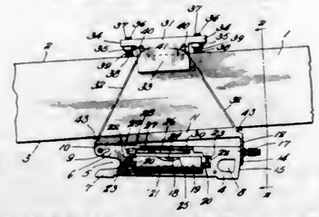
end of the arm, and a float adjustably mounted upon the other end of the arm exteriorly of the trough.

2,097,845
ROOFING
Lancy Snow, Noroton, Conn.
Application June 26, 1934, Serial No. 732,396
2 Claims. (Cl. 108—9)

1. A roof the major portion of which is covered by slate of a single thickness underlaid by a dual thickness of roll roofing felt, said roll roofing felt being laid in smooth strips with individual slate shingles independently applied thereupon in a manner to form a course, said slate shingles being disposed in slightly overlapping staggered relation to the slate shingles of an adjacent course, and each strip of roll roofing felt having its lower portion substantially co-extensive with the bottom line of the course of slate shingles and its upper portion above the upper line of the next superposed course of slate shingles.

2,097,846
NASAL INHALER
Clauss Burkart Strauch, New York, N. Y.
Application December 31, 1935, Serial No. 56,904
5 Claims. (Cl. 128—198)

1. An article of the character described comprising a substantially conical imperforate open ended tubular shell formed from thin cellulosic sheet material and being light, smooth, flexible and non-absorbent, the shell being provided at its large end with an annular flange extending outwardly away from the axis of the shell, a filling of absorbent material positioned within the shell, the small end of the shell being provided with an annular lip extending inwardly into the bore of the shell and engaging the filling to

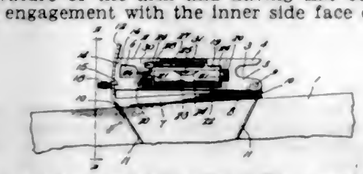


prevent the latter from reaching the small end of the shell, said outwardly extending flange being eccentrically arranged relatively to the axis of the shell.

2,097,847
METHOD OF PREVENTING EROSIONS AND PERFORATIONS IN METAL CONTAINERS
Clauss Burkart Strauch, New York, N. Y.
No Drawing. Application May 29, 1936, Serial No. 82,623
8 Claims. (Cl. 99—182)

1. A method for preventing erosions and perforations in metal containers comprising substantially saturating the material packed in the metal container with salts, corresponding to the salts formed in time by the natural reaction between the material and container.

2,097,848
LEVEL AND SUPPORT THEREFOR
John E. Torbert, Jr., National City, Calif.
Original application September 16, 1935, Serial No. 40,833. Divided and this application December 11, 1936, Serial No. 115,436
6 Claims. (Cl. 33—207)

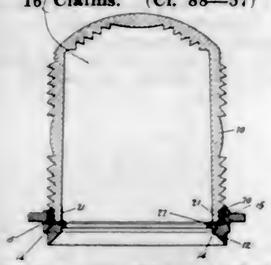


1. A straight edged bar of a length adapting it to be applied in spanning relation to spaced objects, a level applicable to a straight edge face of said bar and having notches at its ends, and means for detachably securing the level to the bar consisting of a yoke having a portion U-shaped in cross section and straddling the bar at the opposite side thereof from the level, plungers slidably carried by said yoke and yieldably held in position to bear against an edge face of the bar with the yoke urged away from the bar, and loops carried by said yoke to engage about the bar and through the notches in the ends of the level to securely but detachably hold the level in place.

2,097,849
ADJUSTABLE LEVEL
John E. Torbert, Jr., National City, Calif.
Original application September 16, 1935, Serial No. 40,833. Divided and this application December 11, 1936, Serial No. 115,437
1 Claim. (Cl. 33—213)

A level comprising a body, an indicator carried by said body, a bar extending longitudinally of said body under the same and at one end pivoted to the body whereby the body may be tilted upwardly to angularly adjusted positions relative to the bar, an arcuate arm carried by and projecting upwardly from the other end of the bar along the edge face of the free end of

the body and formed with a longitudinally extending slot confronting the edge face of the free end of the body, the said free end of the body having an arcuate edge face conforming to the curvature of the arm and having flat contacting engagement with the inner side face of said



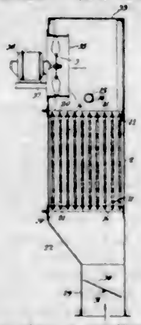
arm, a stem projecting from the arcuate edge face of the free end of said body through the slot of said arm, and a fastener threaded upon said stem for gripping the arm when tightened and releasably securing the body in an angularly adjusted position.

2,097,850

SEALING JOINT AND METHOD OF MAKING THE SAME

Charles F. Wallace, Westfield, N. J., assignor to Wallace & Tiernan Products, Inc., Belleville, N. J., a corporation of New Jersey

Application August 10, 1935, Serial No. 35,686
16 Claims. (Cl. 88—57)



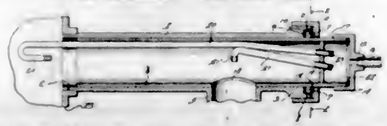
1. A joint for connecting spaced members of which at least one is frangible, comprising an element of resilient material in the space between said members, and a metallic element of low melting point in the space between said members and sealing said resilient element against outer exposure.

2,097,851

AIR COOLER

Richard Wenzl, Freiburg, Germany

Application April 22, 1935, Serial No. 17,707
In Germany April 26, 1934
6 Claims. (Cl. 257—244)



2. In an air cooler, a cooling unit, flat cooling elements each comprising a pair of parallel flat walls, arranged in said unit to define air ducts by the outer surfaces of their parallel flat walls, means for circulating a refrigerant through said cooling elements at such a temperature that the outer surfaces of said walls are maintained at a temperature below zero, means for establishing a flow of air through said air ducts at comparatively high velocity, and bars extending through said unit for holding said elements.

2,097,852

SAND TRAP

William N. Wright, Washington, D. C., and William H. Beach, Alexandria, Va.

Application October 1, 1935, Serial No. 43,116
11 Claims. (Cl. 291—11)

1. A sand trap comprising a body for connection with a sand container and having a delivery pipe in communication therewith, a lining sleeve insertable within the body and having an opening registering with the delivery pipe, a plate intersecting the sleeve, means for placing the sleeve at one side of the plate in communication with a source of air under pressure, a siphon pipe carried by the plate, said siphon pipe being of a length to terminate adjacent to the receiving end of the trap, and a blast pipe also carried by the plate and having a nozzle discharging through the opening in the sleeve.

9. A sand trap comprising a tubular member for communication with a sand container, a sand delivery pipe having communication with the tubular member, a plate intersecting the member, means for placing the member at one side of the plate in communication with a source of fluid under pressure, a siphon pipe in communication with the member at the side just mentioned of the plate, said pipe discharging within the entrance end portion of the member, and a blast pipe in communication with the member at the side of the plate hereinbefore mentioned and discharging into the delivery pipe.

2,097,853

AUTOMOBILE LIFT

Cyrus J. Bristol, Des Moines, Iowa, assignor to Globe Hoist Company, Des Moines, Iowa, a corporation of Iowa

Application March 1, 1937, Serial No. 128,411
2 Claims. (Cl. 254—93)

1. In a hoist, the combination of an upright cylinder open at its upper end, a plunger slidingly mounted in the cylinder and open at its upper end and provided with a lower head spaced above the lower end of the cylinder, the projecting lower end of the plunger being formed with guide openings, two plunger bearings fixed to the cylinder, one at its upper end portion and the other spaced below the first, a screw-threaded rod extended through and rotatably mounted in said piston head, having its upper end shaped to receive an implement for rotating the rod, a nut mounted on the rod below the piston head and arms pivoted to the nut and extended through the openings in the lower end of the plunger, said arms being so shaped that when the nut is at its upper limit the outer ends of the arms will project beyond the plunger and co-operate with the lower bearing on the cylinder to limit the upward movement of the plunger, and when the nut is at its lower limit, the outer ends of said

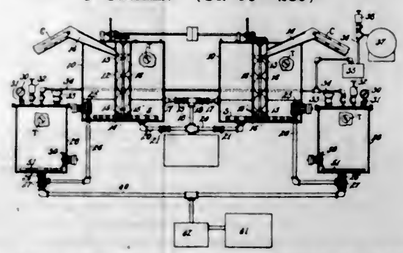
arms will be withdrawn to permit the removal of the plunger from the cylinder.

2,097,854

CYCLOPENTADIENONE CONDENSATION COMPOUNDS AND PROCESS OF MAKING THEM

Walther Dilthey, Bonn-on-the-Rhine, Germany, assignor to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application March 22, 1934, Serial No. 716,905. In Germany March 25, 1933
11 Claims. (Cl. 260—123)



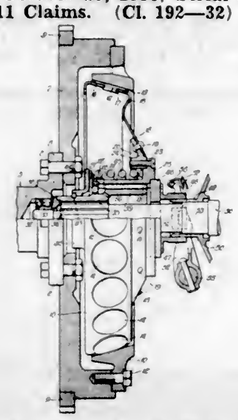
1. The process which comprises heating a cyclopentadienone with a compound of the group consisting of unsaturated compounds of the ethylene and acetylene series.

2,097,855

APPARATUS FOR PRODUCING TOMATO PRODUCTS

Edward C. Eberts, Jeffersonville, Ind., assignor to Stokely Brothers & Company, Indianapolis, Ind., a corporation of Delaware

Original application June 22, 1933, Serial No. 677,110, now Patent No. 1,978,078, dated October 23, 1934. Divided and this application December 18, 1933, Serial No. 702,864
9 Claims. (Cl. 99—239)



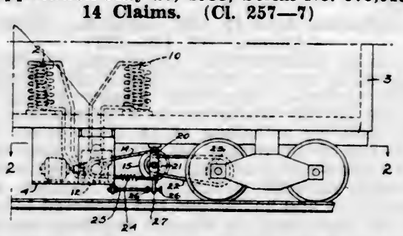
4. Apparatus for mechanically separating juice and pulp of fruits, comprising a tank of substantial depth and capacity, means arranged within the tank near its lower regions by which juices may be liberated from its pulp, conveyor means arranged within the tank and extending from a point above the normal maintainable liquid level within the tank to said separating means and adapted to propel successive fruits downwardly in the liquid content of the tank to said separating means, and means by which the liquid content of the tank may be maintained at a temperature substantially above normal atmospheric temperatures.

2,097,856

CLUTCH

Thomas L. Fawick, Akron, Ohio, assignor to Industrial Clutch Company, a corporation of Wisconsin

Application October 29, 1936, Serial No. 108,156
11 Claims. (Cl. 192—32)



5. A friction clutch of the servo type, comprising a driving member having a conical surface, a driven member coaxial therewith, a clutch member therebetween having a conical rim and having an axially extending internally splined hub spaced radially about said driven member, an intermediate member within said hub for transmitting torque from said hub to said driven member, an abutment plate carried by said intermediate member adjacent one end of said hub, spring means biased between said plate and said hub externally of the axially extending portion of said hub, and within said clutch member, and bearing means carried at the opposite end of said hub and adapted to be engaged by the clutch operating mechanism.

2,097,857

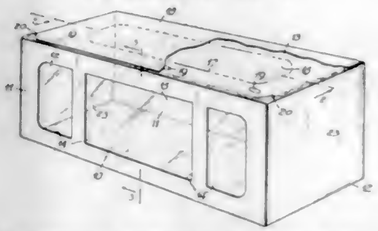
HYDRAULIC TRANSMISSION

Walter Ferris and James K. Douglas, Milwaukee, and George H. Fobian, West Allis, Wis., assignors to The Oilgear Company, Milwaukee, Wis., a corporation of Wisconsin

Application May 26, 1933, Serial No. 673,018
14 Claims. (Cl. 257—7)

9. The combination, with a vehicle and air conditioning apparatus carried by said vehicle

for cooling the interior thereof, a hydraulic motor for driving said apparatus, a heating coil carried by said vehicle to cause liquid forced therethrough to heat the interior of said vehicle, a pump driven by motion imparted thereto from said vehicle for delivering liquid to said motor and said coil selectively, an electric motor for driving said hydraulic motor to cause it to function as a pump, means for connecting said motor into a stationary electric circuit when said vehicle is stationary, and fluid connections for enabling said hydraulic motor to circulate liquid through said coil upon being driven by said electric motor.



2,097,858

BOX FOR DISPENSING TISSUES

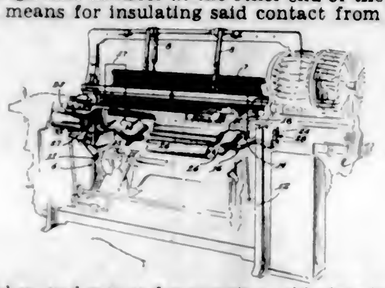
Sol Herz, New York, N. Y., assignor to Federated Mills, Inc., New York, N. Y., a corporation of New York

Application September 15, 1936, Serial No. 100,823

1 Claim. (Cl. 229—17)

A dispensing container of rectangular form comprising a top panel having a center portion enclosed within a continuous weakened line to permit easy removal of said portion in order to form an opening in said top panel, two side walls opposite each other, said side walls being substantially weakened by extensive window cut-outs, said container being folded from a blank having four mid-portion sections to form the bottom, side walls and top, the bottom and the top having end flaps on either side thereof, each of said flaps having the full size of an end wall and being folded inwardly to overlap the corresponding flap of the opposite section, the side wall sections having on either side flaps of half the size of an end wall, said side wall flaps being folded inwardly and sandwiched between the flaps of the top and the bottom section, whereby the endwalls become sufficiently rigid to take up the strain exerted upon the top and the weakened side walls when said removable portion in the top is separated along said weakened line.

2,097,859



ATTACHMENT FOR LOOMS

Walter L. Holt, La Grange, Ga., assignor of one-third to W. H. Young, Sr., Muscogee County, Ga.

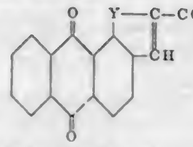
Application April 19, 1937, Serial No. 137,852

4 Claims. (Cl. 139—337)

1. In an attachment for the purpose set forth, a normally inactive circuit closing unit formed of an L-shaped supporting member having a vertical leg for anchoring to a support and a horizontal leg extending at an angle from the lower end of the vertical leg, a contact plate disposed transversely of said horizontal leg, a depressible resilient circuit closing member arranged over and having one end anchored to one end of said plate, a contact normally spaced from and for coaction with said plate when said member is depressed, said contact extending through said member at the other end of the latter, means for insulating said contact from said

member, and means for securing said plate to the horizontal leg.

2,097,860



ANTHRAQUINONE THIOPHENE AND SELENOPHENE CARBOXYLIC ACID COMPOUNDS

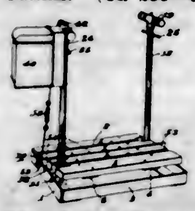
Ralph N. Lulek, Waukesha, and Clarence F. Belcher, South Milwaukee, Wis., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application September 30, 1936, Serial No. 103,348

6 Claims. (Cl. 260—53)

1. An anthraquinone carboxylic acid compound of the general formula

wherein Y stands for an element of the class consisting of sulfur and selenium, and X stands for a substituent of the class consisting of OH and a halogen atom.



2,097,861

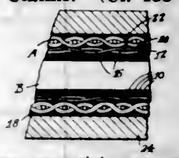
CHECKING DEVICE

Joseph T. Mackay, Woodbury, Conn., and Haviland C. Ames, Port Washington, N. Y., assignors to United Fruit Company, Boston, Mass., a corporation of New Jersey

Application November 29, 1933, Serial No. 700,294

4 Claims. (Cl. 235—99)

1. In a checking device, the combination of a treadle, a frame for supporting the treadle, means for movably mounting the treadle on the frame, a standard pivoted to the frame in proximity to the treadle and adapted to swing from an upright erected position to an approximately horizontal folded position adjacent the tread surface of the treadle, a recess in said tread surface adapted to receive and countersink the standard in folded position, means for locking the standard selectively in its upright or folded positions, a register, means on the standard for detachably supporting the register, and means for removably and actuatingly connecting said register to the treadle.



2,097,862

FIRE HOSE

Hunter McKay, Cambridge, Mass., assignor to Boston Woven Hose and Rubber Company, Cambridge, Mass., a corporation of Massachusetts

Application April 9, 1936, Serial No. 73,463

6 Claims. (Cl. 138—53)

1. A fire hose comprising an outer textile jacket, and an inner tube freely and floatingly disposed therein and including in its structure a rubber ply having a textile ply united thereto and fabricated with relatively inextensible threads extending substantially parallel to the axis of the tube, said threads reinforcing the tube against elongation, and the textile ply being readily expansible with the rubber ply whereby fluid pressure within the tube is effective to expand the tube into close contact with the outer jacket.

2,097,863

LEGUMINOUS FOOD PRODUCT

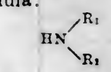
Sidney Musher, New York, N. Y., assignor to Musher Foundation Incorporated, New York, N. Y., a corporation of New York

No Drawing. Application October 2, 1934, Serial No. 746,626

2 Claims. (Cl. 99—98)

1. In the method of preparing beans to produce a product having the characteristics of an oven baked bean, the steps of roasting the substantially whole, dry, non-fatty, edible beans for a period of about 1 to 5 minutes, and steaming the bean to cooked condition whereby a bean simulating an oven baked bean is obtained.

2,097,864



PROCESS OF PREPARING AMINO-CARBOXYLIC ACIDS AND PRODUCTS OBTAINABLE THEREBY

Carl Platz, Frankfort-on-the-Main, and Hermann Holsten, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application July 26, 1935, Serial No 33,388. In Germany July 31, 1934

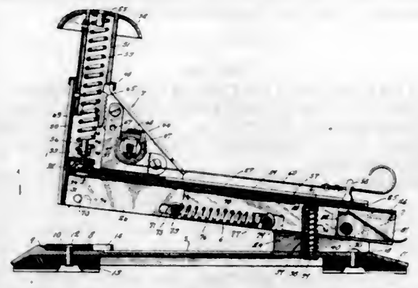
6 Claims. (Cl. 260—112)

1. The process of preparing tertiary amino compounds which comprises alkylating at the nitrogen atom an organic amino compound of the general formula:

R_1 being a member of the group consisting of hydrogen, aliphatic hydrocarbon radicals, aliphatic hydrocarbon radicals containing hydroxyl, aliphatic hydrocarbon radicals containing carboxyl, aromatic hydrocarbon radicals, R_2 standing for a member of the group consisting of aliphatic hydrocarbon radicals of at least 6 carbon atoms, cycloaliphatic hydrocarbon radicals having at least one side chain with at least 3 carbon atoms and hydroaromatic hydrocarbon radicals having at least one side chain with at least 3 carbon atoms, the components taking part in the reaction being chosen so that the final product contains at least one carboxyl group.

6. The new products of the formula:

wherein R stands for an aliphatic hydrocarbon radical with at least 6 carbon atoms, R_1 and R_2 stand for an aliphatic hydrocarbon radical substituted by COOH, in the form of their alkali salts being powders having a greasy feel, dissolving easily even in cold water, being very resistant towards the salts that cause the hardness of water and dissolving in dilute acids, especially in hot dilute acids.



2,097,865

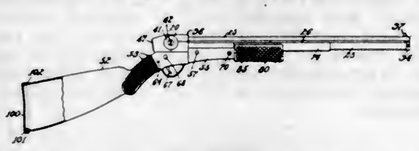
STAPLING DEVICE

Hans C. Stockel, Chicago, Ill., assignor to Hercules Tool & Manufacturing Co., Chicago, Ill., a corporation of Illinois

Application August 15, 1935, Serial No. 36,260

14 Claims. (Cl. 1—3)

1. In a stapling device an arm providing a channel extending longitudinally thereof for storing a supply of staples, staple ejecting mechanism, and a casing housing the mechanism and forming with the arm a passage through which the staples are ejected, said casing being yieldably secured to said arm and bodily removable therefrom.



2,097,866

AIR GUN

Fay M. Tomlinson, Lebanon, Ind., assignor to Arthur M. Hood, trustee, Indianapolis, Ind.

Application August 23, 1933, Serial No. 686,427

8 Claims. (Cl. 124—15)

1. In an air gun, a breech-block having a transverse bore, a bullet-barrel carried by said block, an air-barrel carried by said block, a bullet-magazine, a plug rotatably mounted in said transverse bore of the breech-block, and provided with a U-shaped passage registrable at its ends with the bullet barrel and the air barrel and at its air discharge end with the magazine outlet, and provided with a portion closing the magazine outlet when said passage connects the two barrels, said passage having at its air-discharge end, a bullet seat, a plunger reciprocable

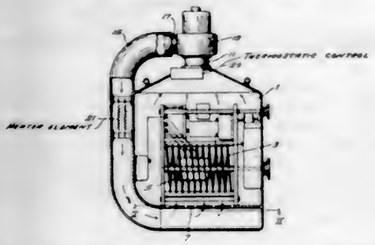
in the air-barrel, a spring acting upon said plunger to drive it toward the breech-block, a hand grip slidable toward and from the breech-block, means carried by the hand-grip for engaging said plunger to move it in opposition to said spring, a latch capable of restraining said plunger in opposition to said spring, trigger mechanism for releasing said latch, and a spring normally urging said plug to bullet-receiving position.

2,097,867

PREPARATION OF ANTHRAQUINONE DITHIAZOLES

Alexander J. Wuertz and William L. Rintelman, Carrollville, Wis., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application November 25, 1935, Serial No. 51,472
2 Claims. (Cl. 260—44)



1. In the process for preparing anthraquinone-1,2,5,6-bis(C)phenyl-dithiazole which comprises fusing 2,6-diamino-anthraquinone with benzotrichloride and sulfur in the presence of a high-boiling solvent, the step which comprises carrying out the reaction in the presence of iodine.

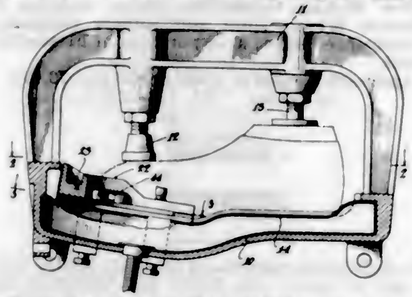
2,097,868

SYSTEM OF TEMPERATURE CONTROL

Joseph G. Beard, Springfield, Mass., assignor to Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Application October 2, 1934, Serial No. 746,519
9 Claims. (Cl. 250—36)

1. In combination, an oscillation generator comprising a tunable resonant frequency determining circuit, a chamber having walls of material having heat-conductivity of the order of the metals enclosing said frequency determining circuit, means for producing a flow of a fluid medium through said chamber and in physical contact with said frequency determining circuit and said walls, means for varying the heat content of said fluid in accordance with heat changes within said chamber tending to alter the frequency of said generator.



2,097,869

WELT HOLDING MECHANISM

William C. Card, Jr., Winthrop, Mass., assignor to Compo Shoe Machinery Corporation, New York, N. Y., a corporation of Delaware

Application October 19, 1934, Serial No. 748,980
10 Claims. (Cl. 12—33)

1. In a shoe apparatus having means for applying pressure to the bottom of a shoe, a welt hold-down device comprising a housing having upper and lower confining plates, platens slidably mounted between said plates in position to engage in the welt crease of a shoe positioned on said apparatus, said plates confining said platens against vertical movement with respect thereto,

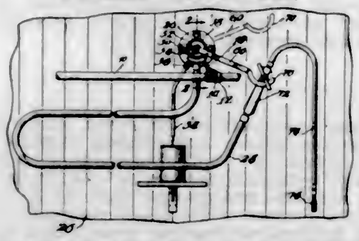
and means for sliding said platens in said housing to accommodate shoes of varying sizes.

2,097,870

WELT SUPPORT

William C. Card, Jr., Winthrop, Mass., assignor to Compo Shoe Machinery Corporation, Boston, Mass., a corporation of Delaware

Application January 6, 1937, Serial No. 119,182
9 Claims. (Cl. 12—33)



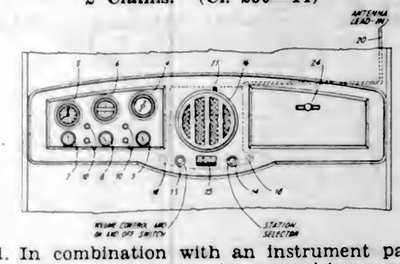
1. A welt support unit adapted to be placed in the welt crease of a shoe during a pressing operation, comprising a pair of relatively movable platens shaped to fit in the welt crease on opposite sides of a shoe, guide means confining said platens to straight-line movement toward and from each other, and spring means urging mutual approach of said platens.

2,097,871

LUBRICATING APPARATUS

Ernest W. Davis, Oak Park, Ill., assignor to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia

Application January 30, 1935, Serial No. 4,073
4 Claims. (Cl. 221—47.1)



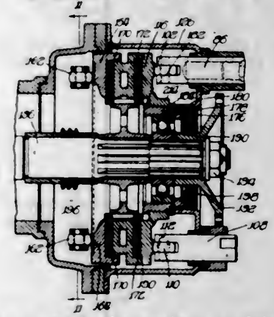
2. In a high pressure lubricating system, the combination of a source of lubricant under pressure, a three-way valve having one of the ports thereof connected to said source, the second port being connected to the atmosphere, a conduit capable of withstanding high lubricant pressures, connected to the third port of said valve, and having means for making a detachable connection with a part to be supplied with lubricant, a manually operated valve in the conduit whereby lubricant may be supplied to said part while it is connected with said conduit, and a member for supporting said conduit, said member being operatively connected with said valve to cause said valve to relieve the pressure on said conduit by connecting said conduit with the atmosphere when the conduit is supported by said member, and to connect said conduit to said source when the conduit is removed from said member.

2,097,872

COMBINED INSTRUMENT PANEL AND RADIO RECEIVER

Ray C. Ellis, Detroit, Mich., assignor to Radio Corporation of America, a corporation of Delaware

Application March 11, 1933, Serial No. 660,353
2 Claims. (Cl. 250—14)



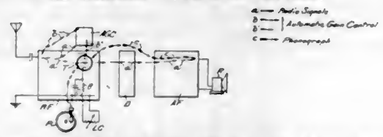
1. In combination with an instrument panel of a vehicle, radio apparatus comprising a radio receiver including a casing adapted to be mounted directly behind the panel through means arranged so as to permit removal of the receiver, a cable provided with a plug-in device adapted to cooperate with a plug receptacle in the receiver for connecting the radio receiver to a source of power so as to be energized thereby, a loudspeaker mounted on the receiver chassis and arranged directly in back of the instrument panel and a loudspeaker grille formed on the instrument panel and arranged so as to register with the loudspeaker, said panel forming a baffle plate for the loudspeaker.

2,097,873

REACTION TYPE POWER BRAKE UNIT

Edwin R. Evans, Kenilworth, Ill.

Application April 10, 1934, Serial No. 719,913
32 Claims. (Cl. 188—140)



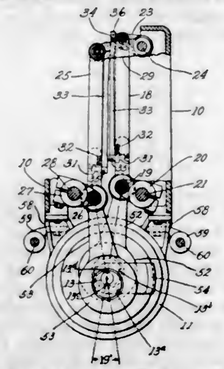
5. In a power brake system, a drive shaft, a friction member rotatable with said drive shaft but free to move axially with respect thereto, normally stationary input and output plates on opposite sides of said friction member, input means for developing an axial thrust against said input plate to frictionally grip said friction member between said plates and to produce rotation of said output plate, substantially axially extending output means movable by the rotation of said output plate to transmit the brake actuating force and to develop a brake reaction having a component acting in a direction parallel to the axis of said shaft upon said output plate in opposition to said input thrust.

2,097,874

RADIO RECEIVER

Paul O. Farnham, Boonton, N. J., assignor, by mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application May 18, 1933, Serial No. 671,772
18 Claims. (Cl. 179—100.11)



1. The method of increasing the audio amplification of a combined radio receiver-electrical sound reproducer system including a radio amplifier associated with an automatic gain control device arranged so as to maintain the amplifier output substantially constant, a detector and an audio amplifier which comprises converting a radio amplifier stage to an audio amplifier stage and at the same time rendering the automatic gain control inoperative when the system is to be employed for the electrical reproduction of sound, and transferring the amplified audio output of said converted stage directly to the audio amplifier.

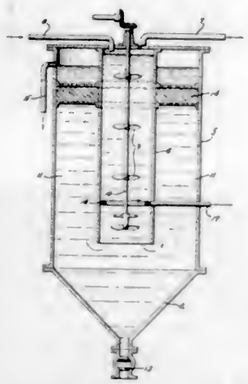
2,097,875

SLICING MACHINE CONSTRUCTION

Lester Ferenci, Brooklyn, N. Y., assignor to American Machine & Foundry Company, a corporation of New Jersey

Original application April 29, 1931, Serial No. 533,829. Divided and this application July 3, 1935, Serial No. 29,688
3 Claims. (Cl. 146—153)

2. A knife blade for bread slicing machines comprising a thin flat elongated body with a sharpened edge intermediate the ends thereof, and



having unsharpened end portions, cross pins rigidly fixed in said blade at the unsharpened end portions thereof, one of said pins being spaced a greater distance from the end of the blade than the other, said pins extending substantially at right angles to the plane of the blade on either side thereof for securing the same to spaced lugs at either side of the blade so as to prevent lateral pivoting thereof, said blade having a hole through the portion of the blade between the blade end and the pin which is at a greater distance from said blade-end for facilitating blade removal.

2,097,876

WATER SOFTENING METHOD

Charles T. Fuetterer, Akron, Ohio

Application August 10, 1933, Serial No. 684,535
5 Claims. (Cl. 210—16)

1. The method of conditioning water which comprises treating the water with lime in the presence of a small amount of a catalytic agent comprising a carbohydrate which is at least partially soluble in water in the presence of lime, the carbohydrate being present in an amount ranging from more than incidental impurities up to approximately 6% of the lime charge.

2,097,877

HAT FASTENING DEVICE

Samuel Getmansky, New York, N. Y.

Application July 23, 1937, Serial No. 155,165
10 Claims. (Cl. 24—143)

1. In a hat fastening elastic device, a pin element attached on one end of an elastic cord and comprising a sheet metal longitudinal strip having a point at one end, a tail portion at the other end, and a central tubular portion by which said pin element is attached on said elastic, and said central tubular portion having one side convexly curved longitudinally thereof and the other side also convexly curved longitudinally thereof but of a smaller curvature than the first mentioned side forming parallel ribs along the edges for reinforcing and stiffening said central tubular portion and for gripping said elastic cord.

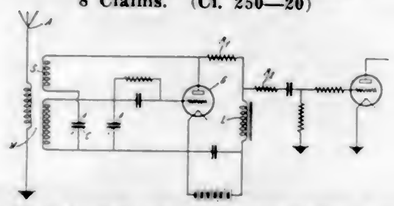
2,097,878

ANTIFRICTION BEARING AND METHOD OF MANUFACTURING THE SAME

Alf Gerhard Grabe, Stockholm, Sweden

No Drawing. Application January 28, 1935, Serial No. 3,811. In Sweden January 15, 1934
9 Claims. (Cl. 148—21)

1. The method of manufacturing a bearing which consists in making the bearing of a hypoeutectoid steel, heating the same to a temperature between ac_1 and ac_3, and then hardening the bearing in a suitable cooling medium.



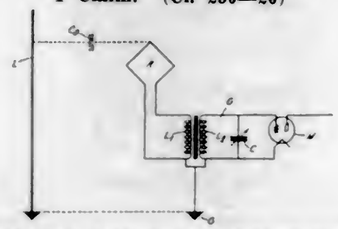
9. An anti-friction bearing assembly comprising a bearing of hypoeutectoid steel heated to a temperature between ac_1 and ac_3 and then hardened in a suitable cooling medium, and a steel journal.

2,097,879

RECEIVING ARRANGEMENT

Arthur Hammer, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application December 21, 1934, Serial No. 758,551
In Germany December 23, 1933
8 Claims. (Cl. 250—20)



1. A radio receiving circuit comprising a vacuum tube and associated input and output circuits, a feedback circuit including an adjustable reactance for controlling the selectivity of the input circuit, means for compensating for the loss in gain of high tonal frequencies caused by an increase in the selectivity upon increase of feedback, said compensating means comprising an inductance in the output circuit which forms with the adjustable feedback reactance an oscillation circuit resonating at a frequency which for slight feedback lies outside the transmitted audio frequency range and which with increase of feedback is shifted more and more into the transmission range.

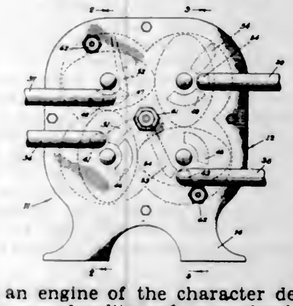
2,097,880

RADIO RECEIVING SYSTEM

Paul Hermanspann, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application February 12, 1934, Serial No. 710,812
In Germany February 14, 1933
1 Claim. (Cl. 250—20)

In signalling apparatus, a relay circuit provided with input terminals and output terminals,



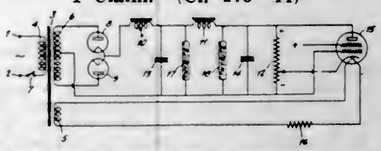
a tunable circuit connected across the input terminals, said tunable circuit comprising an inductance coil and a variable condenser, said latter being shunted across the coil, means connecting one end of the coil directly to ground, an untuned loop circuit including a loop and an inductance coil forming a closed circuit, inherent capacity between the loop circuit and a source of disturbing energy through which disturbances are transferred to the loop circuit, said second inductance coil having a low impedance value as compared to the impedance of said inherent capacity, means for closely coupling said two inductance coils including a core made up of powdered magnetic material.

2,097,881

ROTARY ENGINE

Milton S. Hopkins, Glendale, Calif.,

Application November 26, 1935, Serial No. 51,644
9 Claims. (Cl. 103—126)



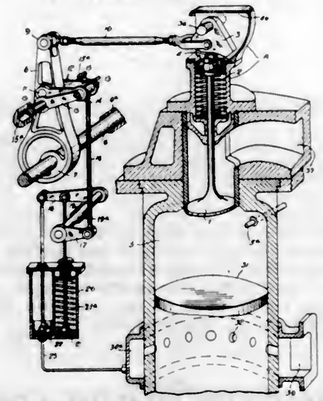
1. In an engine of the character described, a housing, a plurality of non-circular rotors mounted therein for simultaneous rotation all in the same direction about parallel axes, and contacting each other throughout their entire cycle of rotation whereby they and opposed walls of said housing cooperate to define a chamber whose volume varies as said rotors turn, the periphery of each of said rotors being defined by an arc at each end thereof having its center on the major axis of the rotor, and an arc defining each side of the rotor and connecting said end arcs, each side arc having its center on the line of the minor axis of the rotor beyond the axis of rotation thereof from said side arc, and means for conducting fluid to and from said chamber.

2,097,882

POWER SUPPLY CIRCUITS

William T. Hudtwalker, Richmond Hill, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Application June 9, 1933, Serial No. 675,062
1 Claim. (Cl. 178—44)



A filter circuit for use in connection with power supply systems utilized to energize thermionic tubes provided with indirectly heated cathodes and wherein an appreciable period of time is required for energizing the indirectly heated cathodes, said filter system including a choke and at least one filter condenser, an additional filter means shunted across the filter condenser comprising a device for protecting the filter condenser during the period of time required to energize the indirectly heated cathodes, said device comprising an element composed of a granular material having a hyperbolic resistance-ampere characteristic which is unaffected by variations in the rate of change of voltage applied to the element to produce a flow of current therethrough, the resistance of said element being always substantially the same for a given density of current flow through it whether the value of the said current density is attained by increasing or by decreasing the current flow, said additional filter means having a decreasing impedance with increasing applied potential across it whereby the additional filter means operates to smooth out current passing through the filter circuit.

2,097,883

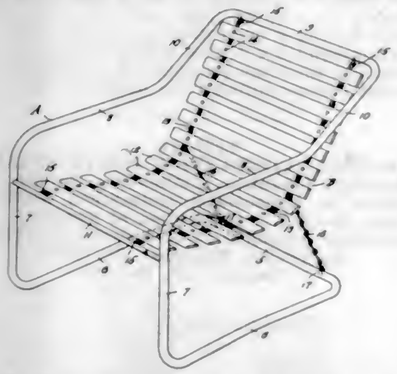
INTERNAL COMBUSTION POWER PLANT

Johan Erik Johansson, Gothenburg, Sweden, assignor to Aktiebolaget Götaverken, Gothenburg, Sweden, a corporation of Sweden

Application December 14, 1933, Serial No. 702,377
In Sweden December 15, 1932
7 Claims. (Cl. 60—44)

1. In a power plant, the combination with a reciprocating internal combustion engine having a cylinder in which charge forming air is compressed and which discharges combustion gases at substantial back pressure for further expansion in a prime mover, of air compressing means for supplying charging and scavenging air to said cylinder at pressure sufficiently high to cause a part of such air to be discharged at said back pressure with said combustion gases, and means responsive to a fluid pressure indicative of the final compression pressure in the engine cylinder for maintaining said final compression pressure substantially constant by varying the commencement of the period of compression in the cycle of operation of said engine.

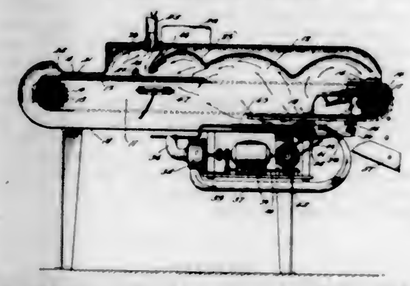
2,097,884



CHAIR OR ANALOGOUS ARTICLE OF FURNITURE

Emil A. Kann, Lawrence, N. Y.

Application June 29, 1935, Serial No. 29,045
2 Claims. (Cl. 155—54)

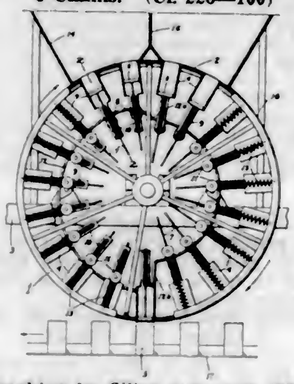


1. In a chair or similar article of furniture, a continuous resilient tubular supporting frame bent to provide a horizontally disposed base, upwardly extending legs constituting a continuation

of the forward ends of the side leads of the base, rearwardly directed arms constituting a continuation of the upper ends of the legs and an inverted U-shaped back rest support constituting a continuation of the rear ends of the arms, a transverse rung connecting the legs adjacent their upper ends, a seat and back rest forming member comprising spaced parallel transversely disposed slats and links flexibly connecting the slats together adjacent their ends, said links secured to the underside of and projecting beyond the side edges of the slats and bent to form eyes

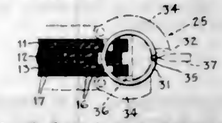
at their opposite ends interconnected with the eyes of the links of adjacent slats, and the opposite end links being flexibly anchored to the bight of the U-shaped back rest support and to the transverse rung, and a pair of flexible elements secured at their lower ends to the bight of the U-shaped base and to the links at the juncture of the seat and back rest portions of said member to hold the back rest portion thereof in a rearwardly inclined position and the seat portion thereof in a forwardly inclined position when the frame is in normal position or flexed by the weight of the occupant.

2,097,885
APPARATUS FOR IMPARTING A POLISH
Gustave E. Koppe, Providence, R. I.
Application April 16, 1932, Serial No. 605,720
3 Claims. (Cl. 91—55)



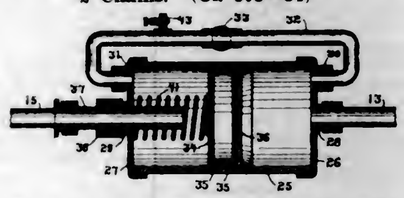
1. In combination, a casing having an inlet and an outlet, a conveyor mounted in said casing, a deflector mounted above said conveyor and dividing the upper portion of said casing into a treatment chamber and a drying chamber, means for passing chemical vapor into said treatment chamber, and means for passing heated air through said drying chamber.

2,097,886
PACKING FOR FRAGILE ARTICLES
Morris Koppelman, Brooklyn, N. Y.
Application December 22, 1934, Serial No. 758,745
3 Claims. (Cl. 217—26)



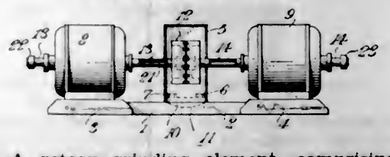
1. In a packing for eggs and other fragile articles, a sheet of fibrous material having article supporting and holding members thereon, the said members comprising round, upstanding, hollow article-fitting ridges with downwardly spreading sides having a cup-like depression in the interior to receive an end of an article, said round ridge being of a size and form to support the article out of contact with the bottom of said depression but in contact with the walls of said depression above its bottom, said ridge having therein grooves extending therethrough and crosswise thereof approximately to the bottom of said depression and being downwardly and inwardly inclined and tapered and extending to a point below the area of article contact, the said parts being constructed and arranged to direct air entering said grooves or liquid exuding from the article or gravitating on the surface thereof to the bottom of said depression and to permit air to pass through said holders from one side to the other beneath said article and to and from the exterior of said members.

2,097,887
CAN FILLING MACHINE
Wilbur E. Lacey, Oakland, Calif., assignor to George A. Dow
Application September 21, 1935, Serial No. 41,583
5 Claims. (Cl. 226—100)



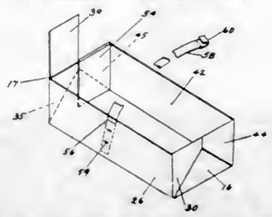
2. A machine for filling cans with different ingredients including, in combination, a container provided with a plunger constituting a movable bottom to the container and the contents of the container corresponding to the volume of the can to be filled, a succession of hoppers each containing an ingredient to go into the can, means whereby the container is made to traverse the discharge openings of the respective hoppers and successively to receive its pro rata of the respective hopper contents, and means for delivering the contents of the container directly into a can.

2,097,888
METHOD OF FORMING BOOKS
Frank J. Leyerle, Mechanicsville, N. Y.
Application April 13, 1935, Serial No. 16,122
1 Claim. (Cl. 11—1)



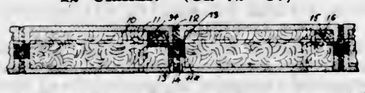
A method of forming a permanently bound book from a collection of sheets having aligned registering perforations along the edge to be bound, said method comprising forming the free ends of a staple-shaped binding wire into rings, passing said free ends through a pair of said perforations adjacent one side of said book as said free ends are being formed into rings, welding the extremities of said free ends to the connecting portion of said staple-shaped binding wire while they are being held in position by said forming means, and successively treating other staple-shaped binding wires in an identical manner until the binding is completed.

2,097,889
HYDRAULIC BRAKING SYSTEM
Floyd O. Miller, Akron, Ohio
Application December 20, 1935, Serial No. 55,377
2 Claims. (Cl. 303—84)



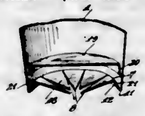
1. In a device of the character described, a cylindrical casing, a piston mounted therein, said casing having an inlet opening in one end thereof and provided with an outlet opening in the other end thereof, an outlet tube adjustably secured in said outlet opening and projecting into said casing to limit the movement of said piston, said piston adapted to close the bore of said tube when brought into operative contact therewith and means to operatively interpose said casing in a fluid pressure line.

2,097,890
ROTARY GRINDER
Elman B. Myers, Norristown, Pa., assignor of ten percent to Howard W. Dix, New York, N. Y.
Application September 6, 1928, Serial No. 304,337
2 Claims. (Cl. 83—8)



1. A rotary grinding element, comprising a hollow hub portion, an intermediate flexible support, and a rim portion secured to the support, and having a flat grinding surface lying in substantially the same plane as the support, the center of gravity of the rim mass and the grinding surface lying on opposite sides of the flexible support, whereby the grinding element is adapted, on rotation, to be flexed in the direction of the grinding surface, said flat grinding surface being provided with a plurality of peripheral depressions in the grinding surface adapted to serve as cutting members whereby to provide a shearing action of materials issuing from the grinding surface, a majority of said depressions being of substantially equal width from their beginnings in the grinding surface and continuing into the periphery of said rim portion, and having the depths of said depressions varying substantially on the arc of a circle, said depressions extending only part way through said rim.

2,097,891
BOX OR CARTON
Clifford J. Munce, London, Ontario, Canada
Application June 9, 1934, Serial No. 729,761
7 Claims. (Cl. 229—34)



2. A box of pliable material formed from a single blank and having sides and ends, a reinforce member for each of the sides, and a hand hold member and a combined locking member and end reinforce formed integral with each side.

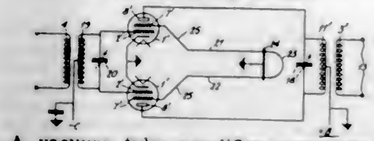
2,097,892
INSULATED TILE UNIT AND STRUCTURE
Edward R. Powell, Alexandria, Ind.
Application November 25, 1935, Serial No. 51,393
12 Claims. (Cl. 72—37)

1. A hollow tile building unit as an article of manufacture, including hard structural inner and outer shells with relative little web material connecting same, water repellent insulating material substantially filling the enclosed space between the shells, and means on the through webs to prevent capillary conduction of water therethrough.

2,097,893
CONTAINER
Samuel Reich, New York, N. Y.
Application November 22, 1935, Serial No. 51,049
3 Claims. (Cl. 229—5.5)

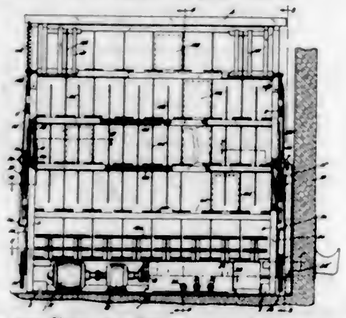
1. In a container, a body portion, the lower edge of the body being formed with an internal channel, tongues extending inwardly from the upper edge of the inner wall of the channel, said tongues being disposed in contiguous relation with one another to form a solid bottom for the container, and means co-acting with the channel to maintain the tongues in their contiguous relation and to reinforce the bottom.

2,097,894
BALANCING DEVICE FOR GRINDING OR POLISHING WHEELS
John Roche, Battle Creek, Mich.
Application September 26, 1935, Serial No. 42,294
8 Claims. (Cl. 51—169)



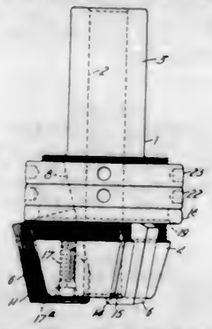
6. A balancing device for a grinding wheel, comprising a casting having an annular web provided with means for attaching the casting to the wheel and having a central aperture, a circumferential shouldered channel opening to one side of said casting, said casting having a plurality of uniformly disposed openings to the other side thereof, permitting insertion of weights in the channel and adapted to engage locking lugs on the wheel, a plurality of arcuate weights disposed in said channel and adjustable therein, and locking means threaded in said weights and bearing against said shoulders to lock the weights against movement in said channel.

2,097,895
MANUFACTURE OF ARTIFICIAL RESINS AND THE LIKE
Edmund Charles Rossiter, London, England, assignor, by mesne assignments, to American Cyanamid Company, a corporation of Maine
No Drawing. Application October 10, 1928, Serial No. 311,704. Renewed January 31, 1936. In Great Britain December 23, 1927
2 Claims. (Cl. 260—3)



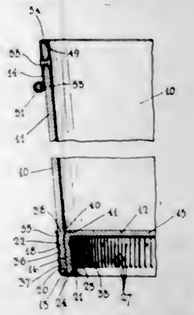
2. A resinous reaction product of formaldehyde, dicyandiamide, and an organic acid selected from a group consisting of oleic acid, stearic acid, linoleic acid, ricinoleic acid, butyric acid, camphoric acid, sulfanilic acid and naphthalene sulphonic acid.

2,097,896
AMPLIFYING ARRANGEMENT
Bernard Salzberg, New York, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application November 13, 1933, Serial No. 697,783
5 Claims. (Cl. 179—171)



1. A vacuum tube amplifier comprising the combination of a tube having at least a cathode, a control grid, a plate and a screen grid located between said control grid and plate, means for impressing voltage variations of high radio frequency on said control grid, a ground and a connection between said screen grid and ground comprising a transmission line having an electrical wave length of ½, where l is the wave length of the applied signal frequency.

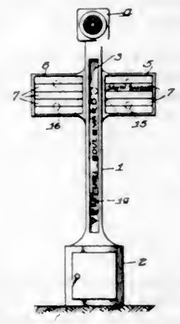
2,097,897
ICE VENDING MACHINE
John H. Schreiber, St. Louis, Mo.
Application November 5, 1932, Serial No. 641,335
21 Claims. (Cl. 312—35)



1. A vending machine comprising an article serving support adapted to receive a plurality of articles to be dispensed, means other than said support operable to individually discharge said articles from said support while said support remains unoperated, mechanism for moving said means in opposite directions from and to a starting position at each effective operation thereof, and means operated in timed relation with said first named means to reload said support when discharged.

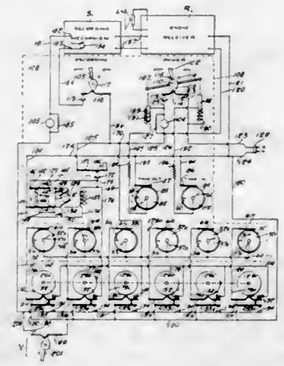
2,097,898
ADJUSTABLE HOLLOW MILL
Ole Severson, Shelton, Conn., assignor to The O. K. Tool Company, Inc., New York, N. Y., a corporation of New York
Application August 12, 1931, Serial No. 556,596
4 Claims. (Cl. 29—105)

1. A hollow mill cutting tool of the inserted blade type combining a hollow cylindrical body member provided with a plurality of radially arranged peripheral blade apertures at one end thereof, said apertures passing completely through the shell of the body at the forward end thereof, each of the apertures having side walls lying in parallel spaced planes and a bottom wall; cutter blade members having parallel side surfaces adapted to be fitted to said apertures with the forward portions thereof projecting into the hollow interior of the body and the bottom surfaces thereof in spaced relation to said bottom walls, each of said blade members having cutting edges provided across its forward end and around its inner corner; means adapted to move said blade members in a forward direction and simultaneously toward the axis of said body comprising a screw threaded element threaded to said body member and operatively engaging the rear portion of each of said blades; a plurality of interfitting parallel serrations formed on adjacent faces of each blade and blade apertures for guiding said blades in said direction of movement and simultaneously maintaining said blades in said spaced relation, said serrations being inclined forwardly and toward the tool axis and providing means for moving said blades laterally one or more serrations to effect major changes in tool diameter; and means individual to each blade for flexing entire end portions of said shell circumferentially against the blades thereby to clamp said blades in adjusted position.



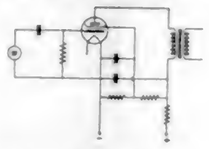
2,097,899
METHOD OF FORMING CONTAINERS
Swan Smith, White Bear, Minn., assignor to David C. Shepard, St. Paul, Minn.
Application December 5, 1935, Serial No. 53,022
8 Claims. (Cl. 93—39.1)

1. The method of forming the side wall structure of a conical container from a length of paper, which consists in cutting the paper transversely along curved lines to form separate sheets having the same degree of curvature at the top and bottom, and of a curvature such that the edges of the sheets at one end of the formed wall structure will register with one another, in securing the sheets together, in wrapped relation, one upon the other with the registrable edges in register, and in trimming the several sheets of the formed wall structure collectively at the other end of the said wall structure.



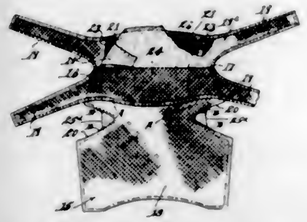
2,097,900
AUTOMATIC ROAD DIRECTION SIGN
Joseph B. Strauss, Chicago, Ill.
Application September 14, 1931, Serial No. 562,666
2 Claims. (Cl. 40—132)

1. A road direction sign comprising a hollow post, a frame projecting laterally therefrom on each side thereof, removable sign slats in said frames, and a light behind said sign slats, and a sign bearing portion extending vertically along said post intermediate said laterally projecting frames, and means for illuminating said vertically extending sign bearing portion and connections between said illuminated means and



said vertically extending sign bearing portion extending along the hollow of said post.

2,097,901
RADIO TUNING APPARATUS
Adolph A. Thomas, New York, N. Y., assignor to Radio Corporation of America, New York, N. Y., a corporation of Delaware
Application April 28, 1932, Serial No. 607,917
7 Claims. (Cl. 250—20)

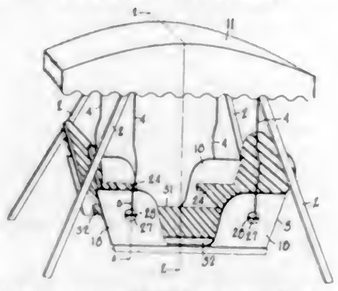


6. A clock-controlled tuning mechanism for radio receivers, comprising in combination a plurality of dials representing each a certain station, a pair of rotary electric contacts associated with each dial, one contact of each pair being manually adjustable and the other contact being operated by clock-work, a single clock-driven shaft for simultaneously operating all of said other contacts, whereby the manual adjustment of the first-named contact of any dial determines the time at which said contact engages the associated clock-driven contact, means whereby the engagement of a pair of said contacts automatically tunes in the station represented by the corresponding dial, a pair of additional dials carried by said mechanism and having each a manually adjustable pointer to indicate the time, contact means associated with said additional dials for causing the connected radio receiver to be automatically turned on and off at the respective times indicated by the pointers of said additional dials.

2,097,902
DETECTOR CIRCUIT
Rudolf Urtel, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application June 1, 1933, Serial No. 673,877
In Germany June 2, 1932
4 Claims. (Cl. 250—27)

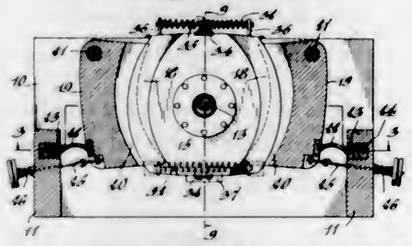
1. In the operation of a screen-grid tube grid circuit detector, the method of maintaining the steady component of the plate current flow substantially uniform despite variations in the strength of carrier energy applied to the input of the detector which comprises utilizing the variations in steady component of the plate current due to variations in the strength of the carrier energy to proportionately and in an opposite sense vary the screen grid voltage.

2,097,903
DIAPER
Clarissia Wallis, Chicago, Ill.
Application December 26, 1935, Serial No. 56,153
2 Claims. (Cl. 128—284)



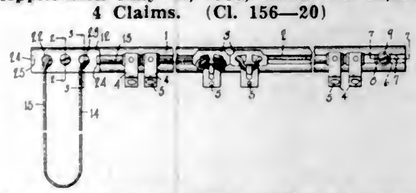
2. A diaper as described, comprising inner and outer absorbent layers, said layers having leg cut-out portions at the side thereof, and means to prevent the outer layer from becoming moist upon the moistening of the inner layer, said means including a non-absorbent element between said layers, the side edges of said element being adapted to extend outside of and partially across the said leg cut-outs and adapted to adhere to the body of the wearer upon becoming moist.

2,097,904
PRODUCTION OF MALEIC ACID
Clyde H. Walters, South Charleston, W. Va., assignor, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York
No Drawing. Application April 9, 1935, Serial No. 15,398
10 Claims. (Cl. 260—116)



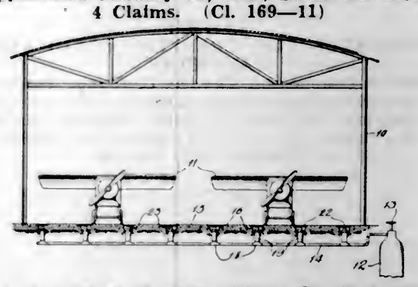
1. The process for preparing maleic acid which comprises contacting the vapors of a free oxygen-containing gas in excess of that necessary for complete combustion and a member of the group consisting of butylene, butadiene, and substances from which butylenes are readily generated, with an oxidation catalyst containing as essential constituents tin vanadate, molybdenum oxide and titanium oxide, at a temperature of about 250° C. to about 400° C., and recovering the maleic acid from the reaction product.

2,097,905
SWING
Earl L. Weaver, Goshen, Ind., assignor to The Goshen Manufacturing Company, Goshen, Ind.
Application October 26, 1934, Serial No. 750,039
6 Claims. (Cl. 155—62)



3. A swing comprising a horizontal frame having outwardly and downwardly inclined corner posts provided with alined transverse bores, bearings fitting within said bores, a gondola having opposed side panels provided with transverse holes, seats having side rails disposed adjacent the inner sides of said panels and provided with downwardly opening slots in line with said holes, inner and outer plates bolted together through said side rails and side panels and having bearing holes therein, and hanger rods having outturned upper ends extending through said bearings for supporting the hangers, and inturned lower portions extending through the bearing holes in said side plates for supporting the gondola, and nuts threaded to the ends of said hanger rods.

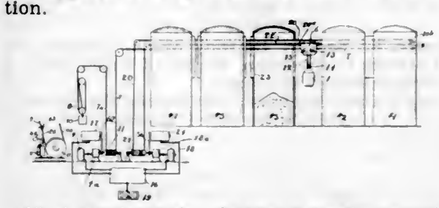
2,097,906
CRUSHER FOR STONE AND LIKE MATERIALS
William L. Wettlaufer, Buffalo, N. Y., assignor to The W. S. Tyler Company, Cleveland, Ohio, a corporation of Ohio
Application September 8, 1933, Serial No. 688,598
3 Claims. (Cl. 83—10)



1. In a crusher, a movable crusher body provided with horizontally opposed crusher faces, normally stationary jaws supported in a frame on opposite sides of said body and forming therewith two downwardly convergent throats, an eccentric shaft extending through said body at substantially its center of gravity for gyrating the same with respect to said jaws, and coil spring means above and below said crusher body and between it and said frame constantly urging said body to a neutral position between said jaws.

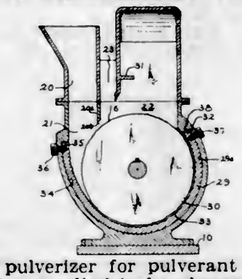
2,097,907
TRAVERSE CURTAIN ROD
Archie A. Allen, Sturgis, Mich., assignor to Kirsch Company, Sturgis, Mich.
Application May 22, 1936, Serial No. 81,238
4 Claims. (Cl. 156—20)

3. A cord separator and guide for a traverse curtain rod construction in which a rod of substantially C-shaped cross section is employed as a track and to conceal the traverse cord, comprising an inside plate to be disposed within the rod and of a width greater than the width of the slot in the rod and having a pair of apertures therein for the passage of the traverse cord, an outside plate of greater width than the slot in the rod and having a pair of apertures in register with the apertures in the inside plate, and means for clamping said plates together, whereby said cord separator and guide is held in position at the slot in said rod by clamping the rod at the edge of the slot between said plates.



2,097,908
FIRE EXTINGUISHING SYSTEM
Scott E. Allen, Glen Ridge, N. J., assignor to C-O-Two Fire Equipment Company, Newark, N. J., a corporation of Delaware
Application January 10, 1936, Serial No. 58,446
4 Claims. (Cl. 169—11)

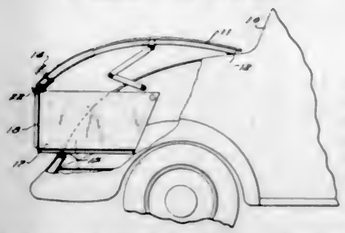
1. A method of extinguishing fire in a space having a floor which consists in discharging below the floor level jets of fire extinguishing fluid liquefied under pressure, expanding the liquid into a gas, discharging the expanding gas through the floor, and with other jets of the extinguishing fluid discharging above the floor level spreading the expanding gas horizontally along the floor whence the expanded fluid may be drawn into the fire by suction produced by the fire.



2,097,909
CONVEYER CONTROL SYSTEM
Frederick W. Atz, Jr., Philadelphia, Pa., assignor to Link-Belt Company, Chicago, Ill., a corporation of Illinois
Application June 21, 1930, Serial No. 462,804
Renewed September 20, 1937
22 Claims. (Cl. 212—126)

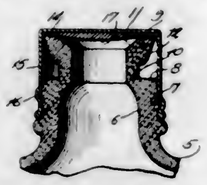
1. A conveyer system comprising loading and unloading stations, a control station, a carriage, an electric motor at said control station for moving said carriage between loading and unloading stations, a material-supporting structure adapted to be transported by said carriage, a second electric motor at said control station for hoisting and lowering said structure toward and away from said carriage, means responsive to movement of said structure to loading position for effecting flow of material to be transported into the interior thereof, relays located at said control station for controlling the energization and direction of rotation of said motors, switch structure driven by said motors for controlling relays automatically to effect lowering and hoisting of said structure at said stations and travel of said carriage between said stations, and a slack-cable switch actuated when said structure engages at the unloading point material previously transported thereto for controlling said relays to effect reversal of said second motor to hoist said structure, all elements of the electro-mechanical control apparatus being located at said control station.

18. A carrier system having a carrier mounted on a trolley and arranged to be operated in a predetermined cycle from a loading station to and from an unloading station, a hoisting motor for raising and lowering said carrier, a trolley motor for driving said carrier between said stations, electromagnetically operated switches for establishing motor circuits to operate said motors in either direction, means for locking said electromagnetically operated switches in given positions and suited to maintain them in said positions in event of power failure, limit switches responsive to the movements of said carrier, and electrical means responsive to the operation of said limit switches for releasing said locking means.



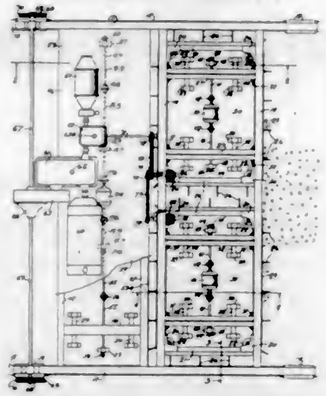
2,097,910
PULVERIZER
Harry H. Bates, Ridley Park, Pa.
Substitute for abandoned application Serial No. 689,513, September 15, 1933. This application March 14, 1935, Serial No. 11,179
6 Claims. (Cl. 83—14)

1. In a pulverizer for pulverant materials, a wheel having a cylindrical and granular peripheral abrading surface; a member having an internal arcuate and granular abrading surface closely spaced with respect to the wheel surface; side plates fitting closely with respect to the wheel and the member and cooperating with said surfaces to define an arcuate pulverizing passage; means for supplying material to be ground



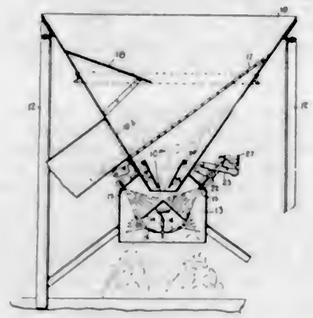
to the inlet end of said passage; material being ground and moved along the passage due to movement of the wheel; a separation chamber at the discharge end of said passage and transversely of which material discharged from the passage is thrown by the wheel surface, the bottom of said separation chamber being constituted by the wheel surface; means providing for a current of air entering the separation chamber between the wheel surface and the tangential stream of discharging material and flowing across the latter to effect separation of lighter from heavier particles and to carry away the lighter particles in suspension, the heavier particles dropping onto the wheel surface; and means utilizing the wheel surface to convey heavier particles from the separation chamber to the inlet end of said passage.

2,097,911
VEHICLE BODY
George F. Becker, Detroit, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Application August 8, 1936, Serial No. 94,908
5 Claims. (Cl. 296—26)



1. In a vehicle body including a storage compartment having a closure member therefor and a supplemental carrier for said compartment; mechanism for latching said closure member to said carrier comprising a latch engageable element carried by said carrier and a cooperating latching element carried by said closure member, said first named element receiving and supporting an end portion of said closure member.

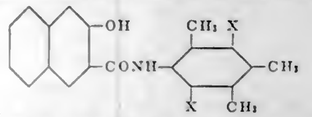
2,097,912
BOTTLE NECK CONSTRUCTION
Stanley Ward Burnham, Elizabeth, N. J., assignor to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey
Application June 8, 1934, Serial No. 729,686
2 Claims. (Cl. 215—31)



1. A bottle-neck construction having a pouring lip co-extensive with the entire circumference of the bottle neck formed by an upwardly and outwardly inclined inner face and a downwardly and inwardly inclined outer face, and a well defined horizontally-spaced pouring ledge between the upper ends of said faces and forming an acute angular dropping edge with said outer face.

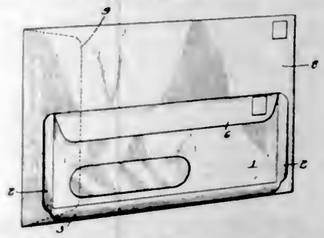
2,097,913
APPARATUS FOR LAYING PAVEMENT
Dell G. Clifford, Chicago, Ill.
Application March 18, 1933, Serial No. 661,490
22 Claims. (Cl. 94—44)

1. A pavement laying machine embodying means for advancing the machine to a pile of material exterior of the machine, means for removing the material from such pile and directly distributing the same substantially uniformly over the surface upon which it is to be laid and while the material is maintained upon such surface, and vibrating means operating upon the material as it is laid.



2,097,914
APPARATUS FOR TREATING SOLID FUEL PARTICLES
Edward Cooper and Thomas C. Shiels, Toronto, Ontario, Canada, assignors to Elias Rogers Company Limited, Toronto, Ontario, Canada
Application May 1, 1937, Serial No. 140,087
6 Claims. (Cl. 91—44)

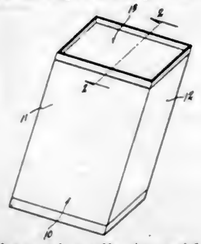
1. Apparatus for treating solid fuel comprising a hopper adapted to hold fuel particles having a discharge opening in its lower end; spray nozzles below the discharge opening of the hopper; a feed pipe for feeding liquid under pressure to the nozzles; a valve in the feed pipe; pivoted fingers adjacent the lower end of the hopper, said fingers tending to rise but adapted to be depressed by the weight of fuel in the hopper; and connecting members between the fingers and the valve whereby when the fingers are depressed the valve is opened.



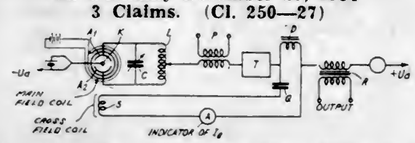
2,097,915
ICE COLOR INTERMEDIATES
Miles Augustinus Dahlen, Wilmington, Del., and Martin Edwin Friedrich, Carneys Point, N. J., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 17, 1935, Serial No. 54,850
4 Claims. (Cl. 260—124)

1. A compound represented by the formula:

in which X is one of the group consisting of hydrogen, halogen, and methyl.



2,097,916
ENVELOPE
Charles F. Elmore, Evanston, Ill., assignor of one-half to Bernard W. Boman, Oak Park, Ill.
Application May 8, 1936, Serial No. 78,630
6 Claims. (Cl. 229—72)

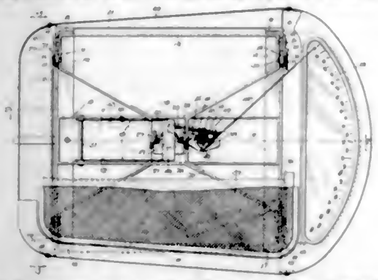


1. Means for forming a letter compartment on the outer surface of a relatively large envelope, or on the surface of a box or package or other container, comprising a single sheet of paper formed with integral gummed edge portions of single thickness for pasting upon the outer surface of said envelope or other container, having an entrance slot in an integral portion near one edge thereof, so that said slot is entirely external of and precludes entrance therethrough to the interior of said envelope or other container, and having said one edge provided with an integral flap for closing said entrance, whereby said sheet forms the outer wall of the letter compartment, while an imperforate outer wall of the envelope or other container forms the inner wall of said letter compartment, but with only single thickness edges for said letter compartment upon the outer surface of the envelope or other container.

2,097,917
METALLIC END CLOSURE FOR PAPER CARTONS
Joseph M. Frederick, Baltimore, Md., assignor of one-half to Jacob L. Rosenfield, Baltimore, Md.
Application August 14, 1936, Serial No. 96,065
4 Claims. (Cl. 229—43)

3. A receptacle of paper or other fibrous material having a plurality of sides and at least one open end, a metallic closure for said end comprising a unitary sheet metal stamping formed to provide a flat body portion and a substantially vertical channel at each side thereof each channel being adapted to receive therein the entire edge portion of a corresponding side wall of said receptacle, the transverse edges of adjacent channels being mitered and in juxtaposed relation so that in the fastening of the closure to the receptacle by the forced clamping of the channel walls to said edge portions of the receptacle side walls the mitered end edges of said channels are forced into abutting engagement to define solid corners completely covering the corners of said receptacle.

2,097,918
MAGNETRON DETECTOR
Karl Fritz, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application December 23, 1935, Serial No. 55,726
In Germany December 20, 1934
3 Claims. (Cl. 250—27)



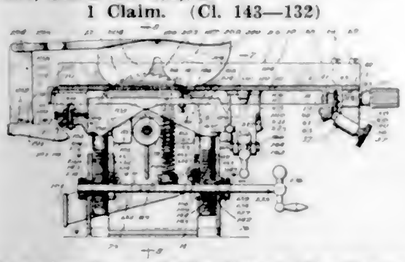
1. In a detector circuit for radio reception, an electron discharge tube of the magnetron type having a cathode and cylindrically formed anode segments symmetrically disposed about said cathode, a source of potential applied in circuit between the cathode and anodes and of such value that an unsaturated condition of space charge is produced, said anodes being disposed at a minimum operating radius about said cathode thereby to minimize the value of anode potential required for damping reduction, and a magnetic field producing device for directing the electron stream in said tube, said device having a coil coupled to the anode-cathode circuit.

2,097,919
SCALE
Max Garbell, Chicago, Ill., assignor to Victor Adding Machine Company, Chicago, Ill., a corporation of Delaware
Application June 3, 1935, Serial No. 24,608
4 Claims. (Cl. 265—68)

1. A scale having a base and a depressible platform carried in spaced relation therewith, platform supporting means comprising a pair of opposed members, said platform supporting means being pivotally carried on the base and having its opposed ends operatively connected together centrally of the platform, a coiled spring interposed between the base and said operative connections of the platform supporting means resisting the depressing movement of the platform, indicating means for registering the weight placed on the platform, said indicating means having operative connections extending adjacent the operative connection of the platform supporting means, and a follower having one end

thereof pivotally carried on the base and with its other end adapted to overlie and engage the operative connection of the platform supporting means and indicating means, said fol-

lower forming means to depress the operative connection of the indicator to move said indicator when a load placed on the platform depresses the platform supporting means.



2,097,920

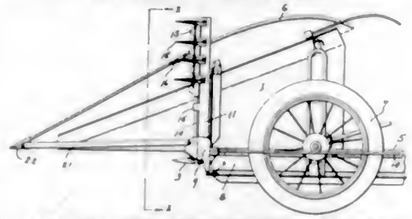
BENCH SAW TABLE

Theron L. Hedgpeth, Oak Park, Ill., assignor to Duro Metal Products Company, Chicago, Ill., a corporation of Illinois

Original application May 27, 1935, Serial No. 23,541. Patent No. 2,075,282, dated March 30, 1937. Divided and this application March 29, 1937, Serial No. 133,542

1 Claim. (Cl. 143—132)

In a bench saw table, the combination of a bench saw table provided on its lower surface with a pair of substantially cylindrical sockets, with a pair of elevator shafts, one of said shafts being mounted in each of said sockets and fixedly secured therein, said shafts having a series of slots cut in one side forming gear teeth, a metal base comprising a cast metal member of substantially rectangular shape in plan, said base being provided with a pair of upwardly extending walls provided with horizontally extending bearing sockets, a saw blade rotatably mounted in bearings carried by said sockets and projecting through a slot in said table, said base being provided with a pair of vertically extending cylindrical bores for receiving said shafts, and said cylindrical bores communicating with transverse bores located in the side walls of said base, a drive shaft in said transverse bores, said drive shaft having a crank and being provided with combined thrust bearings and pinions, said combined thrust bearings and pinions being oppositely situated and having their thrust-bearing portions engaging the outer walls of said base, with the pinions projecting in said transverse bores and having their teeth in engagement with teeth of said shafts, said base being provided with a socket, and said table being provided with a downwardly projecting pin and a compression coil spring mounted in said socket about said pin for supporting a portion of the weight of said table, whereby the table may be elevated or lowered by means of said crank with respect to the saw blade.



2,097,921

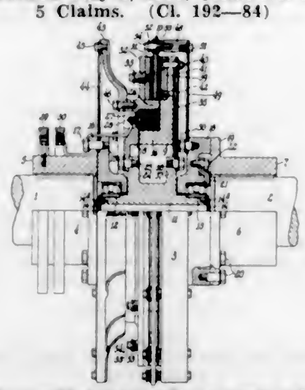
TANGLE CUTTER FOR REAPERS AND SIMILAR AGRICULTURAL IMPLEMENTS

Ferdinand M. Hite, Sherwood, Oreg.

Application July 20, 1936, Serial No. 91,530

4 Claims. (Cl. 56—316)

1. A tangle cutter for agricultural implements employed for cutting crops and provided with a reciprocating sickle for that purpose, comprising a support member mounted to the implement beneath the divider board thereof, braces pivotally connected between the forward end of the divider board and the member for folding such board, a sickle support mounted vertically upon such support and extending adjacent the outer side of the divider board and projecting thereabove, a sickle reciprocatably mounted within the sickle support, a bell crank journaled in the support member, a link connected between the sickle of the implement and one arm of the bell crank, and a link connected between the other arm of the bell crank and the second sickle.



2,097,922

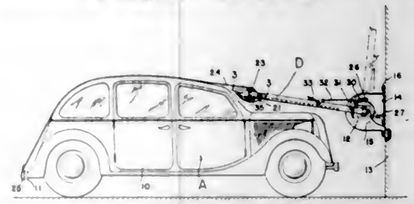
ELECTROMAGNETIC CLUTCH

Howard E. Hodgson, Wauwatosa, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis., a corporation of Delaware

Application July 6, 1936, Serial No. 89,092

5 Claims. (Cl. 192—84)

1. The combination with a pair of axially spaced shafts, of a member supported at opposite ends by said shafts and permitting misalignment of said shafts and also relative rotation thereof, and an electromagnetic clutch having cooperating driving and driven elements, said driving element being carried by said member, and having a flexible driving connection between the same and one of said shafts and said driven element having a flexible driving connection between the same and the other of said shafts and being supported by said latter shaft.



2,097,923

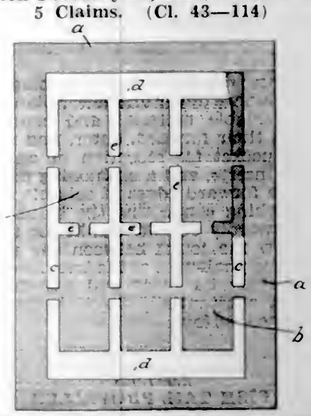
CAR PROTECTOR

Charles W. Hutchinson, Milwaukee, Wis.

Application March 23, 1936, Serial No. 70,359

3 Claims. (Cl. 135—5)

1. A collapsible shelter for automobiles comprising a swinging frame movable toward and away from the hood of an automobile, a canvas apron carried by said frame for the hood, releasable means for holding the frame in an adjusted position, a roller carried by the outer end of the frame, and a canvas covering normally wound on said roller adapted to be moved over the top of an automobile.



2,097,924

FLY PAPER

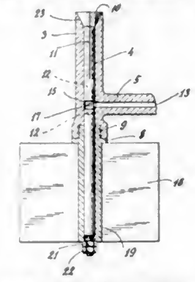
William S. Kell, Upper Darby, Pa.

Application February 25, 1937, Serial No. 127,634

5 Claims. (Cl. 43—114)

1. A sheet of fly paper the major part of the surface of which is comparatively smooth and of a color for which the fly exhibits a preference, a minor part of the surface of which is comparatively rough, the interior part of the colored surface adjacent the roughened surface being covered with a sticky substance, the marginal portion of the colored surface being free of said sticky substance.

2,097,925



MEANS FOR AUTOMATIC FUEL MIXTURE ADJUSTMENT ACCORDING TO TEMPERATURES

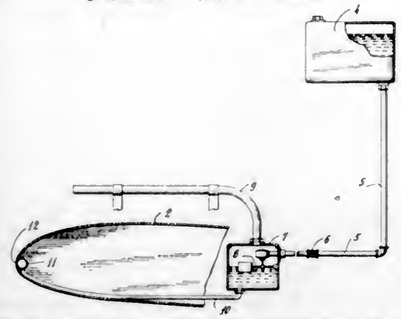
Leo B. Kimball, New Haven, Conn., assignor to Fuel Development Corporation, a corporation of Delaware

Application August 15, 1936, Serial No. 96,191

4 Claims. (Cl. 261—39)

1. An automatic air-fuel mixture regulating device for internal combustion engines, comprising, a carburetor, a tube therein for introducing fuel, said tube containing a member having an outlet orifice that is capable of variable size, means for supplying fuel to said orifice, and a device

operated by changes in the temperature of the surrounding atmosphere to vary the effective area of said orifice.



2,097,926

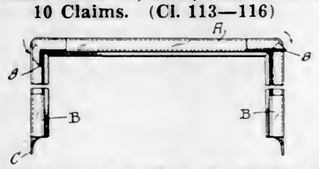
DEICING APPARATUS FOR AIRPLANES

Leo B. Kimball, New Haven, Conn., assignor to Fuel Development Corporation, a corporation of Delaware

Application June 9, 1937, Serial No. 147,198

5 Claims. (Cl. 244—134)

2. In deicing apparatus for airplanes, the improvements that comprise, internal means for distributing a deicing liquid over the surface to be deiced, a chamber having a substantially constant level of deicing liquid therein, a pipe leading from said chamber to said distributing means, a device for producing an hydrostatic pressure on said liquid in said chamber and in said pipe, and means to counterbalance said pressure when said distributing means is not obstructed by ice.



2,097,927

METHOD OF MAKING BAG FRAMES AND BLANKS THEREFOR

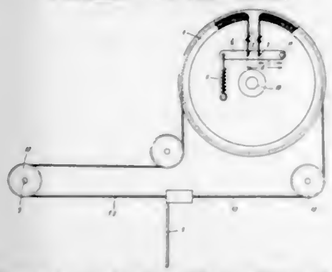
William J. Klemp, Maplewood, N. J., assignor to Karl Oswald, Newark, N. J.

Application June 26, 1936, Serial No. 87,420

10 Claims. (Cl. 113—116)

1. The steps in a method of forming a metal frame, consisting in forming a strip of metal into channel shape with a slit transversely of the base

and side walls of the channel in a plane inclined to said base and terminating short of the free edges of said side walls, and bending the channel at said slit and forcing the ends of the base and side walls at one side of said slit into the channel at the other side of the slit.



10. A blank for a frame section comprising a strip of bendable sheet material having a V-shaped mitering notch in one longitudinal edge and a U-shaped slit extending transversely of said strip with one arm terminating short of the base of said notch and with its extremity in alinement transversely of the strip with the base of the notch.

2,097,928

CORD TENSIONING DEVICE FOR TUNING MEANS

Erwin König, Berlin-Neukolln, Germany, assignor to Allgemeine Elektricitats Gesellschaft Friedrick Karl, Berlin, Germany, a corporation of Germany

Application January 30, 1936, Serial No. 61,549
In Germany March 25, 1935
3 Claims. (Cl. 116—124.1)

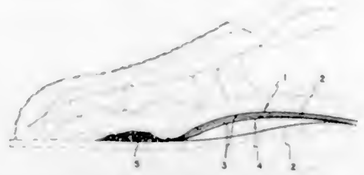
1. Means for indicating the position of an adjustable radio device comprising the combination of a pulley connected to said device, a pointer, cords extending in opposite directions over the periphery of said pulley to said pointer, a lever pivotally connected to said pulley and having spaced apart points to which the ends of said cords are secured, and means moving said lever in a direction to tension said cords.

2,097,929

PLANT BALL PACKAGE AND METHOD OF MAKING THE SAME

John Thompson Lovett, Jr., Little Silver, N. J.

Application February 27, 1936, Serial No. 65,937
5 Claims. (Cl. 47—37)



2. A plant ball package including a plant ball, a casing formed about the same, said casing consisting of a waterproof multiply sheet material that is creped longitudinally of the plant ball to facilitate the forming of the casing, securing cords tensioned around the casing, said casing being secured at the lower end thereof to the plant ball, and at its upper end substantially directly about the plant stem, and a restraining band of a flat sheet material wound around said casing intermediate of the ends thereof, said band being continuously adhesively joined to the casing, said band providing a relatively smooth outer surface of substantial area adapted to receive indicia respecting the plant ball.

2,097,930

FOOT APPLIANCE

Rudolf Lustig, deceased, late of Milwaukee, Wis., by Emily Lustig, administratrix, Milwaukee, Wis., assignor to Adam J. Deneseus, Milwaukee, Wis.

Application August 6, 1936, Serial No. 94,656
1 Claim. (Cl. 36—71)

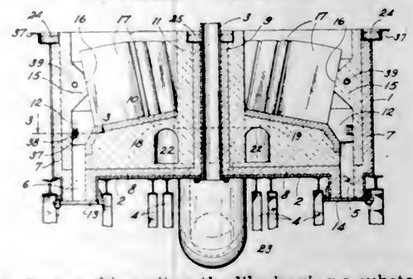
A corrective shoe insert comprising an arch support including upper and lower blanks formed of thin yieldable material and connected by stitching at their forward, outer, and rear edges to form a pocket for reception of one or more cushioning inserts, and a cushioning pad secured between the forward edges of said blanks by the line of stitching connecting the blanks and extending forwardly of said blanks for supporting a foot below the joints between the metatarsal bones and the phalanges of the toes, said cushioning pad having its front and attaching edges skived to a substantially feather edge forming a top crowned surface.

2,097,931

FISH TAIL PROPELLER

Harry Clayton Martin, St. Petersburg, Fla.

Application January 15, 1937, Serial No. 120,812
17 Claims. (Cl. 115—30)



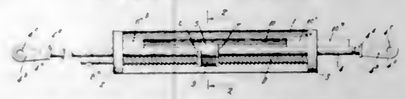
1. In a fish-tail propeller, a support, means to mount said support over the end of a boat, a beam pivotally mounted in said support on a vertical axis, one end of said beam extending into the boat and the other end extending to the rear of the boat and carrying a vertical sleeve, a propeller blade having a shaft pivotally journalled in said sleeve, a lever journalled on an axis coincident with that of said propeller's shaft, resilient means connecting said lever with said propeller blade's shaft and continuously tending to maintain the propeller blade in line with said beam.

2,097,932

SOAKING PIT

Willis McKee, Cleveland, Ohio, assignor to Central National Bank of Cleveland

Application March 20, 1937, Serial No. 132,106
10 Claims. (Cl. 263—9)



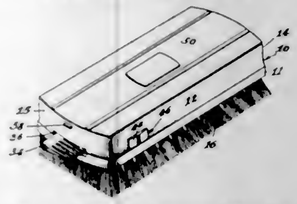
1. In a soaking pit or the like having a substantially circular heating chamber, a central pilaster, a top for said heating chamber having a bearing on said pilaster and rotatable thereabout, said top having a hatchway opening into the heating chamber, a cover for said hatchway, means for rotating said top about said pilaster, and means for moving said cover to open and close said hatchway.

2,097,933

SYNCHRONIZING APPARATUS

Glen E. McPherren, San Diego, Calif., assignor of one-half to Philip Taber, San Diego, Calif.

Application February 20, 1937, Serial No. 126,788
7 Claims. (Cl. 74—395)



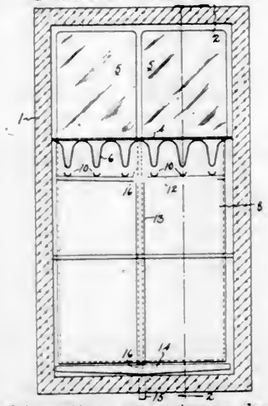
1. In a synchronizing apparatus, a pair of spaced journal members, a shift rod, shiftably mounted longitudinally in said journal members, a long gear member positioned parallel with said shift rod journaled in said journal members and having a shaft extending from one end thereof, a screw member parallel with said long gear member journaled in said journal members with an extended shaft extending in the opposite direction from the extended shaft of said gear member, a short gear screw threaded on said screw member and meshing with the other gear member, and means connecting said short gear member with said shift rod.

2,097,934

TOILET ARTICLE

Simon Morrison, New York, N. Y.

Application November 18, 1935, Serial No. 50,321
2 Claims. (Cl. 132—87)



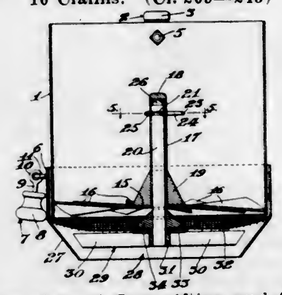
1. A device of the character described comprising a casing made up of a bottom, a thin metallic shell forming side and end walls and a tray fixedly secured within said side walls above said bottom, said tray being formed to provide article receiving compartments, and means associated with the walls of said compartments for retaining articles therein.

2,097,935

REFRIGERATOR

Clara E. Quinn, Mount Vernon, Ill., assignor to Broquinda, Inc., Wilmington, Del., a corporation of Delaware

Application March 21, 1936, Serial No. 70,050
4 Claims. (Cl. 62—89)



1. A refrigerating apparatus as described comprising a heat insulated cabinet, a metal shelf forming a partition dividing the cabinet into two chambers, a corrugated wall secured to the under surface of said shelf forming a container composed of a plurality of channel-shaped compartments, said wall and shelf being joined to close said compartments at one end, and at the other end connecting with a metal fin-shaped casing, said compartments communicating with each other through said casing, said casing extending below said shelf and forming with the container a closed circulating system for a secondary refrigerant.

2,097,936

DEVICE FOR SIFTING AND FLUFFING FLOUR

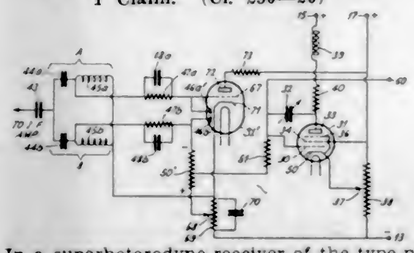
Junius D. Roberson, Cleburne, Tex.

Substituted for abandoned application Serial No. 756,865, December 10, 1934. This application May 3, 1937, Serial No. 140,458
10 Claims. (Cl. 209—245)

1. A two element flour sifting and fluffing device, one element comprising a swingably suspended upper flour receiving container having a

generally solid flour-supporting bottom provided with restricted openings whereby to normally support the contained flour in a naturally self-packed quantity, the other element comprising a lower sifter container movably supported on said upper container and having a sifting screen in receiving relation beneath the restricted openings of the flour-supporting bottom of said upper container, stop means for limiting relative reciprocal movement between said upper and lower containers, and means for forcibly reciprocating said lower container on its support on said upper container, with impact of said stop means at the end of each stroke in either direction, whereby flour is dislodged from the flour supporting bottom of said upper container and delivered in limited quantity into said lower container and by the same impacting effect the deposited flour is sifted through the sifting screen of said lower container without accumulation on the screen.

2,097,937



HIGH FREQUENCY OSCILLATING CIRCUIT

Noël Meyer Rust, Chelmsford, Essex, England, assignor to Radio Corporation of America, a corporation of Delaware

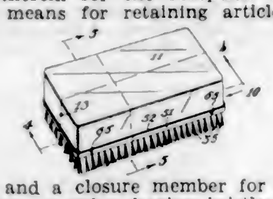
Application October 8, 1935, Serial No. 44,045

In Great Britain September 14, 1934

1 Claim. (Cl. 250—20)

In a superheterodyne receiver of the type provided with an intermediate frequency energy circuit and a tunable local oscillator circuit whose frequency is to be automatically controlled, the improvement which consists of a network comprising a pair of resonant circuits, each resonant circuit including a rectifier, means for impressing the intermediate frequency energy upon said resonant circuits, one of the resonant circuits being tuned to a frequency differing from the intermediate frequency by a predetermined frequency value, the other resonant circuit being tuned to a frequency differing from the intermediate frequency by the same frequency value but in an opposite direction, an electron discharge tube, means, responsive to the current flow in one of said rectifier circuits, for varying the space current flow of said tube, an impedance in the space current circuit of said tube, and tube means connected to said impedance and the second of said rectifier circuits, and whose gain is responsive to direct current voltage developed across said impedance by the space current flow therethrough and the current flow in said second rectifier circuit, for providing a reactance of variable magnitude.

2,097,938



TOILET ARTICLE

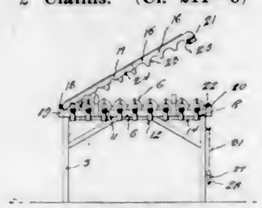
Theodore Sundin, New York, N. Y., assignor to Metalfield Incorporated, Long Island City, N. Y., a corporation of New York

Application July 25, 1936, Serial No. 92,496

5 Claims. (Cl. 132—87)

1. A device of the character described comprising a generally rectangular shell, a liner therefor of molded material, said liner having pockets molded therein for the reception of articles, resilient means for retaining articles in said

pockets, and a closure member for said shell, said closure member having bristles extending from one surface thereof.



2,097,939

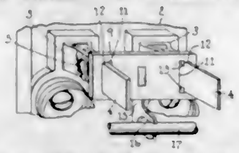
MACHINE GUN RACK

William H. Timm, Appleton, Wis.

Application May 29, 1936, Serial No. 82,529

2 Claims. (Cl. 211—8)

1. A machine gun rack comprising a supporting base, a top frame rigidly connected to said base including front and rear bars having their upper edges provided with transversely alined notches for receiving parts of the machine guns, the notches conforming to the configuration of the parts of the guns engaged, a swinging frame including front and rear bars arranged directly above the front and rear bars of the top frame and having their lower edges provided with companion notches for the notches in the top frame and for engaging over parts of the machine guns, means hingedly connecting the swinging frame at one end to one end of the top frame, the opposite end of the top frame being provided with pairs of upstanding apertured ears for receiving a part of the swinging frame therebetween, said parts of the swinging frame received between said ears having openings therein, pins detachably fitted in the openings in the ears and swinging frame, and padlocks for preventing the unauthorized removal of the pins from the ears.



2,097,940

SWITCH

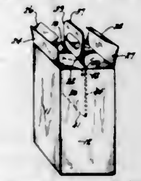
Felix J. Watts, Minerva, Ohio, assignor to American Electric Switch Corporation, Minerva, Ohio

Application August 6, 1936, Serial No. 94,518

10 Claims. (Cl. 200—171)

1. In a switch mechanism, the combination of a plurality of switch blades, a plurality of contacts pivotally supporting said blades, a plurality of pairs of complemental contacts for receiving said blades, means for simultaneously actuating said blades, comprising an actuating lever provided with a crank disposed transversely of said

blades, a cross bar having keyhole slots receiving said blades, the blades having opposed notches in their edges to receive the reduced portions of said slots, the slots permitting limited lateral movement of the blades, the notches in the blades preventing movement of the cross bar longitudinally of the blades, and an upwardly projecting arm on said cross bar slotted to receive the crank of said actuating lever.



2,097,941

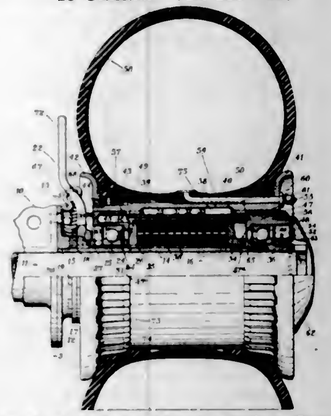
BOTTLE CARRIER CARTON

Raymond Wells, Bridgeboro, and Herbert M. Kieckhefer, Riverton, N. J., assignors, by mesne assignments, to Kieckhefer Container Company, Delair, N. J., a corporation of Delaware

Application January 23, 1936, Serial No. 60,444

6 Claims. (Cl. 229—27)

1. A carrier carton comprising a box-like body formed from an elongated blank having a pair of overlapping side walls secured to one another in assembly, and a partition-forming member foldably connected to the overlapped one of said overlapping walls and projecting at an angle into the carton, the upper portion of said member being in the form of a carrying handle and projecting through the top of the carton.



2,097,942

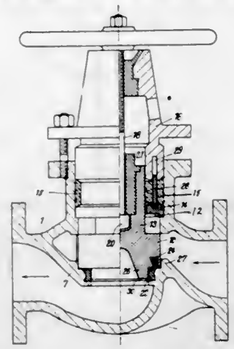
BRAKE MECHANISM

Maurice P. Whitney, Elmira, N. Y., assignor to Eclipse Machine Company, Elmira, N. Y., a corporation of New York

Application December 20, 1929, Serial No. 415,570

15 Claims. (Cl. 188—18)

1. In an aeroplane wheel, a hub, a fixed anchor member extending within said hub, cooperating brake members non-rotatably fixed respectively to the hub and anchor member, said anchor member having a grooved portion, a bearing for the hub seated on the grooved portion of said anchor member, controlling means for said brake members extending in said grooves beneath the bearing member and manually operated means for actuating said control means.



2,097,943

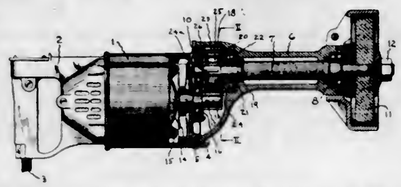
VALVE

Johann Zagorski, Berlin, Germany

Original application November 25, 1931, Serial No. 577,349. Divided and this application July 23, 1936, Serial No. 92,097. In Germany November 25, 1930

2 Claims. (Cl. 251—50)

1. A valve comprising a valve body, a diaphragm in said body, provided with a circular passage, an annular seat on top of said passage, a movable valve member of completely closed cross section for engaging said seat and closing said passage, a reciprocable piston of smaller diameter than the smallest periphery of said seat, forming part of said valve member, a hollow cylindrical valve body portion about said piston arranged concentrically to the diaphragm passage and having a sufficiently large internal diameter to allow the introduction of said valve member into said valve body, and a stuffing box in the annular space between said piston and said cylindrical valve body portion and comprising a reciprocably mounted base ring exposed to the interior of the valve body over essentially the entire annular area included between the adjacent circumferences of said cylindrical valve body portion and said piston and packing in said annular space above said base ring.



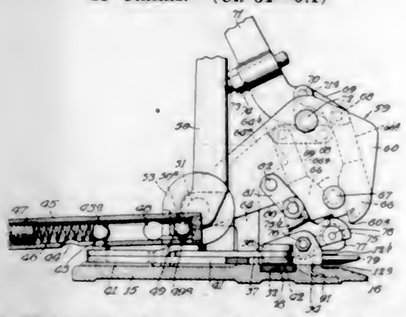
2,097,944

GRINDING MACHINE

Ledgeworth G. Casey, Cincinnati, Ohio, assignor to The Cincinnati Electrical Tool Company, Cincinnati, Ohio, a corporation of Ohio

Application February 1, 1937, Serial No. 123,328

8 Claims. (Cl. 51—170)



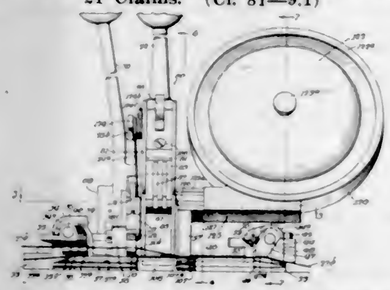
5. In a portable electric hand grinder, a frame, a wheel spindle rotatably mounted in said frame, a grinding wheel mounted on said wheel spindle, an electric motor incorporated in said frame, an over-running clutch mounted on said wheel spindle, and means inter-connecting said motor with said clutch whereby said wheel spindle may be rotated by said motor and said motor may not be rotated by said wheel spindle.

2,097,945

STRAP STRETCHING AND SEALING DEVICE

William C. Childress, Oak Park, Ill., assignor to Acme Steel Company, Chicago, Ill., a corporation of Illinois

Application February 10, 1932, Serial No. 592,050
Renewed February 25, 1937
13 Claims. (Cl. 81—9.1)



1. The combination in a strap sealing device of means for supporting a strap with its ends overlapped, and means for engaging said overlapped ends and rolling them transversely to form a plurality of pairs of telescoping beads along the edges of the strap, said last named means comprising parts for shearing the overlapped ends of the strap transversely thereof at the ends of said beads.

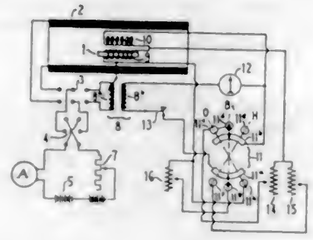
2,097,946

STRAP SEALING APPARATUS

William C. Childress, Oak Park, Ill., assignor to Acme Steel Company, Chicago, Ill., a corporation of Illinois

Application June 13, 1934, Serial No. 730,471
21 Claims. (Cl. 81—9.1)

1. The combination in strap sealing apparatus, of means for holding a strap with its ends overlapping, a sealing device, means for storing a series of connected seals in the form of a coil, means for feeding the end seal of the coil from said storage means and positioning said seal in a position wherein it engages and is supported by said sealing device, and means for thereafter cutting off said seal from the remainder of the coil.



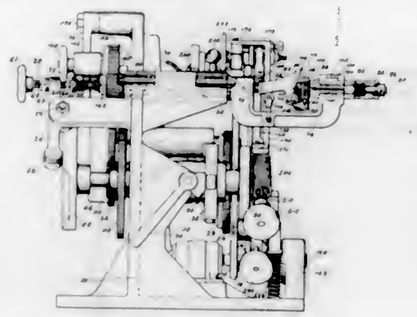
2,097,947

METHOD OF AND APPARATUS FOR MAGNETIC TESTING

Frank P. Fahy, New Rochelle, N. Y.

Application September 2, 1933, Serial No. 687,935
18 Claims. (Cl. 175—183)

8. Apparatus for magnetic testing, comprising means for subjecting a test body to the effects of a changing magnetomotive force, a coil encircling said test body, a second coil positioned away from said test body, said second coil being dissimilar in area-turns to said first coil and having its ends affixed to magnetic pole pieces in contact with



said test body; means including a resistance connected across the terminals of said second coil for measuring the intrinsic flux characteristics of said test body and means for measuring the magnetizing force acting upon said test body.

2,097,948

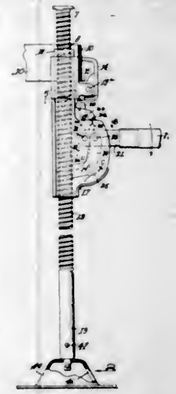
AUTOMATIC EDGESETTER

Merton W. Howard, Haverhill, Mass., assignor to Pope Machinery Corporation, Haverhill, Mass., a corporation of Massachusetts

Application October 18, 1935, Serial No. 45,555
16 Claims. (Cl. 12—72)

1. An edgesetting machine for heel toplifts, comprising an edgesetting iron, means for supporting said iron in a predetermined operating position, means including a rotatable heel jack for supporting a heel in operative relation to said iron, continuously operating means for alternately oscillating and locking said jack through predetermined periods of oscillation and rest, and means for driving said continuously operating means.

2,097,949



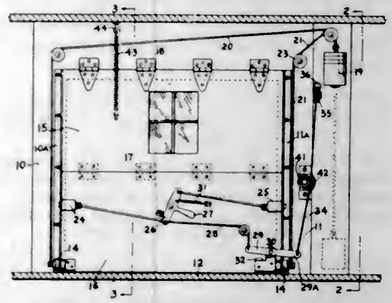
BUMPER JACK

Alvin L. Johnson, Toledo, Ohio, assignor to The Logan Gear Company, Toledo, Ohio, a corporation of Ohio

Application September 1, 1936, Serial No. 98,911
9 Claims. (Cl. 254—111)

1. As an article of manufacture, a jack having a vertical rod provided with teeth, a pawl motion, a housing for the pawl motion, by which pawl

motion the housing can be supported on the rod, a member surrounding the rod and a pivoted



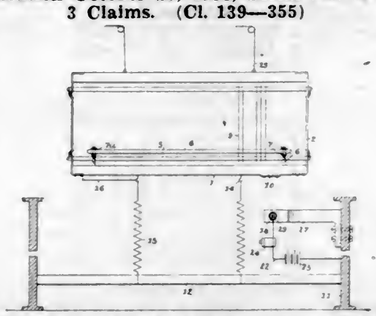
clamp bar associated with said member for clamping the bumper of an automobile.

2,097,950

OVERHEAD DOOR

Orville C. Johnson, Aurora, Ill.

Application December 3, 1936, Serial No. 113,960
4 Claims. (Cl. 268—74)



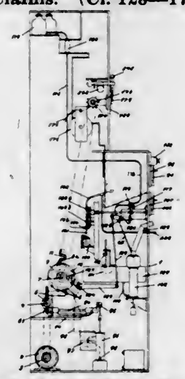
1. In combination with a doorway including complementary jambs and a bridging lintel, an overhead door closing said doorway and comprising linked upper and lower panels having a free marginal upper panel edge hingedly suspended from the lintel to allow of unobstructedly swinging the respective panels away from said jambs into a relatively folded open position, counterbalancing means cooperating with said door, a guide pulley located contiguous to the lintel, a single cable for manually actuating said door in opposed swing directions, said cable having one end attached to the bottom edge region of the lower panel and being run over said guide pulley for manipulation at the other cable end, and a reversing pulley interposed between said guide pulley and the sill level of said doorway, said door when swung into its fully opened position serving to carry the attached cable end therewith to initiate a loop in a medial cable portion about said reversing pulley prior to reaching such open position and which bottom edge of the lower panel is brought contiguous to said free marginal upper panel edge whereby to uphold the folded panels in stabilized non-dropping relationship with respect to the door sill.

2,097,951

WARP STOP MOTION FOR LOOMS

John J. Kearby, Paterson, N. J.

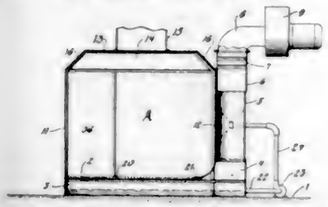
Application October 20, 1936, Serial No. 106,598
3 Claims. (Cl. 139—355)



2. In an electric warp stop motion mechanism, the combination, with a vertically reciprocatory heddle carrying structure for electro-conductive heddles, said structure including an elongated substantially horizontal electro-conductive member and vertical threaded posts, of a substantially horizontal electro-conductive strip having a longitudinal heddle seat on which any fallen heddle may rest, said member and strip being adapted to penetrate heddles in said structure normally held elevated by the warp out of contact with said seat and to be bridged by a fallen heddle, and said structure insulating said member and strip from each other and also including nuts screwed on the posts and between which said strip is held clamped.

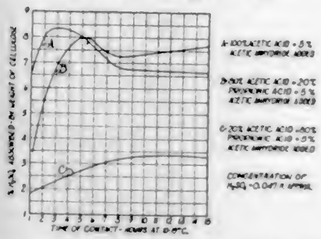
2,097,952

METHOD OF AND MEANS FOR FACIAL TREATMENTS



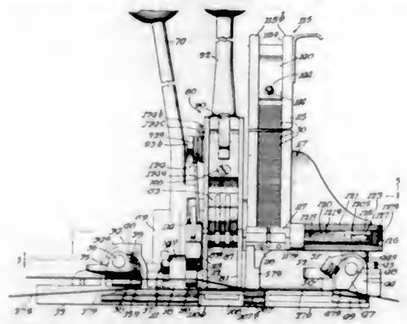
Hans Lohr, Jackson Heights, Long Island, N. Y., assignor to Filor Famous Facial Corp., Long Island City, N. Y.

Application April 14, 1931, Serial No. 530,034
In Germany April 14, 1930
37 Claims. (Cl. 128—172)



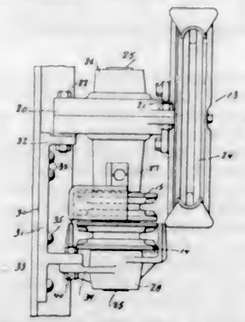
1. The method of applying a facial treatment to a person's head in an enclosure, comprising conditioning the atmosphere surrounding the head in the enclosure, subjecting the skin of the face to physical treatments while it is exposed to the conditioned atmosphere of said enclosure, and altering the condition of the atmosphere surrounding the head in the enclosure during such treatments in predetermined relationship to the treatments.

2,097,953
SPRAY BOOTH
John E. Ludwig, Detroit, Mich., assignor to Newcomb David Company, Inc., Detroit, Mich., a corporation of Michigan
Application March 28, 1935, Serial No. 13,463
4 Claims. (Cl. 91—60)



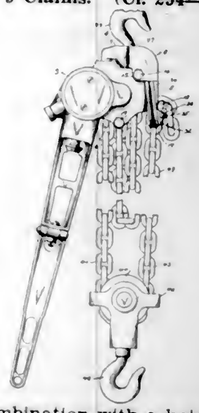
1. A ventilated paint reclaiming spray booth having in combination a spray room having a roof, side walls, and floor, an air inlet for conducting air through said roof, a water reservoir under said floor, venting apertures in said floor spaced from the first one of said side walls for venting the spray room into said water reservoir, additional venting means in said floor adjacent the second one of the side walls, air circulating means, a conduit conductively connecting said air circulating means for drawing air from said water reservoir, and a double nozzle in said conduit for discharging a heavy spray of water across the entire cross-section of the conduit whereby all the air drawn from the water reservoir under the spray room must pass through said water spray.

2,097,954
HIGH VISCOSITY ORGANIC ESTERS OF CELLULOSE AND PROCESS OF PREPARING THEM
Carl J. Malm, Rochester, N. Y., assignor, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey
Application September 5, 1934, Serial No. 742,732
16 Claims. (Cl. 260—101)



1. A process for treating cellulose to obtain an organic acid ester of cellulose having an acetic acid-tetrachloroethane viscosity of 170–300 seconds and an acyl content predominantly acetyl, which comprises esterifying each unit of cellulose in at least eight units of a bath which is a solvent for the ester produced, the bath including fatty acid groups of 3–4 carbon atoms in the amount of 5%–40% of the bath's total acyl content, sufficient lower fatty acid anhydride to substantially completely acylate the cellulose, and from 4% to about 20% sulphuric acid based on the weight of the cellulose, the esterification being carried out at a temperature which will not cause the ester viscosity to drop below 170 seconds.

2,097,955
STRAP SEALING APPARATUS
Ralph H. Norton, Chicago, Ill., assignor to Acme Steel Company, Chicago, Ill., a corporation of Illinois
Application May 25, 1934, Serial No. 727,455
13 Claims. (Cl. 81—9.1)



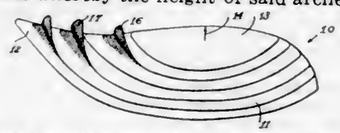
1. The combination in strap sealing apparatus, of means for holding a strap with its ends overlapping, a head movable transversely to said strap ends and having a pair of relatively movable jaws, a seal magazine mounted at the side of said head, a plunger movable transversely to the path of movement of said head for feeding a seal from said magazine to a position between said jaws, stretching means for drawing said strap taut around a package, means actuated by said stretching means for operating said plunger, and means for permitting continued operation of said stretching means after a predetermined movement of said plunger.

2,097,956
HOIST
Frank E. Stahl, Tonawanda, N. Y., assignor to Columbus McKinnon Chain Corporation, Tonawanda, N. Y., a corporation of New York
Application July 6, 1935, Serial No. 30,182
1 Claim. (Cl. 254—167)

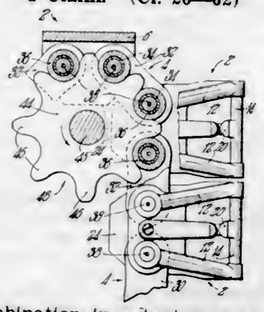
The combination with a hoist, comprising a casing having a shaft extending therethrough, an independent bearing for the shaft, separable from the casing, and provided with a flange, of a bracket for supporting the hoist comprising a flat body and two integral, interspaced, attaching flanges projecting at right angles to said body part, means for securing said body part to a supporting surface, means for securing the casing to one of the flange brackets, and means for securing the flange of said independent bearing to the other bracket flange.

2,097,957
SUSPENSION BRACKET FOR HOISTS
Frank E. Stahl, Tonawanda, N. Y.
Application May 26, 1936, Serial No. 81,894
9 Claims. (Cl. 254—169)

1. The combination with a hoist having a casing, and a hook-receiving aperture formed therein, of a separate, suspension bracket formed with a depending, attaching member for engagement with the hook-receiving aperture of the casing, said bracket being provided with a depending arm formed with means for attaching the end of the load-lift chain of the hoist thereto, a hook for the bracket, and means for universally attaching the hook to the bracket.



2,097,958
ARCH SUPPORT FOR SHOES
Aron Uger, Hamilton, Ontario, Canada
Application August 20, 1936, Serial No. 96,950
1 Claim. (Cl. 36—71)

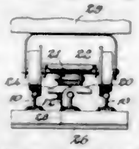


In a shoe, the combination with the insole and an arch support made of relatively stiff leather, of an integral tongue secured to and projecting from the forward end of the arch support and slidably extending through a transverse slot positioned in the insole slightly rearwardly of the metatarsal arch of the foot, and shoulders formed on the arch support adjacent to the tongue and engaging the edge of the slot to limit the forward movement of the tongue within the slot, the major portion of the tongue being positioned underneath the insole and raising that portion of the insole upwardly to constitute a metatarsal pad adjacent to the forward end of the arch support.

2,097,959
ARCH SUPPORT
Hyman L. Whitman, Bridgewater, Mass.
Application June 3, 1937, Serial No. 146,229
7 Claims. (Cl. 36—71)

1. An arch support for shoes comprising a base and a plurality of graduated layers of material disposed thereon, the largest of said layers forming the bottom of said support and being adapted for attachment to said base, the smallest of said layers forming the apex of said support and being adapted to contact the foot, said layers being detachably bonded together by permanently tacky cement to form an arch support for the foot, said layers being of substantially uniform thickness whereby the height of said arched contour may be selectively varied by removal or insertion of individual layers of said material in said support.

2,097,960
CHAIN FOR TENTER MACHINES
John H. Williams, Providence, R. I.
Application July 31, 1935, Serial No. 33,991
1 Claim. (Cl. 26—62)



The combination in a tenter apparatus of, a rotatable driving sprocket and a tenter chain adapted to pass therearound and be engaged thereby, the said chain including: a plurality of tenter clips each of which has a body provided with upper and lower horizontally-disposed spaced flanges connected together, a pair of spaced pins extending between the flanges of each clip adjacent opposite ends thereof, spaced connecting plates disposed adjacent the said spaced flanges extending between and connecting the pins at the adjacent ends of adjacent clips, bushings on each of said pins disposed between the said spaced plates, the center to center distance between the pair of pins of each clip being substantially equal to the center to center distance between the said pins at the adjacent ends of adjacent clips, the said sprocket having alternate teeth and sockets and the said teeth being so spaced that as the said chain passes around the sprocket the said teeth enter successively and one at a time the successive spaces between adjacent bushings and the said bushings are received successively and one at a time by the said sockets in the sprocket.

2,097,961
TOY ELECTRIC RAILWAY
Earl D. Boisselier, Glen Ellyn, Ill., assignor to American Flyer Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application July 7, 1936, Serial No. 89,418
3 Claims. (Cl. 246—81)

1. In a toy railway, a track having a pair of vehicle wheel supporting rails, a third rail between said track rails to carry current, a fourth rail between said track rails and adjacent to said third rail to carry current, a vehicle on said track rails, electrical propelling means for said vehicle electrically connected with said third rail, an electrically operable vehicle signaling device on said vehicle simulating the signaling device of a vehicle of a standard railroad and electrically connected with said fourth rail, an electric circuit including said third rail and said vehicle

propelling means, means in said circuit at a point remote from the vehicle propelling means for opening and closing the same, thereby to control movement of the vehicle along the track, a second electric circuit independent of said first mentioned electric circuit and including said fourth rail and said signaling device, and a switch in said second mentioned circuit at a point remote from the vehicle for opening and closing said

second mentioned circuit at will, thereby to actuate said device without affecting the vehicle propelling means, said second mentioned circuit including a current collector shoe carried by the vehicle for cooperation with the fourth rail, said shoe being mounted for vertical movement relative to the vehicle and being bifurcated to span the third rail and to provide a fourth rail engaging portion at each side of the third rail.

2,097,962

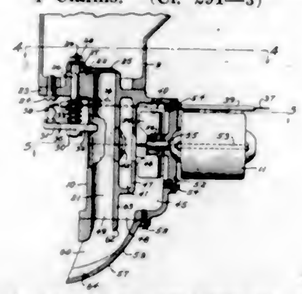
REMOTE CONTROL FOR MACHINE GUNS

Lucien Albert Boussel, Courbevoie, France, assignor to Societe Anonyme des Anciens Etablissements Hotchkiss & Cie., Seine, France, a joint stock company of France

Original application May 10, 1935, Serial No. 20,841. Divided and this application October 12, 1935, Serial No. 44,805. In Great Britain May 1, 1935

11 Claims. (Cl. 89—27)

1. Power means for the remote control of a plurality of machine guns, comprising a single control handle, a repeating relay which includes a distributor of the valve type and motor means of the fluid operated cylinder and piston type having only one inlet end connected to said distributor, a passage from said inlet end to the opposite end of said motor means, valve means operated responsive to the admission of the fluid in said inlet end and adapted when so operated to open said passage in order to allow fluid pressure to pass into said opposite end, reducing means causing fluid pressure in said opposite end to act on the piston with less force than fluid pressure in said inlet end to provide a differential force capable of holding the piston in said opposite end as long as fluid pressure is supplied to said inlet end, an auxiliary fluid container near said inlet end, a passage from said container into said inlet end, a check valve in said passage, means operated by the piston and adapted to depress said check valve when said piston starts from said inlet end and to let it close again when the piston approaches the opposite end, and operative connection between said handle and said distributor and operative connections between said motor means and the triggers of the machine guns to impart to said triggers the control movement of said handle.



2,097,963

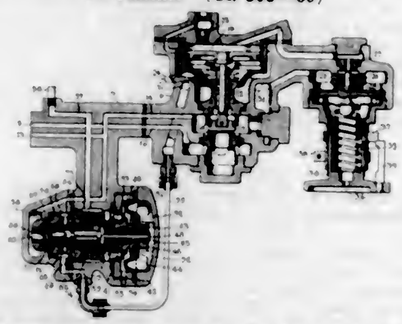
SANDER

Charles P. Cady and Lynn E. Johnson, Canastota, N. Y., assignors to Westlake Manufacturing Corporation, Canastota, N. Y., a corporation of New York

Application February 11, 1936, Serial No. 63,413

4 Claims. (Cl. 291—3)

1. In a device of the class described, a receptacle adapted to contain sand or the like, a sand distributing member depending below said receptacle and having a passage extending through the body thereof for directing the sand from the receptacle to the desired point of discharge, valve means for controlling the flow of sand through said passage, and means for circulating heated air through said distributing member and about said sand passage, said last named means including a drum-shaped chamber having an air intake port substantially axially arranged, and an air passage leading downwardly from said chamber adjacent to the sand passage and having communication with the latter in proximity to the lower end only, an air chamber communicating with the air intake port of said drum-shaped chamber and extending partially about said sand passage and having an air intake port in a lateral wall thereof, an impeller mounted in said drum-shaped chamber, and motor means mounted on said distributing member exteriorly of said drum-shaped chamber and operatively connected with said impeller.



2,097,964

AIR BRAKE

Charles A. Campbell, Watertown, N. Y., assignor to The New York Air Brake Company, a corporation of New Jersey

Application February 25, 1937, Serial No. 127,734

17 Claims. (Cl. 303—59)

3. The combination of a feed valve device including a flow controlling valve, and a pressure responsive device arranged to actuate said valve; and means operable selectively to subject said pressure responsive device to pressure at the discharge side of said valve and at a point remote therefrom.

2,097,965

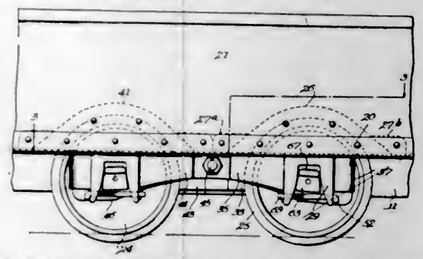
TAG FASTENER

Luther W. Caulk, Jr., Suffolk, Va.

Application December 29, 1936, Serial No. 118,130

1 Claim. (Cl. 40—22)

A fastener for insertion into the eyelet of a tag comprising a flat shank of resilient material having integral with one end thereof a single pair of relative long and narrow barbs upon opposite sides of said shank, respectively, whereby said barbs are flexible for compression inwardly during the passage thereof through said eyelet, the opposite end of said shank being T-shaped to provide a combined head and finger grip portion.



2,097,966

MINE CAR

Glenn E. Edmunds, Columbus, Ohio, assignor to The Bonney-Floyd Company, Columbus, Ohio, a corporation of Ohio

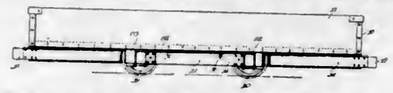
Application September 17, 1934, Serial No. 744,448

6 Claims. (Cl. 105—364)

1. In a car comprising a pair of wheels in tandem relation at one side of the car, a main sill and an outer side frame between which the wheels are disposed, a bolt extending between said sill and frame between the wheels, a pair of yokes having adjacent ends providing barrel portions less in length than the width of the yokes pivoted on said bolt, said yokes extending in the same vertical planes in opposite directions from the bolt, axles mounted in the yokes at their outer portions, the wheels being mounted on said axles, and yieldable weight transmitting means between the outer portions of the yokes and the car structure, the wheels and mounting means being duplicated at the other side of the car.

2,097,967

MINE CAR AND THE LIKE



Glenn E. Edmunds, Columbus, Ohio, assignor to The Bonney-Floyd Company, Columbus, Ohio, a corporation of Ohio

Application April 5, 1935, Serial No. 14,941

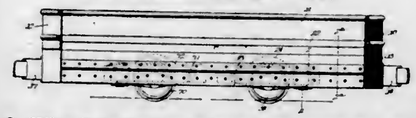
Renewed August 30, 1937

5 Claims. (Cl. 105—364)

1. A car comprising an under-structure and wheels on which said under-structure is supported, mounting means for each wheel comprising a yoke extending in the longitudinal direction of the car and in pivotal connection with the under structure on an axis extending transversely of the car, a stub axle carried by each yoke remote from its pivotal axis and upon which a car wheel is mounted, spring means interposed between the under-structure and each yoke remote from the pivotal axis of the same whereby the under-structure is yieldingly supported on the wheels,

brackets secured to the under-structure at the free ends of the yokes and each having a portion overlying the projecting portion of the adjacent yoke, and tension springs respectively connecting said projecting portions and said overlying portions of the brackets, said brackets including transversely extending walls constituting guards for the springs.

2,097,968



MINE CAR AND THE LIKE

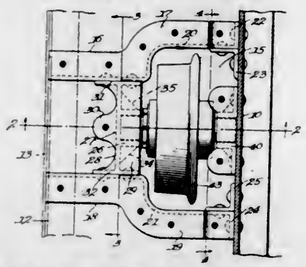
Glenn E. Edmunds, Columbus, Ohio, assignor to The Bonney-Floyd Company, Columbus, Ohio, a corporation of Ohio

Application April 5, 1935, Serial No. 14,942

Renewed February 27, 1937

29 Claims. (Cl. 105—364)

6. Wheel mounting means comprising a housing having top, end and side walls, a pivot bolt supported by the side walls of the housing adjacent one end of the latter, a yoke pivotally supported at one end on said bolt, yieldable means between the other end of the yoke and the top wall of the housing, the yoke having stub axle receiving recesses between its pivoting axis and said yieldable means.

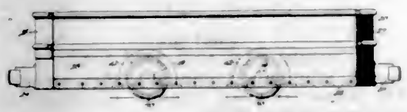


2,097,969

WHEEL MOUNTING

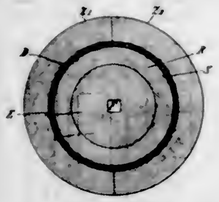
Glenn E. Edmunds and Roy C. Purkhiser, Columbus, Ohio, assignors to The Bonney-Floyd Company, Columbus, Ohio, a corporation of Ohio

Application November 4, 1935, Serial No. 48,232



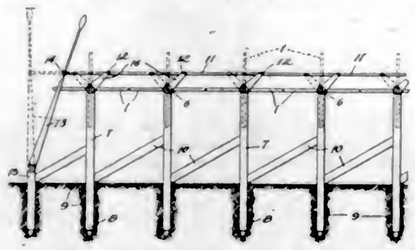
2 Claims. (Cl. 105—364)

1. In a car comprising a main sill and an auxiliary sill spaced outwardly of the main sill, said auxiliary sill having a vertical flange and a horizontal flange, and side flooring extending between said sills and secured to the top portion of the main sill and to the horizontal flange of the auxiliary sill, said flooring having a wheel opening, the



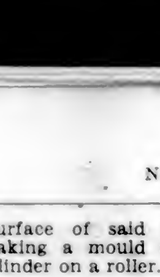
combination of wheel mounting means comprising a pair of transverse stiffener members of which one is at each end of said opening, each of said stiffener members comprising a horizontal flange and a depending vertical flange of which the former laps the flooring and is secured thereto for the support thereof, the outer portions of said members being mutually approached, a bearing between the outer portions of said members and rigidly secured thereto, a second bearing secured to the main sill opposite the first bearing, and a wheeled stub axle journaled in said bearings.

2,097,970
WHEEL MOUNTING
Glenn E. Edmunds, Columbus, Ohio, assignor to The Bonney-Floyd Company, Columbus, Ohio, a corporation of Ohio
Application November 4, 1935, Serial No. 48,233
12 Claims. (Cl. 105—364)



1. In a vehicle comprising an understructure including a pair of longitudinally extending sill members, a frame extending transversely between said members and rigidly secured thereto, a yoke pivotally mounted in said frame on an axis extending longitudinally of the vehicle, a stub axle carried by said yoke in transversely extending relation to the vehicle, a wheel on said axle, said yoke comprising a cross portion on the opposite side of said wheel from said axis, and yieldable means between said cross portion and said understructure.

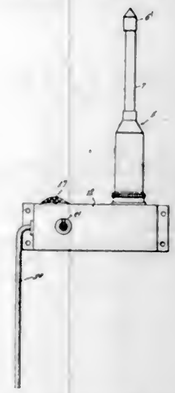
2,097,971
PROCESS OF PRODUCING AN EMBOSSING ROLLER FOR MANUFACTURING LENTICULAR FILM
John Eggert, Leipzig-Gohlis, and Gerd Heymer, Wolfen Kreis Bitterfeld, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
Application March 21, 1935, Serial No. 12,265
In Germany March 27, 1934
2 Claims. (Cl. 76—107)



1. A process of producing an embossing roller for manufacturing lenticular film with embossings transverse to the longitudinal direction of the film which comprises providing a ring on its surface with grooves so that its surface corresponds with the intended surface of the lenticular film, providing a hollow cylinder on its inner surface with a coating of a soft metal so that the inner diameter of said cylinder is somewhat smaller than the outer diameter of said ring, drawing said ring through said cylinder, thus moulding the surface of said ring in said cylinder, and making a mould of said inner surface of said cylinder on a roller.

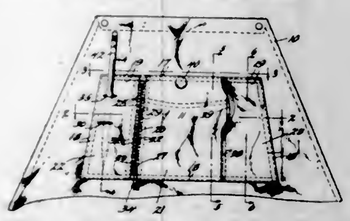
2,097,972
PLANT COVERING
Albert C. Fischer, Chicago, Ill.
Application October 1, 1934, Serial No. 746,339
7 Claims. (Cl. 47—29)

1. A device for protecting plants comprising two parallel rows of supporting columns with columns in the two rows opposite one another, separate frames each pivoted on opposite columns of the two rows, said frames each carrying a transparent panel and being each swingable from a position substantially in alignment with one another where they constitute a closure for the space between the two rows to an open position.



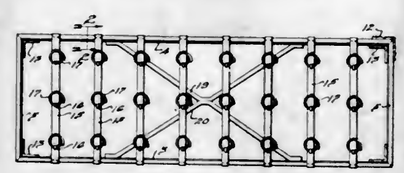
2,097,973
CIGARETTE LIGHTER
Irving Florman, New York, N. Y.
Application January 31, 1935, Serial No. 4,390
6 Claims. (Cl. 67—7)

2. In a lighter having a catalytic body which is heated by the contact of fuel vapors for lighting a cigarette directly, a wick member for holding fuel, and means providing communication between said wick member and said catalytic body, said wick member comprising sterilized cotton from which substantially all grease and oil have been removed.



4. In a cigarette lighter, a casing, a holder slidable in said casing, a catalytic member carried by said holder for engagement by a cigarette to ignite the same, said casing having a fuel chamber therein, said holder including a cup in which said catalyst is mounted having an opening in the bottom thereof, a tube having one end secured in said opening and having its other end adjacent the bottom of the casing, whereby when said holder is moved downwardly in the casing the bottom of said tube engages the bottom of the casing to close the tube and shut off the catalyst from the fuel chamber, said tube having a shoulder thereon adjacent its upper end engaging the bottom of said cup whereby said tube is prevented from passing upwardly through said cup.

2,097,974
SOLDERING IMPLEMENT
Harry Goodchild, Chester, Pa.
Application August 27, 1936, Serial No. 98,248
1 Claim. (Cl. 219—26)

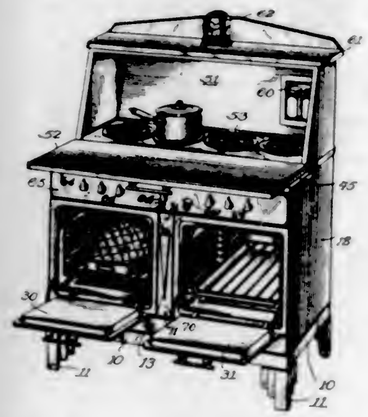


In combination, a soldering tool having at one end a soldering point and at a relatively opposite end a handle, and also having a heating coil connected at one end to said point and at a relatively opposite end to a pair of spaced apart insulated contact prongs extending from the free end of said handle, and a box-like supporting stand for said tool having an electrical outlet plug mounted flush with the top wall of the stand for receiving the contact prongs in a manner to support the tool vertically on the stand, said plug having means for connection with a source of electric current to complete an electric circuit through the heating coil of the tool, and an electrically operable tell-tale signal mounted on the top wall of the said stand and in proximity to the said plug and wired in circuit with said outlet plug, said electrically operable tell-tale signal embodying an electric switch exposed through a side wall of the stand to be operated for controlling the circuit through the signal and the coil of the tool.

2,097,975
GARMENT POCKET
Carl T. Habegger, Berne, Ind., assignor to Berne Manufacturing Company, Berne, Ind., a corporation of Indiana
Application October 7, 1936, Serial No. 104,522
2 Claims. (Cl. 2—247)

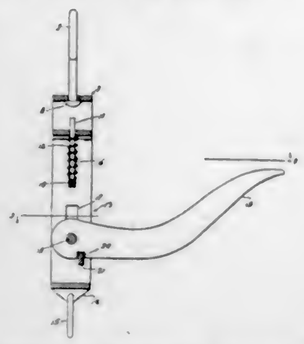
1. A combination pocket for garments including an inner layer formed from the garment, an intermediate layer, and an outer sectional layer, means securing the marginal edges of the intermediate layer to the outer layer, stitching securing the opposite sides and lower end of the intermediate layer and the outer layer to the inner layer to provide a main pocket between the garment and the intermediate layer, said stitching securing the upper ends of the outer layer and the intermediate layer to the inner layer and interrupted between the upper ends of the main pocket to provide a mouth for the latter, said outer layer and intermediate layer coacting to form an auxiliary pocket, said outer layer including end sections and a central section, one of the end sections being separated from the central section to provide an opening for the auxiliary pocket, a slidable closure for said opening, the other end section having its inner marginal edge overlapping the adjacent edge of the central section, a lining between the intermediate layer and the outer layer and coacting with the outer layer to provide a side pocket, and stitching securing the overlapped portions of the central section and the end section, said stitching being interrupted between its ends to provide a mouth for the side pocket.

2,097,976
SEAT FRAME CONSTRUCTION
Alfred H. Haberstump, Detroit, Mich., assignor to The Murray Corporation of America, Detroit, Mich., a corporation of Delaware
Application May 21, 1937, Serial No. 144,074
2 Claims. (Cl. 155—180)



1. In a seat construction, a base frame comprising a plurality of sheet metal members secured together to provide a generally rectangular structure defining the marginal edges of said base frame, each of said members comprising a sheet metal strip folded upon itself in its central portion to provide an attaching flange of double thickness, the lateral portions of said strip being bent to provide a tacking strip receiving channel, brace members disposed interiorly of said frame having their ends anchored to said sheet metal members at opposite sides of said frame to strengthen and brace the same, spring supporting members extending across said frame disposed in a plane substantially parallel to, and above the plane in which said brace members lie, the ends of said spring supporting members lying in overlapping relation with respect to said attaching flange and welded thereto.

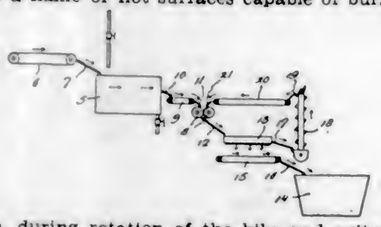
2,097,977
RANGE
Orrin Hofferbert, Beaver Dam, Wis., assignor to Malleable Iron Range Company, a corporation of Wisconsin
Application July 19, 1934, Serial No. 736,093
6 Claims. (Cl. 219—37)



1. A range having vertical enclosing walls and a top, heating units on said top, an enclosure for said units comprising an oven, with the front side

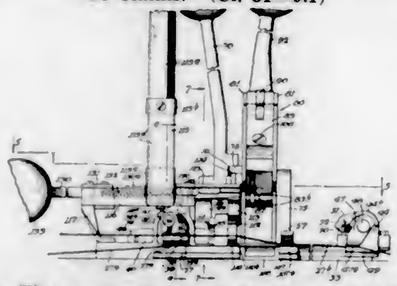
closed by a door hinged at the bottom, whereby said door may be swung to horizontal position on

said top to form a work table and a compartment below said heating units.



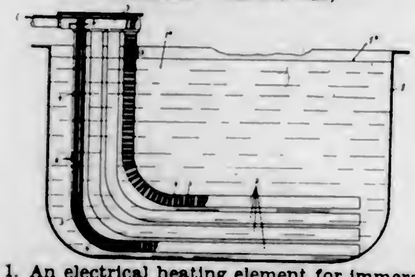
2,097,978
MEAT HOOK
Frank Holladay, Alton, Ill.
Application February 24, 1937, Serial No. 127,535
5 Claims. (Cl. 248—306)

1. In a structural assemblage of the class described, a relatively stationary section, a hook pivotally mounted thereon, a relatively movable section slidably associated with the first-named section and provided with a detent engageable with said hook, and spring means between the sections maintaining said sections in a predetermined order and relationship to hold the hook in a normal meat suspending position.



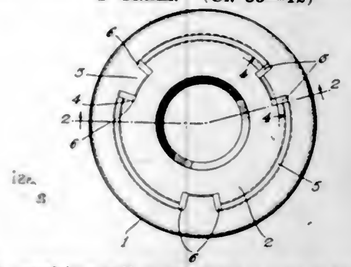
2,097,979
PROCESS OF MAKING LIME
George F. Horton, Houston, Tex.
Application January 13, 1936, Serial No. 58,964
2 Claims. (Cl. 263—53)

1. A process of making lime from pieces and smaller particles of crushed oyster shells consisting of roasting successive batches of the pieces and smaller particles of shells in a rotary kiln by the controlled application of heat at calcining temperatures and so as to exclude said pieces and smaller particles of shells from contact with a flame or hot surfaces capable of burning



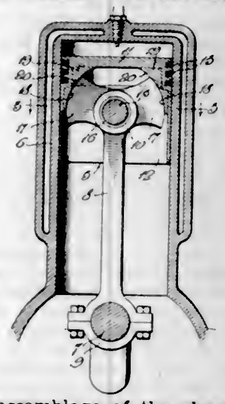
them, during rotation of the kiln and agitation of said pieces and smaller particles.

2,097,980
STRAP SEALING APPARATUS
Squire Julius Johnson, Seattle, Wash., assignor to Acme Steel Company, Chicago, Ill., a corporation of Illinois
Application November 20, 1933, Serial No. 698,835
14 Claims. (Cl. 81—9.1)



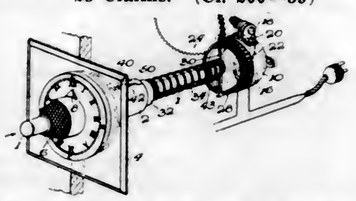
1. The combination in strap sealing apparatus, of means for holding a strap with its ends overlapping, a sealing device, a pivotal support for said device, means for feeding a channel-shaped seal into said device, and means mounted on the device for swinging the same in an arcuate path to bring said seal into engagement with said overlapping strap ends.

2,097,981
IMMERSION HEATER FOR SALT BATHS
Alfred Kärcher, Stuttgart-Cannstatt, Germany, assignor to firm Deutsche Gold- und Silber-Scheideanstalt vormals Roessler, Frankfort-on-the-Main, Germany, a corporation of Germany
Application September 3, 1935, Serial No. 39,030
In Germany September 3, 1934
15 Claims. (Cl. 219—41)



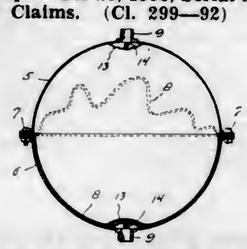
1. An electrical heating element for immersion heating of salt baths comprising a curved pipe having a conductor supported by spaced insulators extending therein, said insulators being substantially flat, and thin in section, and being formed with a plurality of corners which provide substantially point-like bearings for said insulators against the inside walls of said pipe.

2,097,982
ROLL RIM HEAD
Michael J. Kist and Victor A. Kist, Johnstown, Pa.
Application October 14, 1936, Serial No. 105,580
1 Claim. (Cl. 83—12)



A crushing roll comprising a core of relatively soft metal, a replaceable rim of relatively harder metal, a body of readily fusible metal interposed between the core and rim, lugs having inwardly converging faces formed on the rim, said core having slots therein with outwardly diverging faces, and respective pairs of coacting wedges disposed longitudinally between the opposite inwardly converging faces of each of said lugs and the adjacent faces of the core slots and serving initially to accurately position the core relatively to the rim.

2,097,983
PISTON AND ROD ASSEMBLY
Richard J. Kratky, Boise, Idaho
Application October 12, 1936, Serial No. 105,331
5 Claims. (Cl. 309—19)



1. In an assemblage of the class described, a piston having a head, a skirt, and pin bosses; a connecting rod having a pin bearing between said pin bosses; a piston pin passing through said pin bearing and said pin bosses; two arms rigidly secured to the piston end of said rod and projecting in opposite directions therefrom at right angles to the pin axis, said arms having arcuate bearing surfaces on their outer ends, said bearing surfaces being concentric with the piston pin and converging toward the piston head; and bearing abutments rigidly secured to the piston and having arcuate bearing surfaces contacting with said arcuate bearing surfaces of said arms.

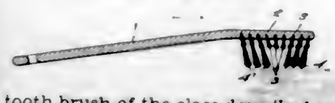
2,097,984
TIME OPERATED SWITCH MECHANISM
Michael Kurek, Crafton, Pa.
Application August 5, 1936, Serial No. 94,473
28 Claims. (Cl. 200—39)

3. In combination with a rotating member, a longitudinally movable plunger, a clutch between said plunger and the rotating member having two axially disposed members movable to and from each other, one member of said clutch being always in co-operative relation with said rotating member, a switch, said clutch and said switch being operated by the longitudinal movement of said plunger, and means for moving said plunger.

2,097,985
FOUNTAIN SPRAYING DEVICE
Anson Abr... Maryott, Alhambra, Calif.
Application September 28, 1936, Serial No. 102,997
3 Claims. (Cl. 299—92)

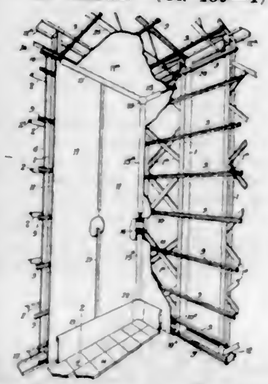
3. In a fountain spraying device of the character described, a dispensing tank of elongated form adapted to constitute a reservoir for the liquid to be sprayed, a flexible diaphragm dividing the interior of said tank into two non-communicating chambers, outlet nipples for said tank arranged intermediate the ends of the latter and at opposite sides of said diaphragm, said nipples being of similar form to facilitate connection of either of the same with a source of supply of water under pressure, said diaphragm being of a character to be actuated by said water under pressure when introduced at one side of said diaphragm to substantially completely discharge a liquid to be sprayed from said tank at the opposite side of said diaphragm, said tank being composed of longitudinal half sections secured together, and the margin of said diaphragm being clamped between the sections of said tank so as to form a watertight joint therebetween, and means for preventing closing of said nipples by said diaphragm.

2,097,986
FISH LURE
Christopher E. McEwen, Nashville, Tenn.
Application October 19, 1936, Serial No. 106,433
2 Claims. (Cl. 43—43)



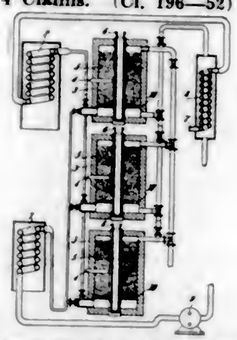
1. A fish lure comprising a body portion, hooks carried by said body portion at desired points, and means within the body portion for propelling the body portion through the water, said means for propelling the body portion comprising a propelling mechanism in one end of the body,

a winding mechanism in the other end of said body and a coiled spring having one end con-



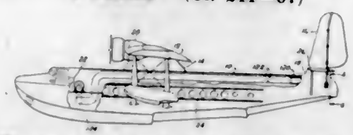
nected to the winding mechanism and its other end connected to said propeller driving mechanism.

2,097,987
TOOTH BRUSH
Charles Edward Phillips, Fresno, Calif., assignor of one-fourth to Thomas Clarke Greene, Fresno, Calif.
Application February 18, 1935, Serial No. 7,088
Renewed August 20, 1937
3 Claims. (Cl. 15—167)



3. A tooth brush of the class described comprising a handle and a head part, said head part having a flat face, longitudinally extending outer rows of bunches of bristles extending from said face, the bunches of bristles at the ends of said rows being relatively long and converging both longitudinally and transversely, and an intermediate longitudinal row of short bunches of bristles extending from said face.

2,097,988
INTERIOR WALL CONSTRUCTION FOR BUILDINGS
David E. Ross and Louis M. Alt, La Fayette, Ind., assignors to Rostone, Incorporated, La Fayette, Ind., a corporation of Indiana
Application January 13, 1934, Serial No. 706,548
17 Claims. (Cl. 189—1)

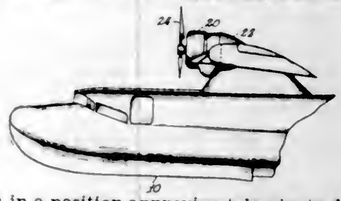


15. In an interior wall construction for buildings; framing; a plurality of prefabricated supporting members attached to the framing; prefabricated wall boards carried by the supporting members; and prefabricated moldings carried by the wall boards and covering the joints between wall boards at the angles of the room.

2,097,989
PROCESS OF CRACKING HYDROCARBONS BY MEANS OF CATALYSTS
Friedrich Schick and Eugen Emilius, Berlin-Mariendorf, Germany, assignors to the Firm Deutsche Erdöl-Aktiengesellschaft, Berlin-Schoneberg, Germany
Application June 8, 1933, Serial No. 674,945
In Germany June 9, 1932
4 Claims. (Cl. 196—52)

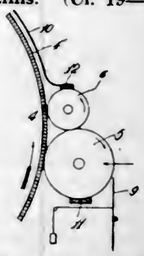
4. In the process of cracking heavy hydrocarbons to produce lower boiling hydrocarbons, the steps of conducting the hydrocarbons through catalytic paths of from 0.3 to 6 meters length at temperatures of from 300° to 500° C. and at a velocity of from 50 to 300 liters per square meter of cross-sectional area of reaction chamber per second, said catalytic paths being composed of coke residues of mineral coals which have been activated by means of steam at a temperature up to about 650° C. and have a low ash content.

2,097,990
ADJUSTING MEANS FOR CONTROL SURFACES
Igor I. Sikorsky, Trumbull, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a company of Delaware
Application September 5, 1935, Serial No. 39,245
6 Claims. (Cl. 244—87)



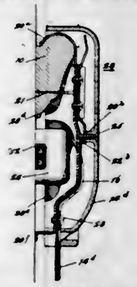
1. In an airplane, a fuselage, a stabilizer adjustably mounted on said fuselage, an extensible strut comprising a screw jack having an axially movable member and a rotatable member disposed between said fuselage and said stabilizer for adjusting said stabilizer, a set of braces extending from opposite sides of said stabilizer into said fuselage, and means operatively connected with the rotatable portion of said screw jack for adjusting the length of said braces to accommodate the braces to the various adjusted positions of the stabilizer.

2,097,991
MECHANIC'S PLATFORM FOR AIRPLANES
Igor I. Sikorsky, Trumbull, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Application March 17, 1936, Serial No. 69,355
6 Claims. (Cl. 244—129)



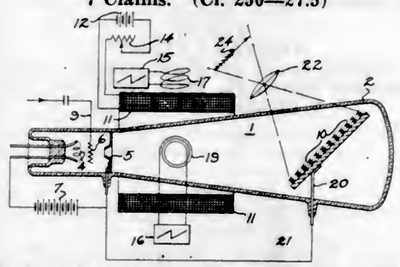
1. In an aircraft having a wing and an engine supported adjacent to said wing, means providing

a platform for the support of a person working on said engine, said means comprising, a movable section of the leading edge of said wing hinged along its lower side to the fixed portion of the wing, means for supporting said movable



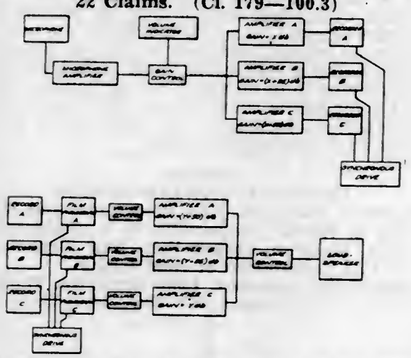
section in a position approximately ninety degrees from its normal position in which it constitutes a continuation of the leading edge surface of said wing, and means forming a tread on the surface of said movable section which is uppermost when in said ninety degree position.

2,097,992
CARDING MACHINE
André Wallaert, Lille, France
Application August 16, 1934, Serial No. 740,181
In France August 17, 1933
2 Claims. (Cl. 19—106)



1. In combination with a carding machine, a rotatable doffer having rigid teeth, a pair of contacting rollers of different diameters, the larger roller bearing against the toothed surface of the doffer so as to be frictionally driven thereby and the smaller roller arranged to rest upon the larger roller so as to be frictionally rotated thereby, the simultaneous rotation of the rollers causing the web to be drawn off from the doffer.

2,097,993
ELECTRIC WIRING SUPPORT
Charles W. Abbott, Larchmont, N. Y., and George A. Johnson, Trumbull, Conn., assignors, by mesne assignments, to said Charles W. Abbott
Application December 15, 1934, Serial No. 757,718
14 Claims. (Cl. 247—1)

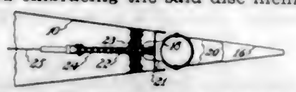


1. In a surface wiring system, a fixedly attached supporting member, a clamp attached to said supporting member adapted to clamp between it and the suporting member the fabric of a fabric-type conductor, and a cover fitting over said clamp and supporting member and fixedly attached thereto, said cover being adapted to cover also a connection between the wires of the fabric conductor and the wires of a surface wiring conduit.

2,097,994
INCANDESCENT SCREEN
Harry S. Bamford, Philadelphia, Pa., assignor to Farnsworth Television Incorporated, San Francisco, Calif., a corporation of California
Application August 18, 1936, Serial No. 96,587
7 Claims. (Cl. 250—27.5)

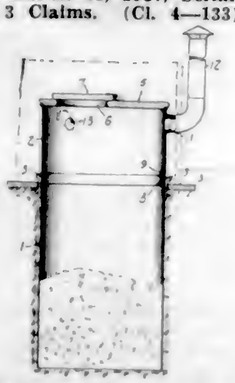
1. A cathode ray tube having an incandescible screen therein composed of a plurality of closely mounted helices of very fine tungsten wire having their axes parallel, and normal to the plane of said screen.

2,097,995
RECORDING AND REPRODUCING OF SOUND
Charles M. Burrill, Haddonfield, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 28, 1936, Serial No. 82,374
22 Claims. (Cl. 179—100.3)



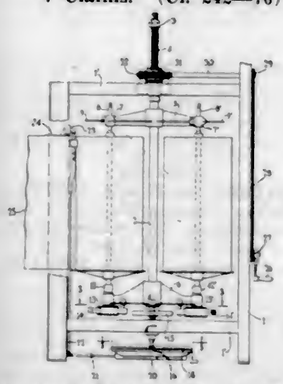
1. The sound record producing method which includes recording the sound on a plurality of tracks at different levels, segregating the high level but not overshot sections of said tracks, and combining said sections to produce said record.

2,097,996
AUXILIARY SURFACE CONTROL
Arthur G. Butler, Eggertsville, N. Y., assignor, by mesne assignments, to Curtiss-Wright Corporation, a corporation of New York
Application November 1, 1935, Serial No. 47,775
3 Claims. (Cl. 244—75)



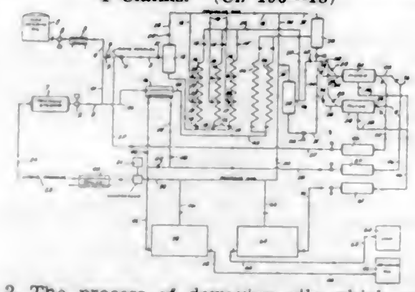
2. In an aircraft control surface having a flap pivotally attached to its rear portion, operating means for said flap comprising a fixed screw shaft transversely mounted within said control surface, a disc member threadedly engaging the said shaft, means associated with the periphery of the disc member adapted to impart rotation and trans-

verse translation of the disc member along said shaft, a bifurcated member attached to said flap member having its bifurcations transversely spaced and embracing the said disc member, the



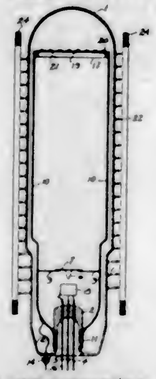
said rotation imparting means passing through the opening between the said bifurcations and serving to maintain the said means in operative relation with said disc.

2,097,997
SANITARY CLOSET
Almond James Crawford, Nyack, Mont.
Application March 11, 1937, Serial No. 130,238
3 Claims. (Cl. 4—133)



1. A sanitary closet for out-house, comprising a lower cylindrical section open at bottom and top and adapted to set in a hole in the ground and to be moved from hole to hole as necessity requires, and a removable upper cylindrical section adapted to fit on said lower section and having a tight fitting cover with a toilet seat, ventilating screen openings in the sides, and a ventilating stack connected thereto.

2,097,998
VERTICAL UNWIND DEVICE
Charles A. Dickhaut, New Brunswick, and Sterling A. Warner, Somerville, N. J., assignors to John Waldron Corporation, New Brunswick, N. J., a corporation of New Jersey
Application March 4, 1936, Serial No. 67,012
7 Claims. (Cl. 242—76)

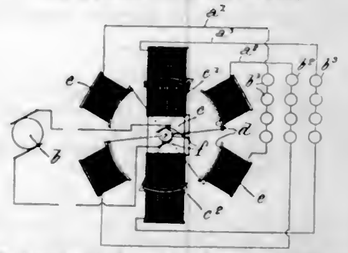


1. In an unwind mechanism, a frame, a shaft journaled in said frame, arms journaled on said shaft, spindles for rolls of material rotatable in said arms, a pneumatic diaphragm to support the end of said shaft, and means for pneumatically moving said diaphragm to change the elevation of said shaft.

2,097,999
PROCESS OF DEWAXING OILS
Eddie M. Dons and Dwight B. Mapes, Tulsa, Okla., assignors to Mid-Continent Petroleum Corporation, Tulsa, Okla., a corporation of Delaware
Application May 3, 1934, Serial No. 723,662
4 Claims. (Cl. 196—18)

2. The process of dewaxing oils which comprises dissolving a wax-containing oil in a liquefied normally gaseous hydrocarbon, suddenly cooling the resultant solution by introducing a stream of chilled normally gaseous hydrocarbon liquid into a stream of said solution, thereafter precipitating wax from the cooled oil while forcing a stream of the resultant material through an elongated passageway to provide a gradual decrease in pressure on the flowing stream and a gradual evaporation of a portion of the normally gaseous hydrocarbon, and separating the precipitated wax from the oil.

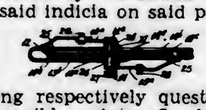
2,098,000
LUMINESCENT SCREEN
Philo T. Farnsworth, San Francisco, Calif., and Bernard C. Gardner, Philadelphia, Pa., assignors to Farnsworth Television Incorporated, San Francisco, Calif., a corporation of California
Substitute for application Serial No. 614,501, May 31, 1932. This application May 6, 1936, Serial No. 78,188
12 Claims. (Cl. 250—27.5)



1. In cathode ray apparatus, the combination of an envelope containing a cathode and an anode cooperating to produce a beam of cathode rays, and woven fabric of refractory material having a pile surface positioned to be bombarded by said beam.

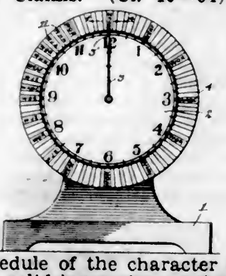
2,098,001
RUBBER BAND GUN
Louis Gagnon and Angeline Gagnon, New York, N. Y.
Application November 17, 1936, Serial No. 111,205
10 Claims. (Cl. 124—19)

1. In a toy rubber band gun simulating a firearm the combination of a stock, a barrel, a substantially vertically disposed rod member slidably mounted in said gun, whereby a rubber band may be stretched between said rod and a point on said barrel, and slidable trigger means for quickly releasing said rubber band from said rod, said last named means including means for raising said rod member whereby to cause said rubber band to be released from said rod.



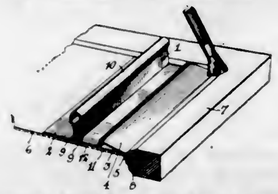
2,098,002
DISPLAY LIGHTING CIRCUITS
Marcel Guérin, Paris, and Paul Breton, Bellevue, France
Application January 12, 1933, Serial No. 651,344
In Belgium January 15, 1932
4 Claims. (Cl. 177—346)

1. A device of the type described, which comprises, in combination, a plurality of electric circuits, electric lamps in said circuits respectively, a plurality of secondary windings connected to said circuits respectively, a source of alternating current, a primary winding connected to the poles of said source adapted to induce current in said secondary windings, rotary means for inductively coupling said primary winding with said secondary windings, successively, whereby the luminous intensities of the respective lamps of said circuits are gradually increased and then decreased, successively, and an auxiliary transformer system having a primary element connected to the poles of said source and at least one secondary part connected with the circuit of one of said secondary windings, for adding a constant electromotive force to the varying electromotive force in said circuit.



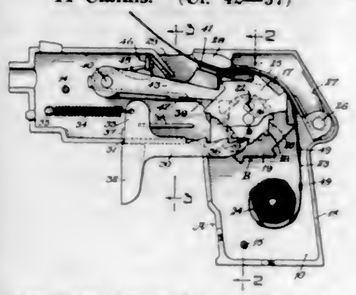
2,098,003
DIAL CARD
Helal Hassenfeld, New York, N. Y.
Application May 4, 1935, Serial No. 19,788
2 Claims. (Cl. 35—74)

1. In a question and answer dial card comprising at least one panel of sheet material, a stud rotatably mounted through and held to said panel, a disc fixed on said stud and substantially covered by said panel, said disc and said panel having indicia in concentric circular columns and radial rows, said panel having a window of substantially equal shape and size to the shape and size of one of said radial rows of indicia on said disc for viewing selectively one radial row of indicia on said disc, said indicia on said panel and said



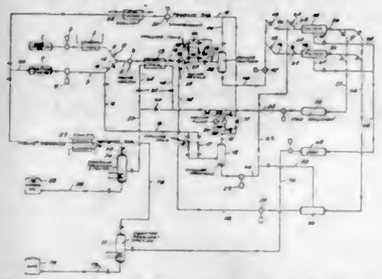
disc comprising respectively questions and answers, an extensible pointer fixed on said stud and thereby rotatable with said disc, the answer to any question pointed out on said panel appearing through said window on said disc in corresponding radial position, said pointer being adjustable in length to the radial extent of the columns of said indicia on said panel, whereby to indicate the radial position of the answer.

2,098,004
PERPETUAL RADIO AND TELEVISION SCHEDULE
Isidor L. Hirschman, Brooklyn, N. Y.
Application July 16, 1936, Serial No. 90,915
4 Claims. (Cl. 40—64)



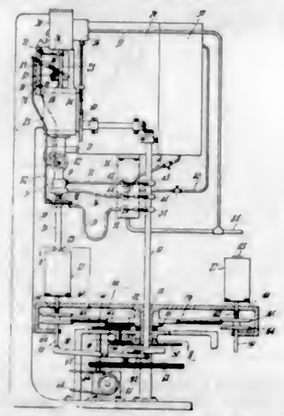
1. In a schedule of the character described, a ring having a solid inner ring section and radial fingers with notches therebetween, a slide plate arranged in each of said notches extending from the front to the rear face thereof so as to be readily grasped between the fingers and the thumb when applying or removing, and means on one face of each of said plates indicating a broadcasting station.

2,098,005
PAINTING SHIELD
Ralph D. Holt, Dumont, N. Y.
Application September 15, 1936, Serial No. 100,893
4 Claims. (Cl. 91—65)



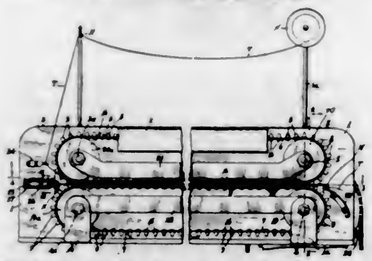
1. A painting shield comprising a pressure bar, a grip or handle at the upper edge of said pressure bar, a laterally extending rest plate located at one side of the pressure bar, and a shield plate located at the opposite side thereof, and both plates being at or near the base of said pressure bar; and means between the effective edge of the shield plate and pressure bar to support the shield plate with its effective edge in the same plane as the rest plate.

2,098,006
CAP PISTOL
Joseph Daugherty Kilgore, Columbus, Ohio, assignor to St. Louis Pistols & Caps, Inc., St. Louis, Mo., a corporation of Missouri
Application May 22, 1937, Serial No. 144,166
11 Claims. (Cl. 42—57)



1. A cap pistol adapted to explode caps on a strip of paper, including a casing having an anvil and an opening adjacent thereto for the escape of the cap strip, a rotary assemblage in the casing adapted when turned to move the cap strip a predetermined distance past the anvil, a spring pressed hammer adapted to engage the caps and explode them against the anvil, a toothed wheel constituting a part of the rotary assemblage adapted to retract the hammer, a second toothed wheel constituting a part of the rotary assemblage, and a longitudinally movable trigger having a plurality of teeth thereon engaging the last-mentioned toothed wheel whereby the movement of the rotary assemblage and number of operations of the hammer to explode caps is governed by the distance the trigger is moved.

2,098,007
PROCESS OF DEWAXING OILS
Dwight B. Mapes and Eddie M. Dons, Tulsa, Okla., assignors to Mid-Continent Petroleum Corporation, Tulsa, Okla., a corporation of Delaware
Application June 8, 1934, Serial No. 729,648
4 Claims. (Cl. 196—18)

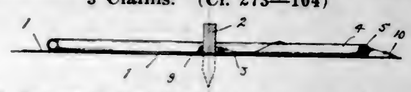


1. The process of dewaxing oils which comprises dissolving a wax-containing oil in a liquefied normally gaseous hydrocarbon, cooling the solution to approximately the temperature at which a cloud of wax appears, suddenly cooling the resultant solution to quickly precipitate wax therein by introducing a stream of chilled normally gaseous hydrocarbon liquid into a stream of said solution, thereafter precipitating additional wax from the cooled oil while forcing a stream of the resultant material through an elongated passageway to provide a gradual decrease in pressure on the flowing stream and a gradual evaporation of a portion of the normally gaseous hydrocarbon, and separating the precipitated wax from the oil.

2,098,008
METHOD OF AND APPARATUS FOR MOLDING ARTICLES OF PAPER PULP
Harvey V. Mitchell, Bridgeport, Conn.
Application January 12, 1935, Serial No. 1,478
16 Claims. (Cl. 92—58)

1. A method of molding articles of paper pulp, which comprises mixing air and pulp stock, passing the mixture through a nozzle into a hollow foraminous mold, and rotating the nozzle on its axis while the mixture is passing therethrough.

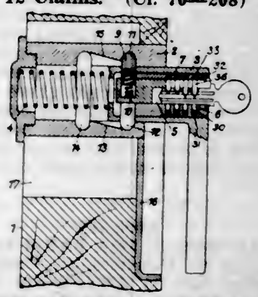
2,098,009
SEWING MECHANISM
Max M. Newman and Morris Opper, New York, N. Y.
Application August 14, 1936, Serial No. 95,967
7 Claims. (Cl. 112—174)



1. Sewing mechanism comprising a pair of endless members, crimpers connected to said endless members and moving in unison with said endless members, the outer ends of said crimpers being separated from each other in the outer runs of said endless members, means for guiding said endless members so that their crimpers intermesh in a portion of the runs of said endless members, said crimpers having recesses which are aligned with each other when said crimpers intermesh, a stationary needle located in said recesses, the walls of the intermeshing portions of said crimpers being sufficiently spaced from each other to permit the pleating of a piece of fabric between said intermeshing crimpers, the inner end walls of said recesses being inclined to the axis of the needle.

2,098,010
PREPARATION OF EMULSIONS
Roy C. Newton, Walter F. Bollens, and Leo C. Brown, Chicago, Ill., assignors to Industrial Patents Corporation, Chicago, Ill., a corporation of Delaware
No Drawing. Application December 7, 1934, Serial No. 756,506. In Canada April 28, 1933
14 Claims. (Cl. 99—122)

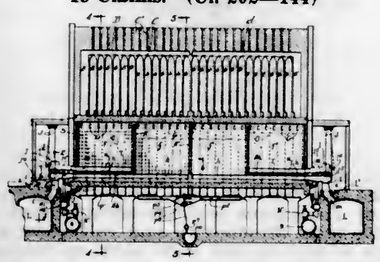
1. The method of preparing emulsions which consists in first preparing a coarse emulsion by the intermixture of oil and moisture, thereafter supercooling the mixture, agitating during and after the cooling, removing from contact with chilling media before any appreciable crystallization has taken place whereby the heat of crystallization will maintain the material near the congealing point of the oil during crystallization, permitting crystallization to continue until the product has set up as a hard, brittle mass and thereafter tempering to bring about the desired plasticity of the fat in the emulsion.



12. The method of preparing emulsions of oil and moisture which comprises cooling the oil to a temperature below its normal congealing point and while the oil is in a supercooled liquid condition, emulsifying moisture with the oil, removing the emulsion from contact with the chilling medium and thereafter permitting the oil in the emulsion to congeal.

2,098,011
GAME
Helmer J. Osvold, Thompson, Minn.
Application December 7, 1936, Serial No. 114,628
3 Claims. (Cl. 273—104)

1. In game apparatus an annulus of rubber tubing, a disc of flexible material for support of said annulus, means for temporarily attaching said annulus to said disc, and an upstanding pin attached axially of said disc.



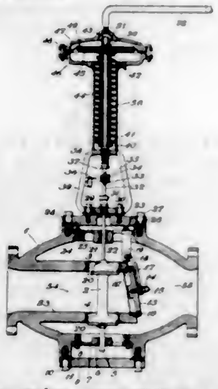
2,098,012
LOCK AND MORE PARTICULARLY DOOR LOCK FOR AUTOMOBILES
Max Papst, Paris, France
Application September 8, 1933, Serial No. 688,608
In Germany December 16, 1932
12 Claims. (Cl. 70—208)

1. In a door lock having a roll-back the combination of a handle having a shank, said handle and shank having an operative and an inoperative position, coupling means coaxial with said shank and adapted to prevent relative rotation of said shank and said roll-back and to permit axial displacement of said shank and said handle into the operative position and out of the same against the door surface, means in connection with the door surface for preventing rotation of said handle in its inoperative position, a spring actuated latch bolt having two locking positions with respect to said shank and adapted to automatically lock said handle in its two end positions, a cylinder lock within the shank, and eccentric means adapted to retract the latch bolt from one of its locking positions and to tension the latch bolt spring for engagement of the latch bolt in the second locking position on a turn of the lock in one direction, and to retract the latch bolt from its second locking position and to tension the latch bolt spring for engagement of the latch bolt in its first locking position on a turn of the lock in the reverse direction.

12. In a door lock having a roll-back the combination of a handle having a shank, said handle and shank having an extended or operative and a retracted or inoperative position, coupling means coaxial with said shank and adapted to prevent relative rotation of said shank and said roll-back and to permit axial displacement of said shank and said handle into the operative position and out of the same to inoperative position against the door surface, means in connection with the door surface for preventing rotation of said handle in its inoperative position, a spring adapted to move the handle automatically into the operative position, a resiliently operated latch member having two latching positions with respect to said shank and adapted to automatically lock said handle in its two end positions, and means within the shank operable to remove said latch member from one of its locking positions by a movement in one direction and from the other locking position by a reverse movement.

2,098,013
COMBINATION REGENERATIVE COKE OVEN
William Hesser Pavitt, Bronxville, N. Y., assignor to Adele Johnson Wilputte, New Rochelle, N. Y.
Application August 8, 1933, Serial No. 684,131
15 Claims. (Cl. 202—144)

1. A coke oven structure, comprising in combination a series of alternate coking chambers and heating walls therefor arranged side by side in a row, each heating wall being formed with two end to end upper horizontal channels extending along respective halves of the wall and with an interior group and an exterior group of vertical flues beneath each horizontal channel and connected at their upper ends to the latter, spaced apart pillar walls one beneath and parallel to each heating wall, regenerators in the space between each two adjacent pillar walls arranged in two side by side rows extending longitudinally of said pillar walls and each of said rows of regenerators including two interior and two exterior regenerators connected, respectively, to the lower ends of the flues of the two interior and two exterior groups of flues of the heating



wall above the pillar wall adjacent the row of regenerators, whereby the said flues in each half of a heating wall and one interior and one exterior regenerator at each side of the subjacent pillar wall constitute the regenerators and flues of a heating unit individual to said half of the heating wall, separate sole channels for the regenerator chambers of each heating unit extending into the structure from the adjacent side of the latter, the sole channels for the two regenerator chambers between two adjacent pillar walls and immediately adjacent the same side of the structure being arranged side by side and directly above the two sole channels for the regenerator chambers in end to end relation respectively with said two regenerator chambers, connections external to said structure for supplying air and fuel gas to, and withdrawing products of combustion from the regenerator chambers through said sole channels for the use of the regenerator chambers between alternate pairs of adjacent pillar walls in optionally preheating lean fuel gas and air or for preheating air only in the remaining regenerator chambers, and means for supplying rich fuel gas to the different vertical flues.

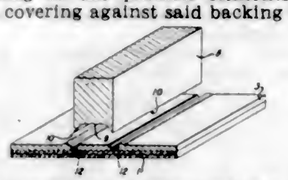
2,098,014

PIPE LINE SYSTEM AND VALVE THEREFOR

John Ray Polston, Tulsa, Okla., assignor to Stanolind Pipe Line Company, Tulsa, Okla., a corporation of Maine

Application July 11, 1936, Serial No. 90,159
6 Claims. (Cl. 137—78)

1. A unitary valve comprising a valve body divided into two chambers, a valve member controlling an opening between said two chambers, a valve stem attached to said valve member, a spring acting on said valve stem, a diaphragm acting on said valve stem, means for exerting pressure on said diaphragm in opposition to the force of said spring, the position of said valve member being controlled by the relative magnitude of the opposing forces, and a check valve member controlling a second opening between said two chambers of said valve body.



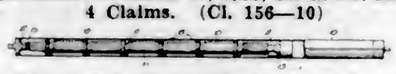
2,098,015

METHOD OF MAKING INLAID LINOLEUM

William Rowe, Oakland, and Abraham Beck Miller, Berkeley, Calif., assignors to The Paraffine Companies, Inc., San Francisco, Calif., a corporation of Delaware

Application May 22, 1935, Serial No. 22,734
5 Claims. (Cl. 154—26)

1. The method of making covering materials of the linoleum class which includes the steps of overlaying loosely a sheet of uncured straight line linoleum material upon a backing, pressing limited sharply defined portions of said sheet corresponding to the pattern elements of the completed covering against said backing to cause



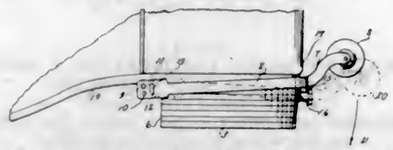
adherence thereto by said portions and to cause shearing of the linoleum material at the boundaries of said adherent portions, and stripping the remaining non-adherent portions of said sheet from said backing.

2,098,016

CURTAIN CONSTRUCTION

Frank A. Schuetz, Elkhart, Ind., assignor to The Adlake Company, Chicago, Ill., a corporation of Illinois

Application November 12, 1936, Serial No. 110,451
4 Claims. (Cl. 156—10)



2. The combination with a rod, and a tube surrounding the rod in spaced relation thereto, of a coil spring on the rod within the tube, and a number of felt inserts in the form of split helical rings positioned at intervals between adjoining coils of the spring in both inwardly and outwardly projecting relation to the coils for preventing the spring from bearing against either the rod or the tube.

2,098,017

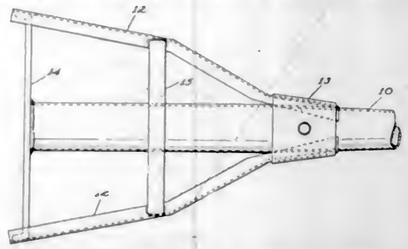
SNAP-ON SPUR RETAINER

William Julius Seyfarth, Phoenix, Ariz.

Application July 12, 1937, Serial No. 153,141
4 Claims. (Cl. 36—1)

1. A snap-on spur for riding boots comprising a solid spur body having a spur attached to its rounded rear portion and having forwardly extending tines adapted to receive a tension spring there-between, a tension spring attached to said tines and extending laterally there-between in combination with a retaining peg extending outwardly from the rear rounded portion of the boot heel and lugs extending outwardly from the forward flat vertical face of said boot heel.

2,098,018



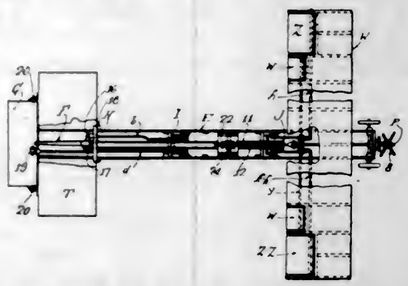
STEEL TONGUE FOR FARM TRUCKS

Daniel W. Voorhees, Jr., Peru, Ill.

Application July 24, 1936, Serial No. 92,289
2 Claims. (Cl. 278—43)

1. A steel tongue for a farm truck in combination, a seamed tubular sheet metal body, vertically aligned openings in the forward portion of said body, a whiffle plate having an opening in registry with said openings in the body, a horizontal brace welded to the rear end of said tongue

body and extending laterally thereof, channel iron braces welded to said tongue body and whiffle plate and extending rearwardly and laterally for



welded attachment to the respective outer ends of the first mentioned brace, steel tubes cooperating with the openings in said body and whiffle plate and welded thereto.

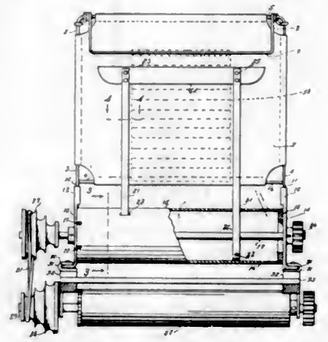
2,098,019

MECHANICAL AUTOMATIC PILOT

Louis Weimerskirch, Pittsburgh, Pa.

Application October 24, 1935, Serial No. 46,552
5 Claims. (Cl. 46—78)

1. In a flying machine comprising ailerons, elevators and a single rudder, individual longitudinally slidable cams mounted within the body of the fuselage of said machine and adapted to control the movements thereof to cause said machine to perform pre-determined evolutions, and unitary means to slide said cams and propel said flying machine.



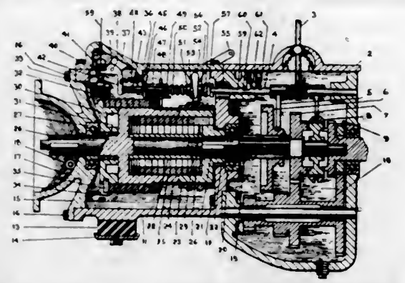
2,098,020

COPY HOLDER FOR USE IN CONNECTION WITH TYPEWRITING MACHINES

James S. Wheeler, Phoenix, Ariz.

Application May 19, 1936, Serial No. 80,524
5 Claims. (Cl. 120—34)

1. A copy holder for use in connection with a typewriting machine including in combination a base comprising a horizontally positioned cylinder having end plates, means for removably attaching said end plates to the platen carriage of the typewriter, drums carried on an axially positioned shaft within said cylinder adapted to carry flexible steel ribbons having a normally arcuate section to provide longitudinal stiffness, said cylinder being provided with slots whereby said ribbons protrude vertically therefrom, a horizontal marker bar affixed at the ends of said protruding ribbons, means, including a framework provided with a diaphragm-like back and a horizontal cross bar yieldably attached thereto, to hold work to be copied, and means for communicating rotary motion at a pre-determined relative rate between the platen shaft and the shaft carrying said drums whereby said ribbons may



be wound upon said drums by the operation of the platen on said typewriting machine.

2,098,021

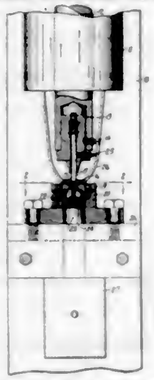
CONTROL SYSTEM FOR TRANSMISSIONS

Phillip R. Wheeler, Alexandria, Va.

Application June 30, 1932, Serial No. 620,268
21 Claims. (Cl. 192—4)

1. In a no-back device for controlling the movement of a shaft, a coil-like member having several turns about the shaft, the said member being designed to tighten on the shaft when it is rotated in one direction and to loosen when the shaft is rotated in the other direction, means for holding one end of the coil-like member, means for releasing the said end, and means engaging the other end of the said coil member after the first said end is released.

2,098,022



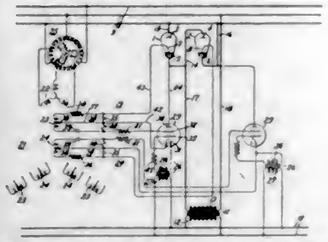
NIBBLING MACHINE

Harry W. Williams, Dayton, Ohio, assignor to The National Cash Register Company, Dayton, Ohio, a corporation of Maryland

Application September 12, 1935, Serial No. 40,215
3 Claims. (Cl. 164—50)

1. In a nibbling machine of the character described, the combination of a reciprocating punch having a cutting edge on all sides thereof to which work may be presented from any direction; a work feed limiting pilot integral with the punch and adjacent the cutting edge thereof; a die having an opening to receive the punch; a holder for the die, said holder having an opening registering with the opening in the die; and a web within the opening in the holder, said web having a guiding surface cooperating with the work feed lim-

iting pilot to maintain the cutting edge of the punch in alinement with the opening in the die



regardless of the direction from which the work is presented to the punch.

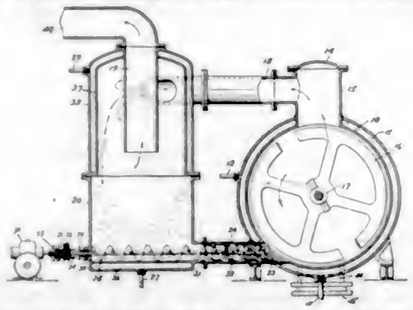
2,098,023

ELECTRIC VALVE TRANSLATING CIRCUITS

Ernst F. W. Alexanderson, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application February 29, 1936, Serial No. 66,433
9 Claims. (Cl. 250—27)

1. In combination, a supply circuit, a load circuit, electric valve means interconnecting said circuits, and a circuit comprising electronic discharge means of the gaseous type for controlling the conductivity of said electric valve means conjointly in accordance with predetermined electrical conditions of said supply circuit and said load circuit, said electronic discharge means comprising two control members each energized in accordance with a different one of said electrical conditions.



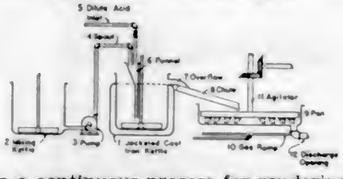
2,098,024

VACUUM DRIER WITH CENTRIFUGAL DUST SEPARATOR

Lawrence H. Bailey, Philadelphia, Pa., assignor to F. J. Stokes Machine Company, Philadelphia, Pa., a corporation of Pennsylvania

Application April 8, 1935, Serial No. 15,164
Renewed September 28, 1937
7 Claims. (Cl. 34—7)

6. Apparatus for drying powdered material comprising, a vacuum drier for containing the material to be dried, a vacuum-producing means for removing fluid from the material in said drier and for incidentally removing material which is entrained by said fluid, means for separating said entrained material from said fluid interposed between said drier and said vacuum-producing means, a conduit from said last-mentioned means to said drier, and a conveyor in said conduit for receiving material from said last-mentioned means and for returning said material to said drier and for compressing said material against



said conduit at the point of return of said material to said drier to prevent the escape of fluid at this point.

2,098,025

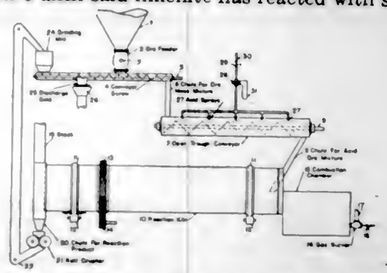
PROCESS OF RECOVERING SOLUBLE TITANIUM COMPOUNDS FROM TITANIFEROUS ORES

James E. Booge, Wilmington, Ignace J. Krchma, Elmhurst, and Robert M. McKinney, Roselle, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours and Company, a corporation of Delaware

Application November 23, 1935, Serial No. 51,254
6 Claims. (Cl. 75—115)

1. In a continuous process for rendering water soluble the titanium values of a titaniferous ore, the steps of mixing said ore in comminuted condition with sulfuric acid, feeding said ore and acid into a reaction zone in which the reaction between said ore and said acid is initiated, removing the initiated reaction mass from said zone before the reaction is completed, and feeding it into a second zone in which the mass is subjected to attrition and continuously moved forward toward the discharge end of said second zone and maintaining said mass in said second zone at elevated temperature, so that the mass is discharged therefrom in solid comminuted form.

2,098,026



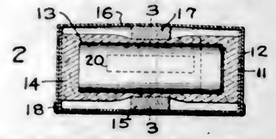
METHOD OF ATTACKING WATER INSOLUBLE TITANIFEROUS MATERIAL

James E. Booge, Wilmington, Ignace J. Krchma, Elmhurst, and Robert M. McKinney, Roselle, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours and Company, a corporation of Delaware

Application November 23, 1935, Serial No. 51,255
8 Claims. (Cl. 75—115)

1. The process of recovering soluble sulfates of iron and titanium from ilmenite ore, which comprises the steps of mixing ilmenite with solid iron and titanium sulfates obtained in a previous operation of attacking ilmenite ore with sulfuric acid, adding to said mixture an amount of sulfuric acid adapted to react with said ilmenite ore, adjusting the amounts of the ingredients of said mixture so as to obtain a solid, granular product before said ilmenite has reacted with said acid,

feeding said granular material into a reaction zone in which it is heated to about 180° C., maintaining said mass under agitation at elevated temperature until said ilmenite has reacted with said



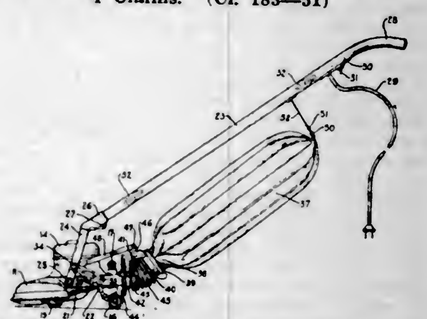
acid, separating from the solid reacted mass a substantial part thereof and mixing it with a fresh portion of ilmenite and sulfuric acid and submitting this mixture to a subsequent heating step.

2,098,027

EXTERMINATING DEVICE FOR BUGS AND INSECTS

Guy S. Boyd and Stephen H. Boyd, York, Pa.

Application January 27, 1937, Serial No. 122,524
3 Claims. (Cl. 43—131)



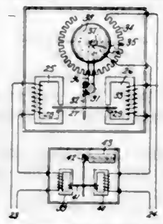
1. An exterminating device of the type described comprising a box, a vial of poison supported in spaced relation to the walls of said box, an absorbent material enclosing said vial and adapted to absorb poison from the vial when said vial is broken, means bearing against said vial and adapted to crush the same when the exterior of the box is struck by an implement, openings formed in said box to permit pests and the like to enter the same, and means detachably secured to the exterior of the box for closing said openings to prevent access to be had to the interior of the box until after the vial is broken.

2,098,028

SUCTION CLEANER

Chandos Burkhardt, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application March 26, 1936, Serial No. 70,953
4 Claims. (Cl. 183—51)



4. In a suction cleaner, the combination of a body provided with a discharge outlet and a handle pivotally mounted thereon remote from said outlet, a dirt bag adapted to communicate with the said discharge outlet, a support for the mouth of said bag having pivotal connection with said body at said discharge outlet, and a link pivotally connected at one end to said bag mouth supporting member at a point radially offset from its pivotal point and at its other end with said handle adjacent its pivotal mounting on said cleaner body whereby the mouth of said bag will move substantially with said handle.

2,098,029

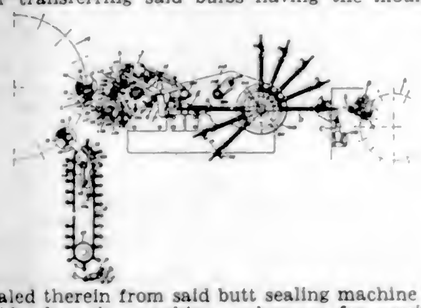
ELECTRICAL INSTRUMENT

Herbert Dallmann, Karlshorst, Germany, assignor to General Electric Company, a corporation of New York

Application January 23, 1934, Serial No. 708,010
In Germany February 22, 1933
1 Claim. (Cl. 171—95)

Apparatus responsive to the ratio between two currents comprising a rotatable element composed of current conducting material, a device actuated by one of said currents for producing a resultant shifting magnetic field acting upon said element, a second device actuated by the other of said currents and acting in opposition to said first mentioned device for producing a second resultant shifting magnetic field also acting upon said element, a rheostat connected in parallel to said second mentioned device to divert an adjustable portion of current therefrom, and having a resistance adjusting member mechanically connected to said rotatable element, the connection being such that rotation of said rotatable element varies the resistance of said rheostat in a direction required to divert a sufficient portion of current from said second field producing device to balance the effects of said field producing devices on said rotatable element, whereby the position assumed by said element provides an indication of the ratio between said currents.

2,098,030



MACHINE FOR MANUFACTURING INCANDESCENT LAMPS

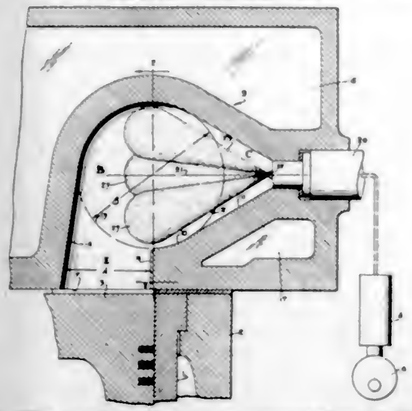
John F. Donovan and George Illingworth, East Cleveland, Ohio, assignors to General Electric Company, a corporation of New York

Application June 30, 1934, Serial No. 733,157
16 Claims. (Cl. 176—3)

1. A unitary and completely automatic machine for making incandescent lamps comprising a mount making machine for manufacturing mounts comprising two lead wires having juxtaposed portions which are held together and support a filament at their inner ends, the outer ends of said lead wires extending transversely to the said juxtaposed portions, transfer mechanism adjacent said mount making machine for transferring a mount directly from said mount making machine and disposing it in a glass bulb which is disposed in a neck-up position, a machine for butt-sealing a glass exhaust tube to the neck of

said bulb and enclosing portions of the lead wires in the joint, a machine for exhausting said bulb and tipping off said exhaust tube, mechanism for transferring said bulbs having the mounts

sealed therein from said butt sealing machine to said exhausting machine, and means for causing said mechanisms to operate in proper time relation.



2,098,031

INTERNAL COMBUSTION ENGINE

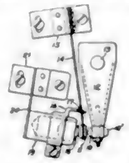
Max Essl, Drexel Hill, Pa., assignor to Baldwin-Southwark Corporation, a corporation of Delaware

Application June 11, 1935, Serial No. 25,997

7 Claims. (Cl. 123—32)

1. The combination in a compression-ignition internal combustion engine comprising, an engine cylinder, means forming a substantially pear-shaped water cooled combustion chamber having a large end and a relatively short conical portion whose wall merges substantially tangentially with the wall of said large end of the chamber, means for injecting from the small end of said chamber a multiplicity of fuel sprays terminating freely within the outer radial portions of the large end of the chamber in substantially symmetrical relation to the chamber axis, and a passage for admitting air from the engine cylinder to said chamber substantially tangential to the large end thereof, thereby to impart maximum whirling air turbulence within the chamber adjacent the points where the free ends of said fuel sprays terminate.

2,098,032



CONTACT MECHANISM

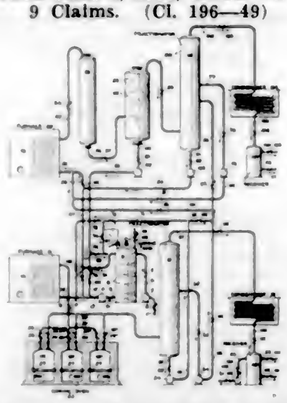
John A. Favre, Rutledge, Pa., assignor to General Electric Company, a corporation of New York

Application March 23, 1937, Serial No. 132,513

16 Claims. (Cl. 200—153)

6. A contact mechanism including relatively movable co-operating contacts, means for actuating one of said contacts to engage the other contact, means for preventing rebound of said contacts on engagement thereof including a rollable member in the path of movement of said contacts

for substantially instantaneously taking over the kinetic energy of the contacts on engagement thereof, and means for retarding the rolling action of said member whereby to dissipate the energy transferred thereto.



2,098,033

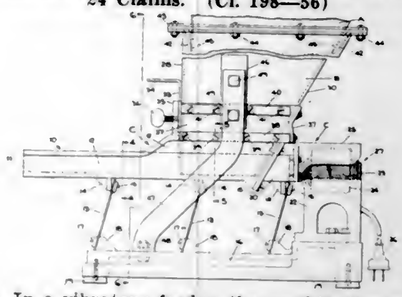
CONVERSION AND COKING OF HYDROCARBONS

Alfred Fisher, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

Application June 2, 1933, Serial No. 674,001

9 Claims. (Cl. 196—49)

1. A process for the pyrolytic conversion and coking of a charging stock mixture of finely divided carbonaceous material in hydrocarbon oil which comprises subjecting the mixture to elevated temperature under non-coking conditions, introducing the heated products into a coking zone wherein the residue is coked in a relatively thin layer upon a highly heated surface, subjecting the vaporous products from the coking zone to fractionation whereby their fractions boiling above the range of the desired final light distillate product are condensed as intermediate liquid products, subjecting the fractionated vapors to condensation, returning high boiling components of said intermediate liquid products of the coking operation for further treatment with the charging stock mixture, simultaneously subjecting selected lower boiling components of said intermediate liquid products of the coking operation to conversion under independently controlled conditions, separating the resulting vaporous and residual liquid conversion products, returning the residual liquid for further treatment with the charging stock mixture, subjecting the vaporous conversion products to fractionation whereby their insufficiently converted components are condensed as reflux condensate, subjecting fractionated vapors of the desired end-boiling point to condensation, and returning the reflux condensate for further treatment in the same system.



2,098,034

VIBRATORY FEEDER

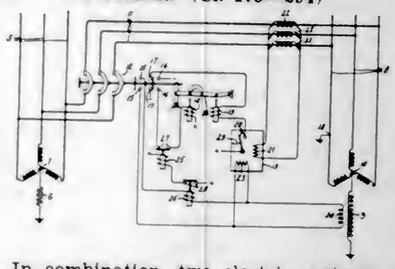
James A. Flint and Arthur D. Holt, Columbus, Ohio, assignors to The Traylor Vibrator Company, a corporation of Colorado

Application April 19, 1935, Serial No. 17,244

24 Claims. (Cl. 198—56)

1. In a vibratory feeder, the combination with a vibratory conveyor deck, of a base, spring means attaching said deck and base whereby said deck will have a conveying action when vibrated, a vibratory motor having a portion attached to said base and another portion attached to said deck, a hopper adapted to feed material to said deck, and means connecting said hopper and said base whereby vibrations in said base will be imparted to said hopper.

2,098,035



PROTECTION OF ELECTRIC SYSTEMS

Komao Fukushima, Tokyo, Japan, assignor to General Electric Company, a corporation of New York

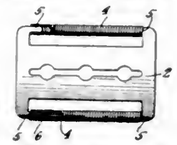
Application October 20, 1936, Serial No. 106,704

In Japan December 7, 1935

7 Claims. (Cl. 175—294)

1. In combination, two electric systems each having a grounded neutral, a tie line interconnecting said systems for exchange of power, means responsive to a ground fault on one of said systems accompanied by ground fault current flow from the other system through said tie line to said one system for rendering said tie line nonconductive, and means effective after the disappearance of the ground fault for re-establishing the conductivity of said tie line.

2,098,036



SAFETY RAZOR

Thomas Gore, Brooklyn, N. Y.

Application May 23, 1936, Serial No. 81,397

1 Claim. (Cl. 30—83)

In a safety razor having a razor blade and holding means therefor, a non-rotatable combined guard and skin-stretching member having an engagement surface located, as regards the direction of the cutting stroke, in advance of the cutting edge of the blade and in spaced relation thereto, said surface consisting of a helical mem-

ber the convolutions of which extend obliquely with respect to the cutting edge and are in contact with each other.

2,098,037

RUBBER TIRE

Eardley Hazell, New York, and Stewart R. Ogilby, West New Brighton, N. Y., assignors to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application February 6, 1935, Serial No. 5,248

9 Claims. (Cl. 154—40)

9. In the process of making a tire casing with cords comprising artificial silk, the steps of applying a coating from an aqueous dispersion of rubber containing casein and carbon black next to the cords, drying, applying a layer of vulcanizable rubber over said first coating, and thereafter vulcanizing whereby, the rubber layer will be securely bonded to the cords by the first coating.

2,098,038

RUBBER TIRE

Eardley Hazell, New York, and Stewart R. Ogilby, West New Brighton, N. Y., assignors to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application March 12, 1935, Serial No. 10,676

19 Claims. (Cl. 154—40)

12. A pneumatic tire casing having plies of fabric containing cords comprising artificial silk and vulcanized rubber intermediate the fabric plies, and the solids deposit of a composition comprising rubber latex and aqueous casein dispersed whole tire carbon black-containing reclaimed rubber particles in the proportion of one part latex solids to two parts reclaim solids and containing about 10% casein based on the total solids, bonding the said vulcanized rubber to the said fabric plies.

2,098,039

PREPARATION OF SECONDARY AROMATIC AMINES

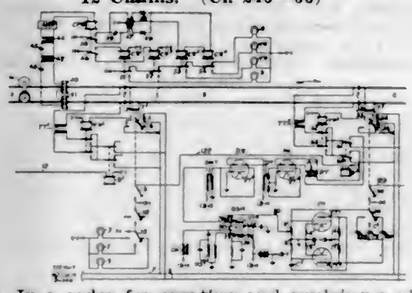
Alfred G. Hill, Bound Brook, N. J., and Arthur J. Hill, New Haven, Conn., assignors to The Calco Chemical Company, Inc., Bound Brook, N. J., a corporation of Delaware

No Drawing. Application December 6, 1935, Serial No. 53,208

20 Claims. (Cl. 260—128)

1. A method of producing secondary amines included in the group consisting of aromatic amines and heterocyclic amines containing a secondary amino group outside of the heterocyclic ring which comprises vaporizing the corresponding primary amine in the absence of the corresponding phenol and passing the vapors over a catalyst containing a major proportion of an oxide of a metal included in the group consisting of aluminum and titanium, at a temperature above 400° C.

8. A method of producing secondary aromatic amines which comprises vaporizing the corresponding primary amine in the absence of the



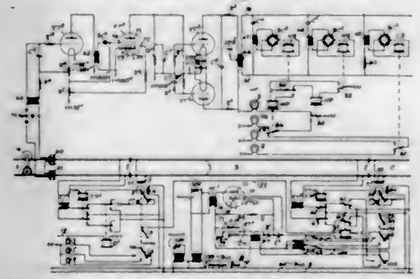
corresponding phenol, passing the vapors at reaction temperature over a catalyst containing a major portion of aluminum oxide until the catalyst efficiency diminishes below the point of economic production, regenerating the catalyst by passing hot air thereover at a temperature sufficiently high to burn out organic impurities and reusing the reactivated catalyst.

2,098,040

CONTINUOUS INDUCTIVE CODED TYPE TRAIN CONTROL SYSTEM

Walter H. Hoppe, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.

Application June 29, 1935, Serial No. 29,116
12 Claims. (Cl. 246—63)



1. In a coder for creating and applying a plurality of selected codes to a railway track circuit, a vacuum tube oscillator-mixer, means controlled by said oscillator-mixer for supplying an alternating current of fixed frequency to said track circuit, a vacuum tube modulator, means controlled by said modulator and said oscillator-mixer for forming said alternating current into codes comprising said fixed frequency current modulated at different rates, means including a plurality of electrical condensers for controlling said modulator in accordance with the codes to be formed, and means controlled in accordance with traffic conditions for selectively connecting said condensers to said modulator.

2,098,041

CONTINUOUS INDUCTIVE CODED CAB SIGNALING SYSTEM

Walter H. Hoppe, Rochester, N. Y., assignor to General Railway Signal Company, Rochester, N. Y.

Application March 19, 1936, Serial No. 69,618
22 Claims. (Cl. 246—63)

18. In a coded track circuit for railroads, track rails, a load circuit including said track rails, circuit means for connecting said load circuit to a source of high frequency alternating current, and an arc discharge device included in said circuit means for applying current from said current source to said load circuit at different low frequency rates.

2,098,042

STENCIL SHEET

Shinjiro Horii, Tokyo, Japan

No Drawing. Application May 27, 1936, Serial No. 82,090
1 Claim. (Cl. 41—38.6)

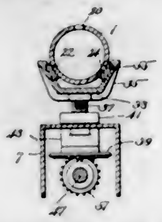
A stencil sheet, comprising a base of fibrous material material coated with a composition including gelatine, mono- or di-oleic acid ester of glycerine, mono- or di-oleic acid ester of ethylene glycol, oleic acid, Turkey-red oil, a heavy mineral oil, Prussian blue, organic lakes, kaolin, powdered agalmatolite, hexamethylentetramine, and a preservative.

2,098,043

STENCIL SHEET

Shinjiro Horii, Kanda-ku, Tokyo, Japan

No Drawing. Application May 7, 1937, Serial No. 141,248. In Japan March 31, 1937
2 Claims. (Cl. 41—38.6)



2. A stencil sheet consisting of a base of fibrous material coated with a coating material comprising gelatine, oleic acid di-glyceride, glycol oleate, oleyl alcohol, a heavy mineral oil, Turkey-red oil, ultramarine blue, diatomaceous earth, water, cyclohexanol, hexamethylenetetramine and a preservative.

2,098,044

VACUUM EXTRACTOR

James D. Hunter and Frank B. Morrill, North Adams, Mass., assignors to The James Hunter Machine Company, North Adams, Mass., a corporation of Massachusetts

Application January 14, 1937, Serial No. 120,637
7 Claims. (Cl. 34—48)

1. A vacuum extractor for web material having in combination means defining a vacuum chamber adapted to be connected to a vacuum pump and having a plurality of extracting slots of different widths, means for selectively bringing one of such slots into working relation with a traveling web, and means for closing the remaining slots against ingress of air.

2,098,045

TREATMENT OF HYDROCARBONS

Vladimir Ipatieff and Vasili Komarewsky, Chicago, Ill., assignors to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application July 18, 1935, Serial No. 32,036
6 Claims. (Cl. 260—168)

1. A process for the alkylation of aromatic hydrocarbons to produce more valuable products therefrom, which comprises subjecting a mixture comprising said aromatic hydrocarbons and paraffinic hydrocarbons to the action of an acid of phosphorus at an alkylating temperature between approximately 700° F. and 900° F. whereby the paraffinic hydrocarbons undergo decomposition, the products of which decomposition combine with said aromatic hydrocarbon to alkylate same, and recovering the alkyl derivatives thus formed.

2,098,046

TREATMENT OF HYDROCARBONS

Vladimir Ipatieff and Vasili Komarewsky, Chicago, Ill., assignors to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application August 16, 1935, Serial No. 36,560
4 Claims. (Cl. 260—167)

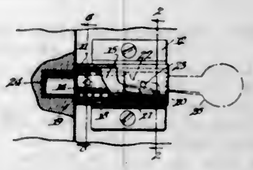
1. A process for producing alkylated hydrocarbons which comprises reacting a paraffin and a naphthenic hydrocarbon at destructive alkylation temperature of from about 700° F. to 900° F. and in the presence of orthophosphoric acid.

2,098,047

PROCESS OF RECOVERING MALEIC ACID FROM THE FUME GASES CONTAINING SMALL AMOUNTS THEREOF

Alphons O. Jaeger, Greentree, and Joseph E. Jewett, Pittsburgh, Pa., assignors to American Cyanamid & Chemical Corporation, Bridgeville, Pa., a corporation

No Drawing. Application November 21, 1935, Serial No. 50,839
11 Claims. (Cl. 260—122)



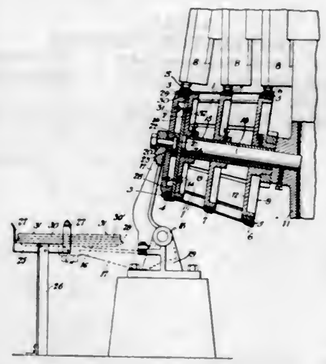
3. A method of producing a concentrated maleic acid liquor from the maleic anhydride containing effluent gases from the condensers of a vapor phase catalytic oxidation plant of aromatic compounds, which comprises scrubbing the exhaust gases from the condenser which contain maleic anhydride in the concentrations normally obtained in the fume gases from catalytic vapor phase organic oxidation plants with a dilute maleic acid liquor, thereby concentrating the liquor, continuously removing the concentrated liquor from the zone of scrubbing, recirculating at least a portion thereof and withdrawing a portion of the concentrated liquor from the circuit.

2,098,048

PIN AND TUMBLER MECHANISM

Herman H. Kistner, Baltimore, Md., assignor to Kistner Lock and Appliance Company, Baltimore, Md., a corporation of Maryland

Application November 9, 1935, Serial No. 49,085
10 Claims. (Cl. 70—141)



1. A bolt lock comprising a body, a sleeve mounted to turn therein, a bolt slidable through the sleeve, one end of the bolt being projectable from the body to engage a keeper and the other end being slotted lengthwise to receive a key, said bolt having spaced transverse openings intersecting said slot and tumbler pins in said openings, said housing having two sets of axially spaced openings respectively mating with said openings in said bolt in retracted and locking position, spring pressed tumblers in each set of openings in said housing, axially spaced slots in said sleeve, respectively adapted to aline with said sets of openings at opposite positions of said sleeve, and means engaging said sleeve for rotating it simultaneously with said bolt whereby said slots respectively uncover one or the other of said sets of openings in said housing at extreme positions of movement of said bolt.

2,098,049

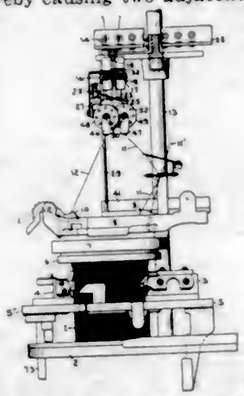
BASKET MANUFACTURE

Sadron C. Lampert, Norfolk, Va., assignor to Farmers Manufacturing Company, Norfolk, Va., a corporation of Virginia

Application January 16, 1937, Serial No. 120,847
8 Claims. (Cl. 1—13.6)

1. The method of making a basket of the raised bottom type, comprising assembling a bottom structure for the basket by placing a basket bottom panel and a preformed liner hoop in mutually centered relation with the edge margin of said panel abutting an edge of said hoop, establishing a holding connection to temporarily secure said panel and hoop in said abutting and centered relation, constructing the side wall of the basket around the hoop and panel in overlapping relation to their peripheries while they are so temporarily held together and driving fastening elements to secure the side wall of the basket to the liner hoop and to the edge of the bottom panel, and then releasing said temporary holding connection.

2,098,050



KNITTING MACHINE

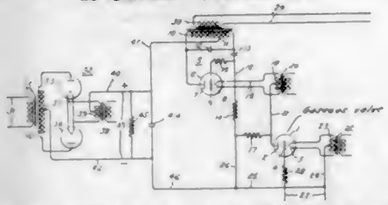
Robert H. Lawson, Pawtucket, and Arthur N. Cloutier, Lonsdale, R. I., assignors to Hemphill Company, Central Falls, R. I., a corporation of Massachusetts

Application August 28, 1933, Serial No. 687,102
19 Claims. (Cl. 66—125)

1. In a multi-feed knitting machine having at least two feeding stations, means for separately knitting two or more yarns at the same time, in combination with yarn controlled elements so associated that the tendency of one such yarn

to be fed to the needles at a faster rate is resisted thereby causing two adjacent courses of a

resultant fabric to be substantially uniform with respect to each other.



2,098,051

OSCILLATOR CONTROL

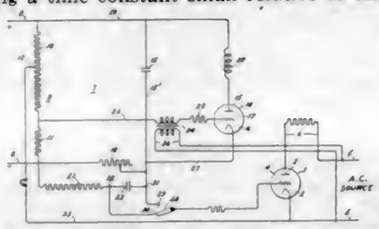
Harold W. Lord, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application March 16, 1936, Serial No. 69,243

18 Claims. (Cl. 171—97)

18. In combination, an alternating current supply circuit, an alternating current load circuit, electric translating apparatus connected therebetween comprising an inductive winding having terminal connections and a connection electrically intermediate said terminal connections, a pair of electric valve means each connected in circuit with a different one of said terminal connections and arranged to transmit current alternately, an electronic discharge device of the type employing an ionizable medium and having a control member connected in circuit with said electric valve means and connected in circuit with said intermediate connection for controlling said electric valve means, a control circuit for energizing said control member, and means comprising a capacitance connected in series relation with said electronic discharge device and an impedance element connected across said capacitance and said electronic discharge device for rendering said device nonconductive at the end of each half cycle of conduction to permit said control member to obtain control.

2,098,052



TIMING CIRCUIT

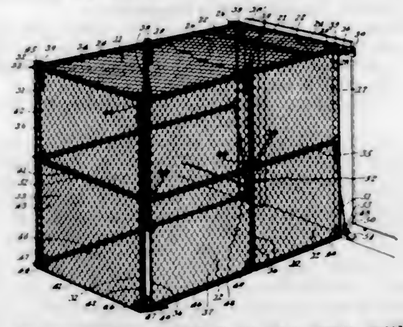
Harold W. Lord, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application March 16, 1936, Serial No. 69,244

14 Claims. (Cl. 250—27)

1. In combination, a source of current, a circuit having a relatively large time constant comprising a capacitance arranged to be charged from said source and means for periodically discharging said capacitance, and a second circuit having a time constant small relative to that of

said first-mentioned circuit and connected to be energized in accordance with an electrical condition of said first-mentioned circuit to provide a periodic timing quantity.



2,098,053

DELIVERY ENCLOSURE

Wayne E. Mack, Martins Ferry, Ohio, assignor to The Consolidated Expanded Metal Companies, Wheeling, W. Va., a corporation of West Virginia

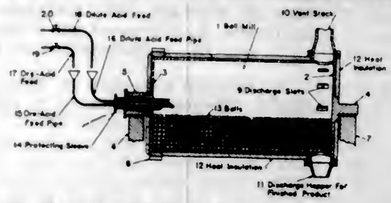
Application June 10, 1936, Serial No. 84,465

10 Claims. (Cl. 20—1.6)

1. An enclosure adapted to cooperate with a delivery opening, comprising a top frame secured above the opening, corner posts supporting the end of the frame remote from the opening, side and end panels having hooks for detachably engaging said frame, and hold-down bars extending through eyes in said panels, at least one end of said bars being secured to a fixed anchorage.

2,098,054

BALL MILL ATTACK OF TITANIFEROUS ORES



Ford H. McBerty, Newark, Del., assignor, by mesne assignments, to E. I. du Pont de Nemours and Company, a corporation of Delaware

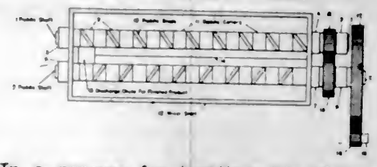
Application November 23, 1935, Serial No. 51,247

5 Claims. (Cl. 75—115)

1. In a process of attacking a titaniferous ore with acid, the steps of feeding sulfuric acid and ore into a reaction zone in which the mixture of acid and ore is broken up into films adhering to loose solid bodies, moving said bodies in said reaction zone in such a manner that they rub against each other, thereby submitting said films to attrition while, at the same time, said acid, ore and the reaction products obtained from the action of said acid upon said ore, move from the feed end of said reaction zone to its discharge end and adjusting the movement of said solid

bodies, the temperature in said reaction zone, the amounts of said reactants and the concen-

tration of said acid in such a manner that the reaction product is discharged as a solid product.



2,098,055

PUG MILL ATTACK OF TITANIFEROUS ORES

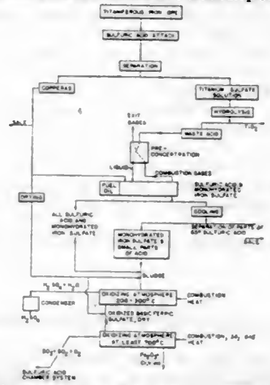
Ford H. McBerty, Newark, Del., assignor, by mesne assignments, to E. I. du Pont de Nemours and Company, a corporation of Delaware

Application November 23, 1935, Serial No. 51,248

8 Claims. (Cl. 75—115)

1. In a process for treating titaniferous ore with sulfuric acid to recover a water soluble titanium compound in solid form which comprises feeding said ore and acid of suitable strength into a reaction zone, initiating the reaction between said acid and ore and moving the reaction mixture away from the zone where the reaction is initiated and keeping the reaction mixture moving until it is discharged in a solid disintegrated form, the step of effecting said movement in said reaction zone by means of a plurality of adjacent and cooperatively acting helicoidal parallel screws rotating at different speeds and adapted to prevent substantial accumulations of reactant materials on each other.

2,098,056



UTILIZATION OF WASTE PRODUCTS IN THE MANUFACTURE OF TITANIUM COMPOUNDS FROM TITANIUM ORES

Ford H. McBerty, Newark, Del., assignor to E. I. du Pont de Nemours & Co., Wilmington, Del., a corporation of Delaware

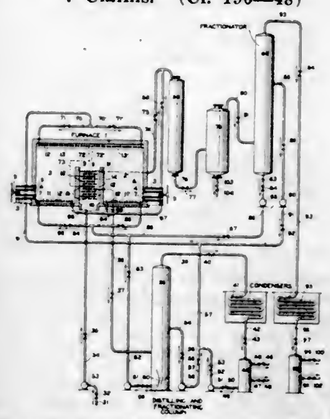
Application February 15, 1936, Serial No. 64,065

5 Claims. (Cl. 23—172)

5. A process for the recovery of valuable products from waste dilute, impure sulfuric acid and crystallized copperas by-products obtained in the manufacture of titanium compounds from titanium ores, comprising initially concentrating to a point of substantial saturation an iron sulfate-waste sulfuric acid solution, increasing the iron content of said initially concentrated solution by adding by-product copperas thereto, further concentrating said solution to a point where the iron sulfate content thereof becomes dehydrated to the monohydrated iron sulfate state and said iron sulfate crystallizes out of solution, subjecting the sulfuric acid-monohydrated sulfate mixture remaining to oxidation under a temperature not to exceed substantially 300° C., recovering the acid distillate and solid oxidized iron sulfate therefrom, decomposing said oxidized iron sulfate in an oxidizing atmosphere and under a temperature of at least 700° C., recovering SO_2 and SO_3 gases as a result of iron sulfate decomposition, and

passing said gases, together with oxygen, into a sulfuric acid chamber system for recovery of sulfuric acid therefrom.

2,098,057



CONVERSION OF HYDROCARBON OILS

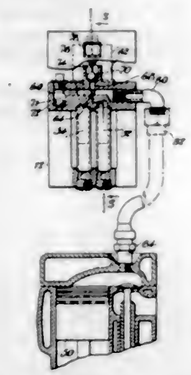
John Warren McCaffrey, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

Application May 23, 1934, Serial No. 727,070

Renewed September 20, 1935

7 Claims. (Cl. 196—48)

1. In a process for the fractional distillation of hydrocarbon oil accompanied by the pyrolytic conversion of selected fractions thereof under independently controlled temperature and pressure conditions in a heating zone employing a heating coil of the type having two independently fired combustion zones with a fluid conduit located adjacent the roof and floor of each and with a centrally located fluid heating zone containing fluid conduits heated by combustion gases from both combustion zones, the improvement which comprises passing hydrocarbon oil charging stock for the process through the fluid conduit located in that portion of the fluid heating zone exposed to the mildest heating conditions therein, whereby to heat the oil to a temperature sufficient to effect its fractional distillation, passing selected high-boiling fractions of the charging stock through the fluid conduits located adjacent the



floor of each combustion zone whereby to rapidly heat the same to the desired conversion temperature, without maintaining the same near the maximum conversion temperature attained for a sufficient time to permit excessive conversion thereof, and passing selected low-boiling fractions of the charging stock first through the fluid conduits located adjacent the roof of each combustion zone, whereby to heat the same to a high conversion temperature, and then passing the stream of low-boiling highly heated oil through the fluid conduit located in that portion of the fluid heating zone exposed to the most severe heating conditions therein, whereby to maintain the same near the maximum conversion temperature attained for a predetermined time.

2,098,058
APPARATUS FOR LOCATING TOP DEAD CENTER

John D. Morgan, South Orange, N. J., assignor, by mesne assignments, to Power Patents Company, Jersey City, N. J., a corporation of Maine

Original application August 15, 1933, Serial No. 685,219. Divided and this application February 19, 1936, Serial No. 64,792

4 Claims. (Cl. 73—51)

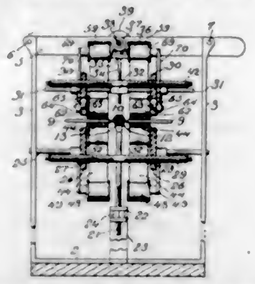
3. A gauge adapted for use in locating top dead center position of a piston in an internal combustion engine comprising, a double U-shaped manometer having a reservoir leg of relatively large cross section communicably connected at its base with the lower ends of each of a pair of upright high and low pressure measuring legs of relatively small cross section, a passage communicably connecting the upper end of the low pressure measuring leg and the reservoir leg, a relief passage communicably connecting the top of the reservoir leg with atmosphere, a pressure chamber and passage communicably connecting same with the upper end of the high pressure measuring leg, a manifold, a conduit and calibrated orifice communicably connecting the manifold with the pressure chamber, a pair of vertically mounted tubular members forming respectively the inlet end of the relief passage in the reservoir leg and the inlet end of the said conduit in the pressure chamber whereby said inlets are spaced respectively from the roof of the reservoir leg and from the floor of the pressure chamber, a pressure relief passage ported out of the manifold and controlled by a weighted pressure relief valve, and a vacuum relief passage ported out of the manifold and controlled by a weighted vacuum relief valve.

2,098,059
TREATMENT OF HYDROCARBON OILS

Jacque C. Morrell, Chicago, Ill., assignor, by mesne assignments, to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application February 18, 1932, Serial No. 593,875. Renewed January 2, 1936

2 Claims. (Cl. 196—36)



2. A method for refining cracked gasoline which comprises passing the gasoline in vapor form through a mass of finely divided heavy metal together with relatively minor amounts of hydrochloric acid and an aldehyde such as to separate sulphur compounds and objectionable olefins from the gasoline vapors, and then condensing and recovering the thus purified gasoline vapors.

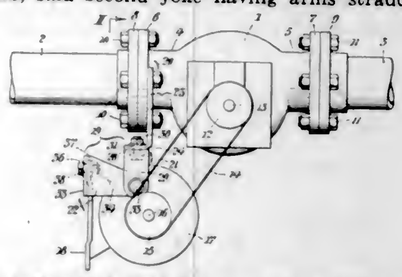
2,098,060
MECHANISM FOR SHAPING THE BACKS OF BOOK COVERS

Allen J. Moyer, Kansas City, Mo., assignor to Interstate Bindery Company, Kansas City, Mo., a corporation of Missouri

Application June 1, 1936, Serial No. 82,823

20 Claims. (Cl. 11—2)

8. In a book cover back shaping mechanism, the combination with rectilinear back shaping means for engaging the inner side of and shaping the back of an open book cover, the sides of which are at opposite sides of said shaping means, of two pairs of endless belts at opposite sides respectively of said shaping means and having rectilinear portions parallel with said shaping means and with each other, and means for driving two of said belts, one of each pair, in directions such that their said parallel portions will travel simultaneously at like speed and in the same direction parallel with said shaping means and with each other, the other two belts being so disposed relative to said driven belts respectively as to have their said parallel portions cooperate with said driven belts to grip the sides of the cover and move the cover endwise while the back of the cover is held against and conformed to said shaping means.



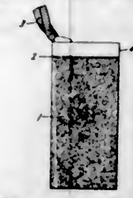
2,098,061
MOTOR SUPPORT

Gonzalo C. Munoz, Philadelphia, and David M. Watson, Ardsley, Pa., assignors to The American Pulley Company, Philadelphia, Pa., a corporation of Pennsylvania

Application July 10, 1935, Serial No. 30,592

7 Claims. (Cl. 248—16)

7. A pivotal suspension support for an electric motor having a pulley coordinated by a belt with the pulley of the device which is to be driven, comprising a fixed bracket; a yoke adjustably secured to the bracket and having arms overreaching the motor casing; and a second yoke supporting the motor with capacity for adjustment and movable relative to the first mentioned yoke, said second yoke having arms straddling



the motor and pivotally connected at their ends to corresponding ends of the arms of said first mentioned yoke.

2,098,062
CARBON BRUSH

Robert Palmer, Niskayuna, N. Y., assignor to General Electric Company, a corporation of New York

Application April 26, 1935, Serial No. 18,374

5 Claims. (Cl. 171—325)

1. In combination, a carbon block, a metal coating integrally united therewith, said metal when molten having the property of wetting carbon.

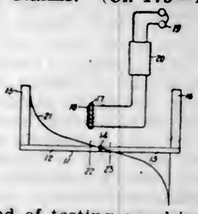
2,098,063
PROCESS FOR DEOXIDATION OF COPPER

René Perrin, Paris, France, assignor to Société d'Electrochimie d'Electrometallurgie et des Aciéries Electriques d'Ugine, Paris, France, a corporation of France

No Drawing. Application June 7, 1937, Serial No. 146,964. In France June 16, 1936

4 Claims. (Cl. 75—76)

1. Process for deoxidation of copper by the action of a deoxidizing flux consisting in causing metaphosphoric acid to act upon a bath of oxidized copper.



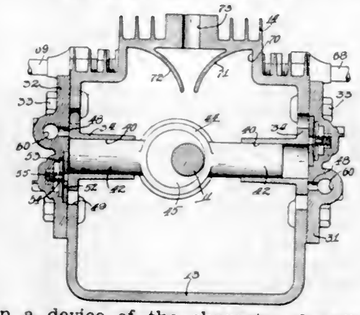
2,098,064
MAGNETIC TESTING DEVICE

Joachim Pfaffenberger, Berlin-Mariendorf, Germany, assignor to General Electric Company, a corporation of New York

Application August 27, 1934, Serial No. 741,702

In Germany September 28, 1933

7 Claims. (Cl. 175—183)



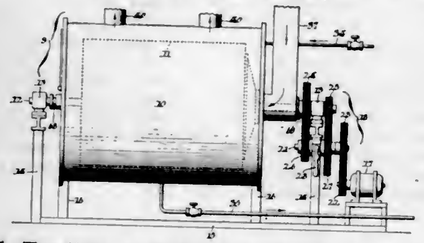
1. A method of testing an object of magnetizable material which comprises magnetizing the object, passing a detecting coil with a magnetic core along the object in a direction parallel with the direction of magnetization with the magnetic axis of said core perpendicular to the direction of magnetization of said object, thereby producing voltage pulsations in said coil due to Barkhausen effect in said core, and observing the points at which pulsations of increased strength occur in the voltages induced in said coil.

2,098,065
COMPRESSOR

Charles L. Rayfield, Chicago, Ill., assignor to Ray Engineering Company, Chicago, Ill., a corporation of Illinois

Application April 13, 1936, Serial No. 73,986

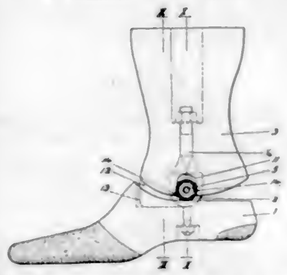
15 Claims. (Cl. 230—175)



1. In a device of the character described, a cylinder mounted for orbital movement, said cylinder having its longitudinal axis parallel to the axis of the orbit, a piston reciprocable in said cylinder, means to actuate said piston and move said cylinder, and outlet and inlet ports to said cylinder operative in response to the movement of said cylinder.

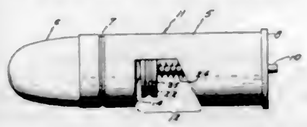
2,098,066
TREATING APPARATUS

Walter W. Sibson, Jr., Philadelphia, Pa., assignor to The Philadelphia Drying Machinery Company, Philadelphia, Pa., a corporation of Pennsylvania



Application August 19, 1935, Serial No. 36,818

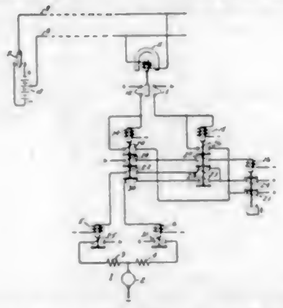
4 Claims. (Cl. 68—18)



1. Treating apparatus comprising a casing adapted to contain treating liquid; a rotary drum in said casing having a foraminous peripheral wall pervious to the liquid; foraminous partitions forming hollow foraminous-walled septa in said drum, with intervening work pockets between said septa, and with direct passage for the liquid through said septa from pocket to pocket; and means for passing air or gas through said casing and said work pockets of said drum, via said hollow foraminous-walled septa and the peripheral wall openings of the drum, said means including conduit means for air communicating with the interiors of said hollow septa.

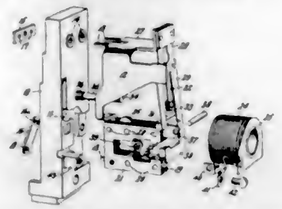
2,098,067
ARTIFICIAL FOOT, JOINT, AND ANKLE
Ludvig Hjalmar Simonsson, Stockholm, Sweden
Application May 28, 1935, Serial No. 23,833
In Great Britain July 4, 1934
3 Claims. (Cl. 3—6)

1. An artificial foot, joint and ankle provided with a ball bearing device placed between the foot and the lower end of the leg, the ball bearing having an outer ring with a spherically shaped outer ball race and an inner ring with an inner ball race, characterized thereby, that the inner ball race ring is secured to a bolt extending into and being secured in two supporting sleeves, which by means of screw bolts are secured to the foot, the outer ball race ring being secured to the lower part of the leg by means of a screw bolt.



2,098,068
TOY CARTRIDGE
William Frank Skinner, Miami, Fla., assignor to John A. Cleveland, Miami, Fla.
Application June 4, 1936, Serial No. 83,559
5 Claims. (Cl. 102—12)

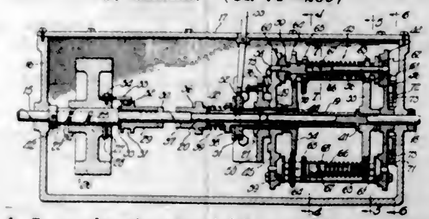
1. Toy cartridge for pistols, comprising a shell, a hammer within said shell having a stem extending through one end thereof adapted to cooperate with the firing mechanism of a pistol, means normally occluding the opposite end of said shell including a valve closed bore, a cap receiving plate within said shell adjacent said hammer and perforated so as to communicate with said bore forming with said hammer a space for receiving the cap, said shell being open laterally at an intermediate point to give access to said cap receiving space for removing a spent cap and replacing with a fresh one.



2,098,069
REMOTE CONTROL SYSTEM
Clyde E. Stewart, Upper Darby, Pa., assignor to General Electric Company, a corporation of New York
Application September 10, 1936, Serial No. 100,152
6 Claims. (Cl. 172—239)

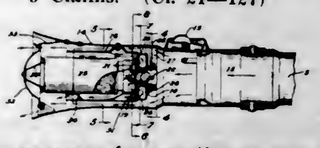
6. In combination, a conductor, two relays, a device movable in different directions, means for selectively controlling over said conductor the energization of said relays, and means controlled by said relays for effecting the movement of said device in one direction when one of said relays is energized and the other relay is de-energized and for effecting the stopping of said device when both of said relays are simultaneously energized and de-energized and for effecting the movement

of said device in another direction when said one of said relays is de-energized and the other relay is energized.



2,098,070
ELECTROMAGNETIC RELAY
Allen G. Stimson, Niskayuna, N. Y., assignor to General Electric Company, a corporation of New York
Application May 29, 1935, Serial No. 23,999
8 Claims. (Cl. 175—338)

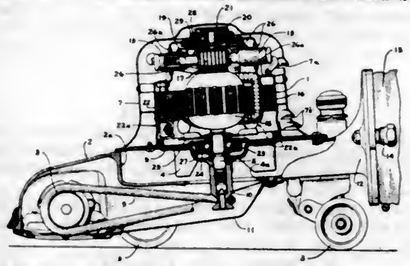
1. An alternating-current relay comprising a magnetizable frame having an air gap, a magnetizable armature, a cantilever spring secured to said armature for normally supporting said armature in a position adjacent said frame, said armature and said cantilever spring having a natural amplitude of vibration about said normal position when said armature is moved from said position to stress said spring and then released, means including an operating winding for producing a magnetic flux in said frame to attract said armature from said normal position to a position within said air gap, means including a short-circuited winding carried by said armature for damping forced vibration of said armature within said air gap, and a stop for preventing free vibration of said armature about said normal position when said armature is released from said air gap, said stop being positioned beyond said normal position but within the natural vibration range of said armature.



7. An alternating-current relay comprising a laminated magnetic frame having a plurality of substantially rectangular poles, an inner lamination of said frame having a portion extending outwardly from a side of one of said poles, an operating coil for said relay comprising a spool of insulating material surrounding said one pole, the dimensions of said extending portion being such that when said coil is pressed onto said pole, said spool is forced into intimate engagement with said extending portion and with the remote corners of said rectangular pole whereby a rigid three-point support for said coil is provided.

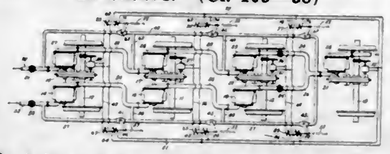
2,098,071
MOTOR VEHICLE DRIVE
Giuseppe Tasso, Brooklyn, N. Y., assignor of one-half to Irving L. Rollins, Brooklyn, N. Y.
Application October 6, 1936, Serial No. 104,158
10 Claims. (Cl. 74—259)

1. In a planetary variable speed transmission, a power driving shaft, a driven propeller shaft axially alined with said power driving shaft, a rotor frame journaled for rotation on said driving and driven shafts, a driving sun gear fixed to said power driving shaft, a driven sun gear keyed to said driven propeller shaft, one or more planet shafts carried by said rotor frame, each of said planet shafts comprising a pair of shaft sections slidably keyed together, the outer ends of said shaft sections having their outer ends slidably supported in said rotor frame, planet gears mounted on the respective shaft sections in mesh with the respective sun gears, releasable means normally locking said shaft sections against rotation to cause said rotor to rotate with said power driving gear and impart a direct drive from said driving shaft to said driven propeller shaft, means preventing retrograde movement of said rotor frame, and means operable upon a predetermined magnitude drag upon said propeller shaft for actuating said releasable means to free said shaft sections from locking engagement with said rotor frame to cause a reduced speed to be transmitted from said power driving shaft to said driven propeller shaft through the meshing sun and planet gears.



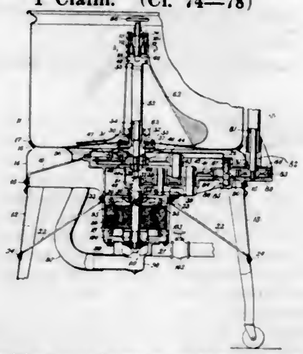
2,098,072
SUCTION CLEANER
Charles H. Taylor, North Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application January 2, 1935, Serial No. 185
5 Claims. (Cl. 21—127)

2. In an accessory for a suction cleaner, a hollow body open at its ends, a receptacle for a volatile element having a single open end, means removably seating said receptacle in said body, valve means to direct a part only of an air stream passing through said body into and from said receptacle or to seal said receptacle completely from said air.



2,098,073
ELECTRIC MOTOR
Wilmer H. Tucker, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio
Application December 11, 1936, Serial No. 115,322
5 Claims. (Cl. 171—324)

1. An electric motor comprising a frame, an armature shaft having bearings at the opposite ends of said frame and including a commutator adjacent one end thereof, commutator brush holders disposed radially with respect to said commutator, a supporting member for said brush



holders embracing the bearing at the commutator end of the armature shaft, and a resilient member between said supporting member and the motor frame.

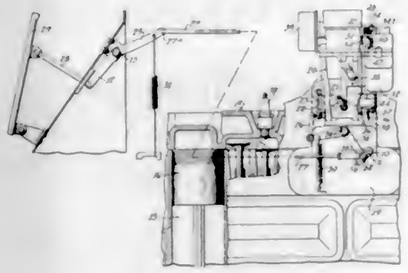
2,098,074
LOCOMOTIVE TURBINE DRIVE
Glenn B. Warren, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application September 21, 1935, Serial No. 41,625
14 Claims. (Cl. 105—38)

13. A locomotive drive arrangement including the combination of a first axle means, a second axle means, means including a high pressure high speed elastic fluid turbine and a high pressure low speed elastic fluid turbine for driving the first axle means, means including a low pressure high speed elastic fluid turbine and a low pressure low speed elastic fluid turbine for driving the second axle means, a crossover conduit connecting the high speed turbines in series, and another crossover conduit connecting the low speed turbines in series.

2,098,075
WASHING MACHINE
Noble H. Watts, Bridgeport, Conn., assignor to General Electric Company, a corporation of New York
Application May 29, 1934, Serial No. 728,125
1 Claim. (Cl. 74—78)

In a washing machine, a rotary driving shaft, an oscillatory driven shaft, means including a

rack and pinion connecting said shafts for oscillating said driven shaft, said shafts being arranged in vertical alignment with an end of said driving shaft bearing against an end of said driven shaft to provide a thrust bearing for said shafts.



2,098,076

CLUTCH CONTROL

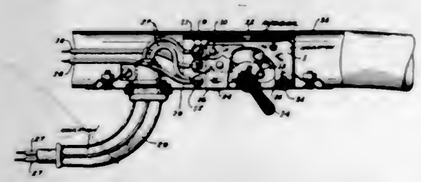
Ralph H. Whisler, St. Clair Shores, Mich., assignor, by mesne assignments, to Carter Carburetor Corporation, St. Louis, Mo., a corporation of Delaware

Original application October 13, 1934, Serial No. 748,197. Divided and this application December 29, 1936, Serial No. 118,053

8 Claims. (Cl. 192—.01)

1. In combination, a carburetor having a throttle valve, a vacuum controlled device for actuating a clutch, mechanism for controlling said device, joint control means for said valve and said mechanism, and means whereby the last part of the closing movement of said throttle valve is effected independently of said control mechanism after completion of the movement of said joint control means in a direction to close said throttle valve.

2,098,077



ELECTRIC SWITCH

Harry B. White, Canton, Ohio, assignor to The Hoover Company, North Canton, Ohio, a corporation of Ohio

Application August 8, 1934, Serial No. 738,918

Renewed September 2, 1936

4 Claims. (Cl. 200—67)

3. In an electric switch, an insulating body formed with a centrally located cavity open on one side, a lever pivoted to said body, a flying contact and a spring connecting said contact to said lever, all positioned in said cavity with said lever extending therefrom, said body formed as a guideway for said flying contact on one side of said cavity, an insulating sheath enclosing two sides and one edge of said body and overlying said cavity, means securing said sheath to said body, conductor receiving terminals carried by said body and covered by said sheath, said sheath being deformable to uncover said terminals.

2,098,078

FRICTION MATERIAL

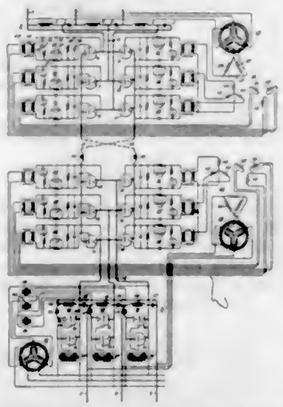
William L. White, Clifton, N. J., assignor to Raybestos-Manhattan, Inc., Passaic, N. J., a corporation of New Jersey

No Drawing. Application October 7, 1933, Serial No. 692,619

4 Claims. (Cl. 106—7.5)

1. Friction material, comprising a hard, dense mass of asbestos fibers and an organic binder cured to provide the desired coefficient of friction, having distributed therethrough a relatively small amount of finely divided particles of vulcanized soft rubber having the property of melting to lubricate the working surface of said friction material at relatively high temperatures and of such a character that they will not melt to lubricate the working surface of said friction material at relatively low temperatures.

2,098,079



ELECTRIC POWER TRANSMISSION SYSTEM

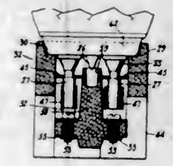
Clodius H. Willis, Princeton, N. J., Frank R. Elder and Burnice D. Bedford, Schenectady, N. Y., assignors to General Electric Company, a corporation of New York

Application March 24, 1936, Serial No. 70,575

Renewed June 23, 1937

34 Claims. (Cl. 171—97)

26. In combination, a constant voltage alternating current supply circuit, a constant voltage alternating current load circuit, means associated with said supply circuit for transforming said constant voltage alternating current to direct current of constant value comprising a network of reactances of opposite sign and electronic discharge means, means associated with said load circuit for transforming direct current of constant value to alternating current of constant voltage comprising a network of reactances of opposite sign and electronic discharge means, and means associated with said first-mentioned network for controlling the effective value of the reactances having corresponding sign comprising a plurality of auxiliary circuits each associated with a different one of said reactances of corresponding sign to effect control of the quantity and direction of energy transfer between said supply circuit and said load circuit.



2,098,080

INCANDESCENT LAMP AND THE LIKE

Daniel K. Wright, Cleveland Heights, Ohio, assignor to General Electric Company, a corporation of New York

Application January 2, 1936, Serial No. 57,196

25 Claims. (Cl. 176—32)

25. An electrical device comprising an envelope having a comparatively heavy preformed glass portion with a plurality of projecting bosses thereon and a hole through each of said bosses and said preformed glass portion; a plurality of rigid metal contact prongs extending through said holes and provided with surrounding flared skirts having their edges sunk and fused into the thickness of said preformed glass portion and around said bosses; and a light source in said envelope supported by and electrically connected to said prongs.

2,098,081

ALUMINUM ALLOY

John Bartow Bates, Euclid, Ohio, assignor to Titanite Alloys Corporation, Euclid, Ohio, a corporation of Ohio

No Drawing. Application March 10, 1936, Serial No. 68,086

2 Claims. (Cl. 75—142)

1. A casting alloy consisting of 0.5 to 5.0% of manganese, 0.05 to 0.5% of titanium, 0.5 to 8.0% of copper, 0.1 to 4.9% of magnesium, 0.1 to 4.9% of silicon, the aggregate amount of the magnesium and silicon free and combined as magnesium silicide being limited to 5% of the alloy, and the balance commercial aluminum having impurities not in excess of 1.0%.

2,098,082

REACTION PRODUCT OF CELLULOSIC MATERIAL

Albert Henry Bowen and Theodore Williams Dike, Seattle, Wash., assignors to I. F. Laucks, Inc., Seattle, Wash., a corporation of Washington

No Drawing. Application November 19, 1934, Serial No. 753,648

6 Claims. (Cl. 91—68)

1. An article of manufacture, comprising cellulosic materials and reacted zinc chloride, urea and formaldehyde.

2,098,083

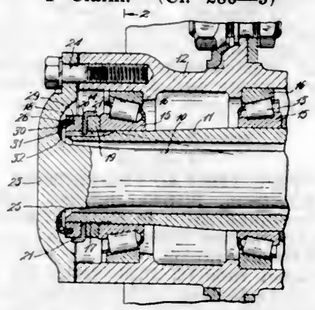
SYNTHETIC RESIN ADHESIVE

Albert Henry Bowen and Theodore Williams Dike, Seattle, Wash., assignors to I. F. Laucks, Inc., Seattle, Wash., a corporation of Washington

No Drawing. Application November 21, 1934, Serial No. 754,178

20 Claims. (Cl. 91—68)

1. A composition embodying a zinc chloride-urea-formaldehyde condensation product and a sizing adhesive agent from the group consisting of animal glue, casein, starch and gum arabic.



2,098,084

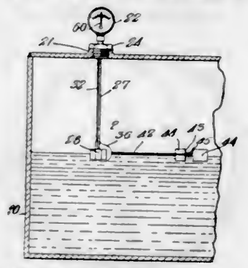
SEALING DEVICE AND ASSEMBLY

Gustav W. Carlson, Cleveland Heights, Ohio, assignor to Eaton Manufacturing Company, Cleveland, Ohio, a corporation of Ohio

Application January 31, 1936, Serial No. 61,782

1 Claim. (Cl. 286—5)

In combination, a tubular member, a rotatable shaft projecting from said member, a substantially radially extending flange on said shaft adjacent the end of said tubular member and presenting a dished face toward the latter, a nut on the tubular member adjacent the end thereof and having an annular groove in its outer end face and lying between the inner and outer peripheries of the nut, and a flexible lubricant retaining packing member having a ring portion engaging in said groove for supporting such packing member and locating the same with respect to the rotation axis and an annular flange portion connected with said ring portion and extending substantially radially inward therefrom, the outer face of said flange portion engaging the dished face of said flange and being sealingly pressed thereagainst by the flexibility of the packing member.



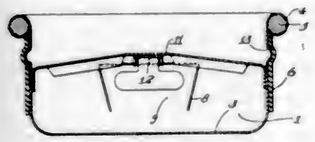
2,098,085

LIQUID LEVEL INDICATOR

John D'Arcey, Chelsea, Mass.

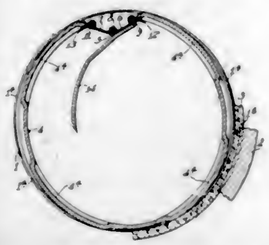
Application September 18, 1934, Serial No. 744,515

10 Claims. (Cl. 73—317)



1. Means for indicating the level of liquid in a receptacle comprising a plug mounted in an opening in the receptacle, a saddle in said receptacle suspended from said plug, a pin carried by said saddle, a rotatable disk eccentrically mounted on said pin, an arm extending from said disk, a float on said arm, said float being raised or lowered by changes in the level of the liquid thereby rotating said disk, a block having a pocket in which said disk is mounted and which is raised and lowered by the rotation thereof, a rod having a vertical movement of translation carried by said plug, a gauge operated by the movement of said rod, and means for imparting the movement of the block to the rod.

2,098,086
PHOTOGRAPHIC DESENSITIZER
Walter Dieterle, Dessau-Ziebigk, Germany, assignor to Agfa Ansco Corporation, Binghamton, N. Y., a corporation of New York
No Drawing. Application July 16, 1936, Serial No. 90,891. In Germany July 25, 1935
4 Claims. (Cl. 95—88)

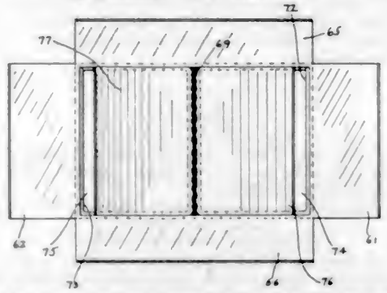


1. A photographic desensitizing solution which comprises an aqueous solution of a water-soluble compound selected from the group consisting of an anthraquinone and a phenanthrenequinone, and at least 2 per cent of sodium sulfite.

2,098,087
PIPE THREAD PROTECTOR
Birger Engstrom, Pittsburgh, Pa., assignor of sixty one-hundredths to Spang, Chalfant and Co., Incorporated, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 18, 1936, Serial No. 85,936
11 Claims. (Cl. 138—96)

1. A thread protector comprising a sleeve of metal or other suitable material which is adapted to fit closely within a hollow article, a segment cut out of the side wall thereof but attached thereto along at least one edge, and means for positively displacing said segment into an out of clamping engagement with the wall of the receiving article.

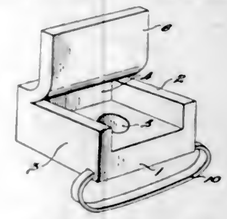
2,098,088
INSIDE PIPE THREAD PROTECTOR
Birger Engstrom, Pittsburgh, Pa., assignor of sixty one-hundredths to Spang, Chalfant and Co., Incorporated, Pittsburgh, Pa., a corporation of Pennsylvania
Application February 17, 1937, Serial No. 126,182
7 Claims. (Cl. 138—96)



1. A thread protector comprising a sleeve provided with a packing liner on its periphery adapted to fit within a hollow article with said liner engaging the inner surface of the article, a split expansible clamping band provided with circumferentially spaced outset portions fitted within said sleeve with said outset portions operative through the sleeve over appreciable areas when said band is expanded and contracted for securing the protector to the protected article and releasing it therefrom, and means connected to the end of the clamping band for expanding and contracting it.

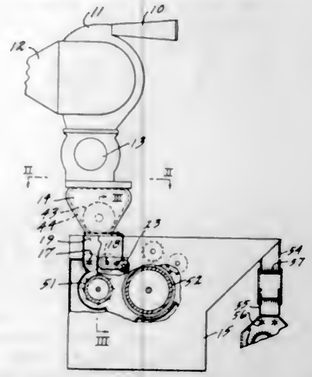
2,098,089
PRODUCTION OF CHLORBUTADIENE
Ernst Eberhardt, Ludwigshafen-on-the-Rhine, and Robert Stadler, Heidelberg, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application April 18, 1936, Serial No. 75,236. In Germany April 27, 1935
5 Claims. (Cl. 260—166)

1. A process of producing chlorbutadiene from gases containing vinyl acetylene which comprises leading the said gases together with the corresponding amount of hydrogen chloride at elevated temperature over active carbon in the presence of a halide of a metal selected from the group consisting of base metals of the second and fourth groups of the periodic system of the elements.



2,098,090
SHIPPING CONTAINER FOR HANDLING GOODS
Robert E. Ford, Minneapolis, Minn., assignor to Luther Ford & Company, Minneapolis, Minn., a co-partnership composed of Allyn K. Ford and Robert E. Ford
Application January 18, 1935, Serial No. 2,360
3 Claims. (Cl. 229—15)

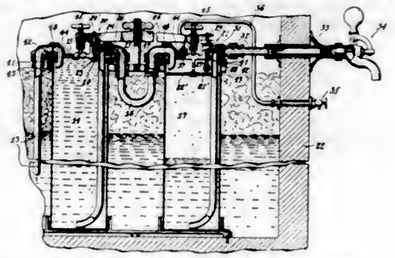
1. A shipping container adapted to be separated into a pair of independent containers, comprising a main casing adapted to hold a maximum number of articles to be shipped, a pair of partitions adjacent one another in said casing with contacting plane-surfaced walls and having integral extensions glued to the bottom of the main casing, and having right-angled extensions at their tops, flaps on two opposite sides of the main casing adapted to be folded over and upon said latter extensions and glued thereto, flaps on the other two sides of the main casing glued to the top of said first-named flaps, the closely adjacent edges of said last-named flaps coming in the separation plane of said partitions, whereby the walls of the casing may be severed in said separation plane to produce two independent containers each embodying plane-surfaced walls on all sides and being in condition for shipping without wrapping or other protective addition.



2,098,091
BATTERY TERMINAL PROTECTOR
John F. Gamble, Detroit, Mich.
Application February 24, 1936, Serial No. 65,240
4 Claims. (Cl. 173—259)

1. A protector for a battery terminal and battery terminal clamp comprising an absorbent member saturated with corrosion resistant material, said member being arranged to be fitted about the battery terminal and being provided with a chamber therein for the battery terminal clamp, said chamber being arranged to be filled with corrosion resistant material, a cover for said chamber of absorbent material saturated with corrosion resistant material and an elastic band

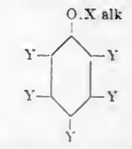
fitted about the said member and compressing the same to prevent leakage of corrosion resistant material from the chamber.



2,098,092
FEED MECHANISM FOR COTTON HULLERS AND CLEANERS
Clyde E. Hagler, Birmingham, Ala., assignor to Continental Gin Company, a corporation of Delaware
Application September 4, 1934, Serial No. 742,564
15 Claims. (Cl. 19—69)

1. The combination with a distributor for the gins and a pneumatic conveyor system for supplying seed cotton thereto, of a preliminary cleaner mechanism interposed between said conveyor system and distributor and comprising feed rolls having a variable-speed drive, a means to deliver seed cotton from said conveyor system to said feed rolls, and means responsive to the presence of an excess of seed cotton in said delivery means to accelerate the rate of drive for said feed rolls.

2,098,093
LIQUID DISPENSING APPARATUS
Edward G. Hedges, Newark, and Robert Stickles, Union, N. J.
Application February 24, 1936, Serial No. 65,284
10 Claims. (Cl. 225—1)



8. A system closed to the atmosphere for dispensing charged liquids, comprising in combination, a plurality of tanks and a source of liquid supply, means for maintaining pressure upon said liquid in said source, means for connecting one of said tanks to said source, means for dispensing liquid from another of said tanks, means interconnecting said tanks in serial relation for the passage of liquid from one tank to another, and means communicating with said last mentioned means to pass gases accumulating above

the level of the liquid in one tank into said communicating means.

2,098,094
WATER-SOLUBLE ORGANIC IODINE COMPOUNDS
William Hiemenz and Louis Freedman, Albany, N. Y., assignors to Winthrop Chemical Company, Inc., New York, N. Y., a corporation of New York
No Drawing. Application May 29, 1936, Serial No. 82,527
3 Claims. (Cl. 260—108)

1. Water-soluble salts of iodo-phenoxy aliphatic sulfonic acid compounds of the general formula:

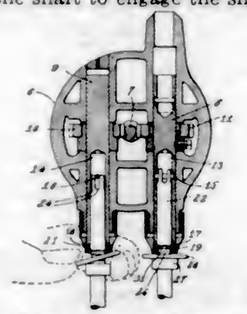
in which X represents a member of the group consisting of CH_2COO—, $(CH_2)_2COO$— and $(CH_2)_3COO$—, one Y represents —SO_3 alk, at least one Y represents I, and the remaining Y's represent a member of the group consisting of —H and —I, and alk represents a basic radical capable of producing water-soluble salts.

2,098,095
FISH LURE
Edwin L. Hoefler, Detroit, Mich.
Application June 19, 1935, Serial No. 27,358
6 Claims. (Cl. 43—42)

1. In a fish lure, a hook, a leader attached to said hook, and a body positioned about said hook,

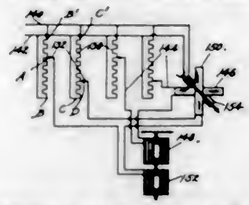
comprising a coil of relatively fine wire with the adjacent loops closely juxtaposed and of such contour as to simulate a natural bait, said body being readily collapsible by lateral pressure.

2,098,096
CIGARETTE PACKAGE
John H. Hollis, Lincoln, Mass.
Application October 25, 1935, Serial No. 46,766
3 Claims. (Cl. 206—48)



1. A match unit for a cigarette package, the unit comprising matches arranged in inner and outer strips, a mounting for the same consisting of a cardboard backing having a short up-turned lower end forming a striker strip, and a down-turned upper end for normally covering the matches, a staple passing through the inner strip of matches and the backing, a second staple passing through the striker strip, outer strip of matches, and backing, and an attachment band of flexible transparent material extending transversely across and beyond the front face of the backing and under the match strips and penetrated by the staples, the ends of the band being adapted to be secured around a cigarette package to attach the unit to the package.

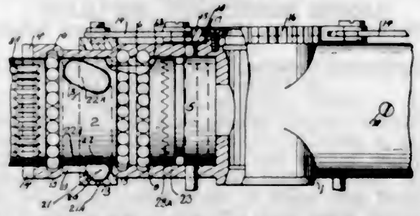
2,098,097
CONDENSATION PRODUCTS OF 1,2,3,4-BUTYLENE-DIOXIDES AND A PROCESS OF MAKING SAME
Heinrich Hopff and August Weickmann, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application December 18, 1935, Serial No. 55,041. In Germany December 20, 1934
13 Claims. (Cl. 260—60)



1. The process for the production of condensation products which consists in reacting butylene 1,2,3,4-dioxides with organic compounds containing at least one reactive hydrogen atom selected from the group consisting of aromatic and N-heterocyclic compounds containing a substituent of the group consisting of the amino and hydroxy group which compounds are free from sulphonic acid groups.

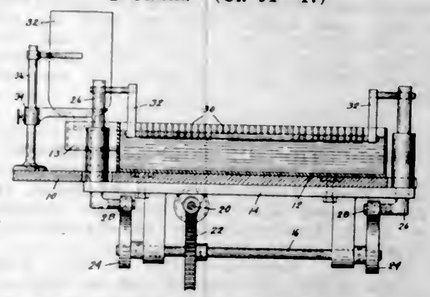
2,098,098
FOOD MIXER
Ivar Jepson, Chicago, Ill., assignor to Chicago Flexible Shaft Company, Chicago, Ill., a corporation of Illinois
Application September 14, 1936, Serial No. 100,649
7 Claims. (Cl. 259—1)

1. The combination in a household mixer, of a casing, a driven spindle carried on the casing, a beater having a shaft receivable in said spindle, spring means acting between the spindle and the shaft to hold the shaft in an operative driving position, a lever loosely carried on the shaft and wholly supported thereon arranged for manual tilting on the shaft to engage the shaft and another part of the mixer and thereby move the shaft longitudinally to release the beater from the spindle.



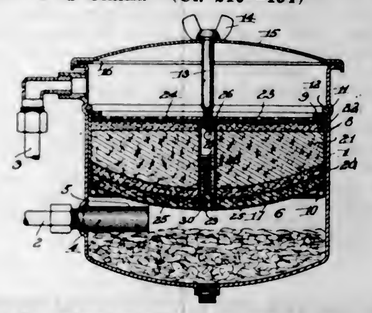
2,098,099
WIND PRESSURE GAUGE
Frank Kahn, Philadelphia, Pa.
Application July 30, 1932, Serial No. 626,519
9 Claims. (Cl. 177—351)

1. In a system for the remote indicating of the movement of a body movable substantially in a plane, four slide-wire rheostats in space-quadrature about the field of movement of said body, rods pivotably connecting the sliders of said rheostats to said body, a source of electric current, a goniometer having two fixed coils in quadrature and a rotatable coil, and a two-element dynamometer ammeter, the rheostats being arranged in circuit with said source as potentiometers with the difference of potential between the sliders of each aligned pair of rheostats, respectively, forcing current through one fixed coil of the goniometer and one element of the dynamometer ammeter in series, respectively, the rotatable goniometer coil being separately energized from the electric source.



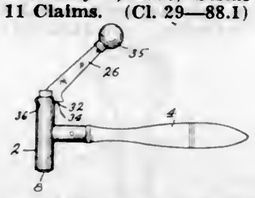
2,098,100
PROPELLER
Lawrence Kaiser, Milwaukee, Wis.
Application November 13, 1933, Serial No. 698,026
2 Claims. (Cl. 170—162)

1. In a propeller the combination of a hub, hollow members projecting therefrom, a propeller



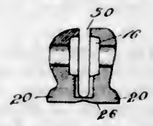
blade rotatably mounted in each of said members, a ring encircling each of said members and movable axially thereof, a slot in each of said members, a non-parallel groove in each of said blades, and a ball engaged in said slot and groove and movable with said ring to rotate the associated blade.

2,098,101
CEMENTING MACHINE
Irving L. Keith, Haverhill, Mass.
Application August 21, 1936, Serial No. 97,128
1 Claim. (Cl. 91—47)



In combination with a liquid adhesive containing receptacle, a horizontally disposed grid composed of suitably spaced bars of substantial width vertically and having faces on their top edges adapted to carry adhesive, and means for raising and lowering said grid within said receptacle and for so limiting the vertical movements thereof with relation to the liquid level in the receptacle that the grid is moved between a position in which it is completely submerged, so that adhesive is applied to said faces, and a position in which the lower edges of the bars are still submerged and the upper edges thereof are raised above the liquid level, to permit the work to be laid thereon and adhesive on said faces to be applied thereto.

2,098,102
OIL FILTER
William A. McLean, Rochester, N. Y., assignor to C. Schnackel's Son, Inc., Rochester, N. Y., a corporation of New York
Application June 26, 1933, Serial No. 677,647
1 Claim. (Cl. 210—134)

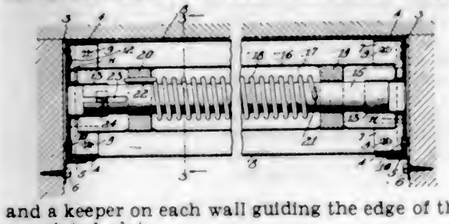


In a force feed oil filter, the combination with a tank having a discharge connection and an intake connection and provided with a recessed seat in its inner wall, of a detachable spring ring of circular cross section held to the seat in the tank wall by its own expansive force and itself forming a seat on the interior of the tank, a light cartridge adapted to act as a unitary, perishable and replaceable filtering element detachably arranged between the connections, the same comprising an inner compacted filtering medium and a cylindrical paper casing permanently enclosing the same and having its ends crimped inwardly over the filtering medium at the ends of the cylinder in the manner of a shotgun shell, the crimped end of the cartridge being forced against the said ring seat by the pressure of oil from the intake connection in a manner tending to tighten the crimping.

2,098,103
WATCHMAKER'S TOOL
Joseph H. Meinhardt and Samuel M. Coffman, Kansas City, Mo.; said Coffman assignor of one-fourth to said Meinhardt
Application January 2, 1936, Serial No. 57,240
11 Claims. (Cl. 29—88.1)

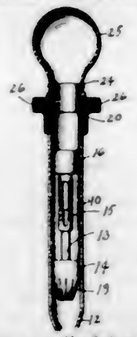
1. A device of the character described comprising a tubular member, a hollow plunger reciprocably mounted in said tubular member and provided with an internally beveled portion, a chuck reciprocably mounted within said plunger and provided with resilient jaws adapted to be closed when forced to slide upon said beveled portion, a spring adapted when compressed sufficiently to exert enough pressure on said chuck to slide the jaws upon the beveled portion, and means for compressing said spring.

2,098,104
JEWELRY FINDING
Eugene Morehouse, Providence, R. I., assignor to B. A. Ballou & Co., Inc., a corporation of Rhode Island
Application October 17, 1935, Serial No. 45,466
4 Claims. (Cl. 29—160.6)



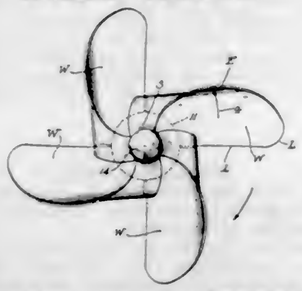
1. A jewelry finding for a pin stem joint or catch comprising a piece of stock folded once to provide parallel ears with integral flanges extending from said fold at substantially right angles to said ears and lying alongside said ears to provide a base the under surface of which presents a solder surface for attachment of the device.

2,098,105
ROLLER SCREEN
Alvin F. Nye, Rochester, N. Y., assignor to Fil-Bac Products Corporation, Rochester, N. Y., a corporation of New York
Application March 19, 1935, Serial No. 11,828
3 Claims. (Cl. 156—39)



3. In a roll screen mounting, the combination with an elongated casing having a longitudinally extending screen slot therein at one side and end walls, of a supporting plate carrying a trunnion

pivoted on each end of and inside the casing to throw the trunnions toward and from the slot,

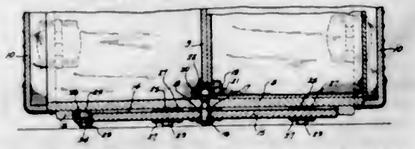


and a keeper on each wall guiding the edge of the associated plate.

2,098,106
SYRINGE
Carl Edward Pieck, Covington, Ky.
Application July 16, 1935, Serial No. 31,645
10 Claims. (Cl. 128—234)

1. In a syringe, a cylindrical barrel, a tapered constriction at the lower end thereof, a rigid socket at the upper end thereof, air inlet means in said socket, a soft pneumatic bulb attached to said socket and in pneumatic communication with the interior of said barrel, a compound piston wholly within said barrel and screw means for adjusting the length of said piston, all of the parts of said piston being arranged to travel in unison during use.

2,098,107
FAN WITH RUBBER BLADES
Edward S. Preston, Chicago, Ill., assignor to Chicago Electric Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application August 22, 1936, Serial No. 97,318
17 Claims. (Cl. 230—261)

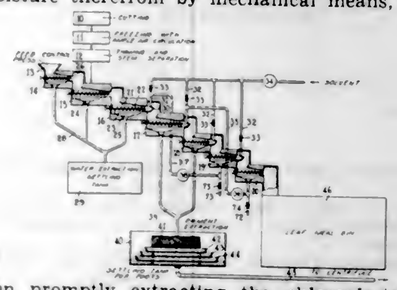


1. A pin-wheel type rubber-bladed fan member comprising a centrally perforated sheet of flexible rubber having slits extending radially into it to define counterpart wings presenting straight forward edges, and curved trailing edges terminating in wing-securing straps, and having each wing provided with a perforation disposed near the outer end of its rotationally rearward edge portion, the said wings being all bent forwardly and thereafter radially inwardly to dispose their said end portions in relatively overlapping relation and to have the said wing perforations aline with the central perforation in the said sheet; a stem extending forwardly through all of the said perforations; a spacer sleeved upon and centered by the stem member and disposed between the said sheet and the said overlapped wing portions; and means associated with the said stem member conjointly clamping the said wing portions, the spacer and the central sheet portion rearwardly against a portion of the stem member.

2,098,108
PRODUCTION OF POLYMERIZATION PRODUCTS OF VINYL ETHERS
Walter Reppe, Ludwigshafen-on-the-Rhine, and Erich Kuehn, Mannheim, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany
No Drawing. Application July 19, 1935, Serial No. 32,276. In Germany July 26, 1934
11 Claims. (Cl. 260—2)

6. The process of producing polyvinyl ethers which comprises treating a vinyl ether with sulphur dioxide together with a small amount of an inorganic, practically anhydrous acid reacting substance.

9. Polymerized glycerol formaldehyde acetal vinyl ether.

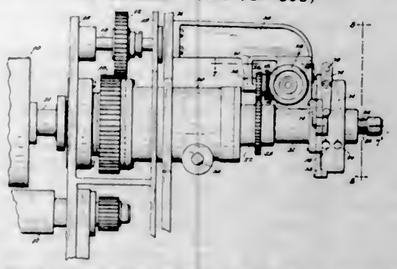


2,098,109
REVOLVING TRUNK
Julius Ritter, Jr., Racine, Wis., assignor to Hartmann Trunk Company, Racine, Wis., a corporation of Wisconsin
Application March 23, 1936, Serial No. 70,230
1 Claim. (Cl. 248—129)

In a rotatable trunk having a rigid, integral bottom member, a base plate below said bottom member, said base plate being formed, inwardly of the surface adjacent the bottom, with a plurality of spaced, individual recesses, bearing brackets extending into said recesses, roller bearings journaled in said brackets within said recesses and coacting directly with a surface of said bottom, a supporting foot depending from the under side of the plate below each recess, common means for securing each bracket and foot thereadjacent directly to said plate, and a pivot bolt directly connecting said plate and said trunk bottom member.

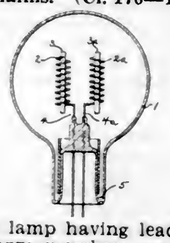
2,098,110
PROCESS FOR EXTRACTING CHLOROPLAST PIGMENTS
Frank M. Scherts and Robert H. Van Sant, Washington, D. C.
Application December 29, 1933, Serial No. 704,572
4 Claims. (Cl. 87—28)

2. The method of extracting chloroplast pigments which includes freezing fresh vegetable matter containing chloroplast pigments to a temperature of not above —10 degrees centigrade, thawing the same, promptly removing excess moisture therefrom by mechanical means, and



then promptly extracting the chloroplasts by repeatedly applying and expressing a liquid chloroplast solvent.

2,098,111
PROCESS FOR TREATMENT OF VEGETABLE FIBER
James S. Sconce, Niagara Falls, N. Y., assignor to Hooker Electrochemical Company, New York, N. Y., a corporation of New York
No Drawing. Application May 4, 1935, Serial No. 19,850
15 Claims. (Cl. 8—2)

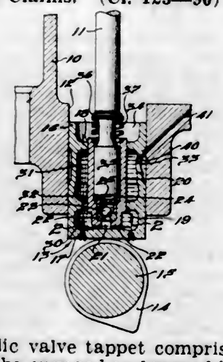


1. The treatment of vegetable fiber pulp which comprises subjecting it while in aqueous suspension to the action of chlorine in amount substantially in excess of that required for complete chlorination of the non-cellulosic constituents of the pulp, allowing the chlorine to react with the pulp to a point substantially short of complete exhaustion of the chlorine, adding lime to the pulp in amount sufficient to neutralize the acids formed, combine with the excess chlorine to form a hypochlorite and produce a pH in the suspension of not less than 8, allowing the hypochlorite to react with the pulp, washing the pulp, leaching the pulp with not less than one per cent of its weight of caustic soda and washing the pulp again.

2,098,112
RUNNING REGISTER
Frank S. Shields, Jamaica, N. Y., assignor to S. & S. Corrugated Paper Machinery Co., Inc., Brooklyn, N. Y., a corporation of New York
Application April 22, 1936, Serial No. 75,705
15 Claims. (Cl. 74—395)

1. In a running register, a drum; a source of motive power for driving said drum; a positive drive connection from said source of motive power to said drum; means for angularly displacing said drum with respect to said motive power for obtaining adjustments therebetween through 360 degrees; and vernier adjusting means for angularly displacing said drum with respect to said motive power; said first and second means being operative while maintaining said positive drive connection from said source of motive power to said drum.

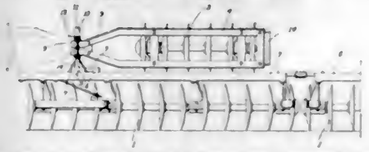
2,098,113
LAMP AND METHOD OF OPERATING SAME
Charles Spaeth, Flushing, N. Y.
Application February 6, 1932, Serial No. 591,305
Renewed February 24, 1936
19 Claims. (Cl. 176—122)



1. An electric lamp having lead-in wires and separated discharge members connected to said lead-in wires, the distance between said discharge members being greater than the distance between said lead-in wires, said discharge members including paramagnetic material.

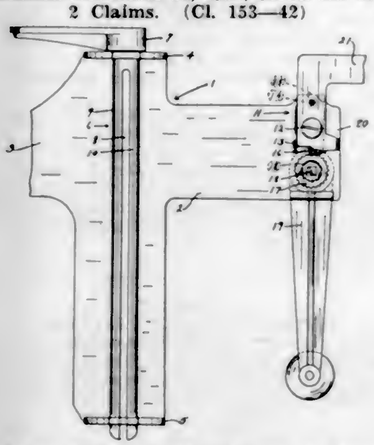
2,098,114
PROCESS FOR SULPHONATING ALCOHOLS
Chester Merle Suter, Evanston, Ill., assignor of twenty-five per cent to The Procter & Gamble Company, Cincinnati, Ohio, a corporation of Ohio
No Drawing. Application October 17, 1935, Serial No. 45,505
7 Claims. (Cl. 260—99.12)

1. The process of making the sulphuric ester of an alcohol which comprises reacting sulphur trioxide with dioxane in the presence of a suitable solvent, and treating said alcohol with said reaction product.



2,098,115
HYDRAULIC VALVE LIFTER
Carl Voorhies, Detroit, Mich., assignor, by mesne assignments, to Eaton Manufacturing Company, Cleveland, Ohio, a corporation of Ohio
Application February 10, 1936, Serial No. 63,187
15 Claims. (Cl. 123—90)

1. A hydraulic valve tappet comprising a casing adapted to be engaged and moved by a tappet operator, a cylinder in said casing, a piston in said cylinder, said cylinder having an inlet port,



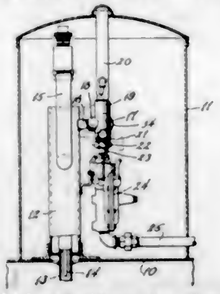
and means positioned within said casing and exteriorly of said cylinder for separating gas from liquid in said casing before it enters said cylinder port.

2,098,116
DISK HARROW
Frederick C. Warne, Mansfield, Ohio, assignor to Farm Tools, Inc., Mansfield, Ohio, a corporation of Indiana
Application September 23, 1936, Serial No. 102,107
10 Claims. (Cl. 55—81)

1. A sectionalized disk harrow comprising a main gang and an extension gang, means mounting the extension gang on the main gang in a manner to allow of the extension gang being first rocked in a vertical plane and then swung in a horizontal plane to a position parallel with and above the main gang, such means being then operable to lay the extension gang in an inverted position upon the main gang.

2,098,117
CAN ROLLER
William F. Warren, Ardmore, Okla.
Application November 13, 1933, Serial No. 697,749
2 Claims. (Cl. 153—42)

1. As an article of manufacture, a device for collapsing cans, comprising a frame adapted to be secured to a wall or table, a pair of integral bearings formed on the frame, aligned vertically, and spaced an equal distance from the main body of the frame; a cylindrical shaft split from its lower end to a point adjacent its upper end journaled in the bearings and adapted to be easily removed therefrom; and a crank rigidly secured to the upper end of said shaft for rotating the shaft.

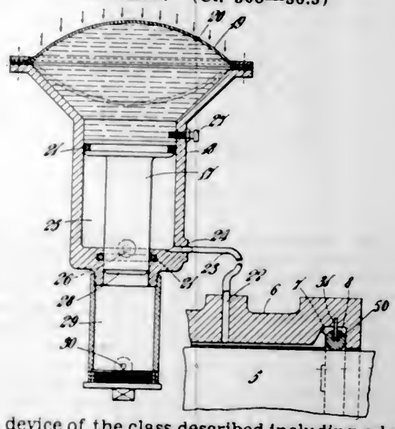


2,098,118
PRINTING UPON POROUS SHEET MATERIAL
John Sylvester Wheelwright, Tonbridge, England, assignor to J. S. Wheelwright Limited, London, England, a British company
Application July 16, 1935, Serial No. 31,674
In Great Britain July 17, 1934
1 Claim. (Cl. 101—426)

A method of printing porous sheet material consisting in uniting a plurality of porous sheets in surface contact with one another by means of gum uniting the lowermost sheet by gum to a non-porous sheet and applying a colour medium

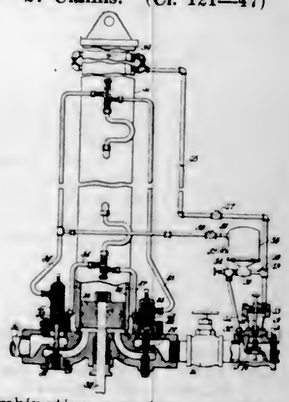
to certain portions of the surface of the top sheet in quantity sufficient to penetrate all the sheets.

2,098,119
COMBINATION FITTING FOR GAS DISPENSING SYSTEMS
Loyd J. White, San Antonio, Tex., assignor to Southern Steel Company, a corporation of Texas
Application October 19, 1936, Serial No. 106,461
5 Claims. (Cl. 137—78)



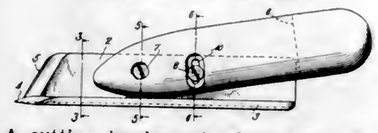
1. In a liquefied petroleum gas dispensing system having a gas conduit communicating with a storage tank, a combination valve fitting and service T having one branch connected to said conduit; a vent branch carrying a safety relief valve discharging to the atmosphere; and a service branch carrying an excess flow check valve.

2,098,120
STABILIZER FOR MOTOR VEHICLES
Elmer E. Williams, Hull, Tex., assignor of thirty-three and one-third per cent to C. A. Pedigo, Hull, Tex.
Application August 1, 1936, Serial No. 93,893
2 Claims. (Cl. 280—90)



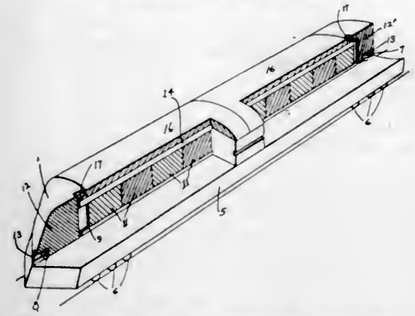
1. A stabilizer comprising a chamber having cylinders projecting from its respective opposite ends, each of said cylinders being provided with an external by-path and ports connecting the respective opposite ends of the by-path with its cylinder adjacent the respective opposite ends of the cylinder, a piston having a sliding fit in each cylinder, said piston having an opening therethrough, a valve controlling said opening, a spring tension device connected with the valve for yieldably seating the valve, a by-path valve associated with the port connecting one end of the by-path with its cylinder, a pair of vertical shafts journaled in said chamber, there being one shaft for each piston, each of said shafts being provided with an arm, and said piston having arms extending therefrom and pivoted at one end to the shaft arm.

2,098,121
BEARING
Cuthbert George Wilkinson, Kuala Sawah, Federated Malay State of Negri Sembilan
Application December 5, 1934, Serial No. 756,155
In Great Britain December 5, 1933
1 Claim. (Cl. 308—36.3)



A device of the class described including a bearing comprising a bushing having a set of leads terminating in a groove and being adapted to communicate lubricant to the bearing surface, a second set of leads communicating with said first mentioned leads and the groove, a pin journaled in the bushing, a resilient ring adapted to fit about said pin, said ring having a recess, means for forcing fluid through the leads to the bearing, said ring being distortable into fluid tight engagement with the pin and the inner wall of the groove by external fluid pressure, and a guide pin carried by the bushing in the groove and engaged in the recess for preventing puckering of the ring.

2,098,122
MOTOR
Wade H. Wineman, Michigan City, Ind., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application January 25, 1934, Serial No. 708,260
27 Claims. (Cl. 121—47)

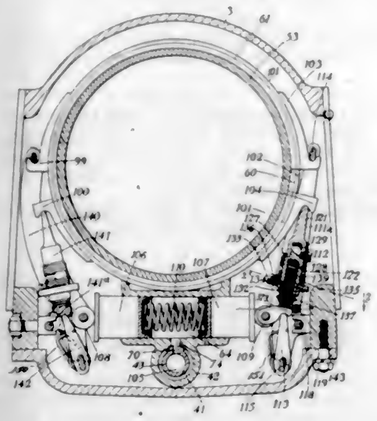


1. In combination, a motor, a supply line therefor, and means for closing said supply line upon predetermined deviation from its normal operating cycle by said motor including a stop valve in said supply line, means operative on supply of operating medium thereto for closing said stop valve, operating medium supply means for said stop valve closing means, pressure fluid controlled controlling means for said operating medium supply means operative when subjected to a predetermined pressure to preclude operating medium supply, and means for periodically supplying pressure fluid to said pressure fluid controlled controlling means during motor operation at a rate varying with the operation of the motor.

2,098,123
DEVICE FOR STRIPPING STRANDULAR MATERIAL FROM CIRCULAR HOLDERS
John T. Wood, West Asheville, N. C., assignor to American Enka Corporation, Enka, N. C., a corporation of Delaware
Application October 1, 1935, Serial No. 43,080
3 Claims. (Cl. 28—19)

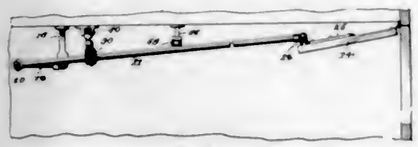
1. A cutting implement adapted for severing wound yarn bodies from their respective circular holders comprising a handle having a T-shaped cutting blade attached thereto, said cutting blade consisting of a base having an arcuate undersurface and a wedge-shaped cutting edge and an articulated upright portion consisting of a rear section in pivotal engagement with a forward section having a cutting edge to coact with said wedge-shaped cutting edge.

2,098,124
BLOCK TOY
William O. Yancey, San Francisco, Calif.
Application June 17, 1936, Serial No. 85,793
2 Claims. (Cl. 46—26)



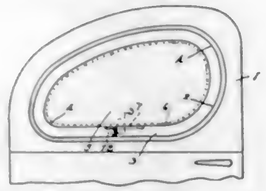
1. In a device of the character described, a base block, studs secured to said base block, end blocks provided with T-slots engaging said studs, a rail secured to said base block, body blocks engaging said rail, and roof blocks superimposed on said body blocks.

2,098,125
BAND-BRAKE ADJUSTING MECHANISM
Joseph Yoxall, Deganwy, North Wales, assignor to Propello Inventions Limited, London, England, a British company
Application April 10, 1935, Serial No. 15,671
In Great Britain June 29, 1934
10 Claims. (Cl. 188—79.5)



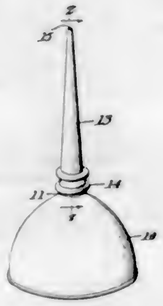
1. Self-adjusting mechanism for taking up wear in band-brakes comprising a drum, a brake-band, members movable to apply said brake-band on said drum, a bipartite member capable

of alteration in length by screwed adjustment of its parts, two axially separated self-lapping coil springs of opposite hand mounted one on each part of said bipartite member and serving,



when the brake-band becomes worn a predetermined amount to produce alteration in length of said bipartite member, upon fully applying and releasing the brake-band.

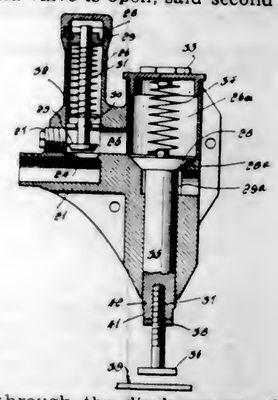
2,098,126
BUS DOOR SAFETY LOCK BAR
Julius E. Zaitz, Hammond, Ind.
Application January 13, 1936, Serial No. 58,978
1 Claim. (Cl. 268—3)



A door actuating device for busses of the class described comprising a pivotally mounted door, an arm pivotally mounted on the interior of said bus for swinging movement in a horizontal plane, a bar having one end pivotally connected to the free end of said arm and the other end pivotally connected to said door whereby upon movement of said bar in one direction the door is moved to closed position and in the other direction to open position, a depending handle on said bar disposed intermediate the ends thereof, a latch box adjacent said bar, a pivotally mounted latch bar in said box, a lever pivotally mounted adjacent said handle for actuating said latch bar, a pair of spaced U-shaped catch members disposed in said bus, said latch bar being cooperable with one or the other of said catch members for maintaining and locking the door in the closed or open position thereof, said catch members cooperable with said latch bar for maintaining the door in closed position, being provided with a hingedly mounted door in its lower position preventing the engagement of the latch bar with said catch members whereby said handle may be moved to a position to close said bus door without the engagement of the latch bar with said catch member.

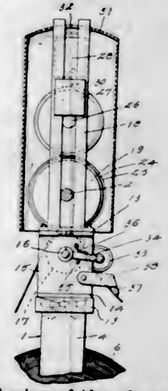
2,098,127
FROST SHIELD
William F. Auger, Winnipeg, Manitoba, Canada
Application June 1, 1937, Serial No. 145,811
In Canada June 15, 1936
2 Claims. (Cl. 20—40.5)

1. The combination with a transparent glass plate having rounded corners, of a continuous, soft rubber, spacing element adhesively attached to one face of the plate and flexing to accommodate the corners of the plate, said element crossing the sides and ends of the plate and having its ends butting and having the exposed face of the element remote from the plate provided with a coating of normally non-adhesive material of a nature to be rendered adhesive by the wiping of the surface thereof with gasoline.



2,098,128
RUBBER OIL CAN SPOUT
Clarence M. Bailey, Baton Rouge, La.
Application September 11, 1936, Serial No. 100,355
1 Claim. (Cl. 221—32)

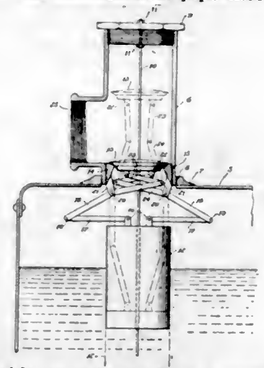
A rubber spout for oil cans, said spout having a rib at one end restricting the flexibility of the spout for clamping the spout upon the ribbed neck of an oil can, and a metal frusto-conical stiff nipple in the bore of the spout at said rib resisting distortion of the spout at the rib and maintaining the spout in unclogged condition by virtue of the tapered shape of the nipple at the neck of the oil can.



2,098,129
LOADED AND LIGHT CAR BRAKE
Wright H. Bell, Oneonta, N. Y.
Application April 1, 1937, Serial No. 134,410
4 Claims. (Cl. 303—22)

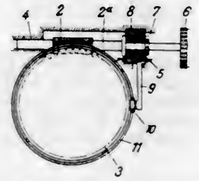
1. In combination with the air line of an air brake system of a vehicle, and a part displaceable according to the weight of a load, a valve operable to open under a predetermined pressure, a second valve, means on the part normally maintaining the second valve open, means providing communication with the atmosphere when the second valve is open, said second valve being

closable through the displacement of said part under the weight of a load.



2,098,130
PAPER ROLL PRINTING ATTACHMENT
Hugh L. Binford, Houston, Tex., and Odie W. Putnam, Selma, Ala.
Refiled for abandoned application Serial No. 661,965, March 21, [illegible]. This application March 30, 1937, Serial No. 133,909
4 Claims. (Cl. 101—226)

1. A printing device of the character described, comprising a pair of brackets, an impression roll rotatably mounted therebetween, a pair of standards disposed in vertical spaced relation upon each bracket and constituting a bearing, a printing roll resting upon the impression roll and having end trunnions positioned in said bearings, an inking roll resting upon the printing roll and having end trunnions positioned in said bearings, an elongated receptacle overlying the inking roll, a wick extending from the interior of the receptacle to and wiping the surface of the inking roll, elements at the end of the receptacle for slidable engagement between the adjacent bearing standards, and means supporting the ends of the receptacle upon the underlying trunnions.

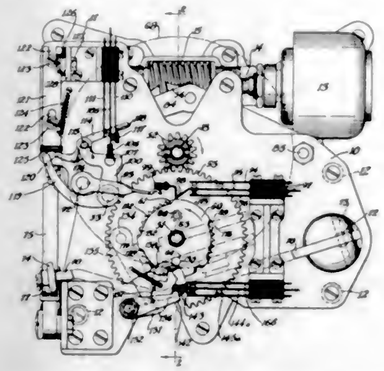


2,098,131
OVERFLOW PREVENTING DEVICE
William Bluhm, New York, N. Y.
Application September 18, 1936, Serial No. 101,505
6 Claims. (Cl. 137—104)

1. In an overflow preventing device, the combination of a body having an inlet pipe therein, a shaft extending through said pipe into said body,

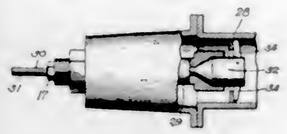
a valve slidable on said shaft, and means within said body for actuating said valve on said shaft.

2,098,132
MECHANISM FOR PRODUCING ACCURATELY PITCHED CUTTING ON CIRCULAR WORK
Erich Büchholz, Berlin, Germany, assignor to Herbert Lindner, Berlin-Wittenau, Germany
Application December 16, 1935, Serial No. 54,780
In Germany January 18, 1935
1 Claim. (Cl. 90—1)



In a device for circumferentially operating upon a work piece, a rotatable table for supporting said work piece, a worm wheel carried by said table, a worm meshing with said worm wheel, a shaft carrying said worm, bearings supporting said shaft for revoluble and longitudinal movement of said shaft, and means carried by said table for longitudinally shifting said shaft in accordance with variations in the pitch of said worm wheel, said means being arranged to correct inaccuracies of the pitch of the worm wheel, said last means including a cam on said work piece support and extending continuously thereabout, journal means for supporting said shaft, means on said shaft for establishing definite longitudinal positional relation between said shaft and said journal means comprising a screw on said shaft and a nut fixed against longitudinal movement and mounted on said screw, and means to vary the longitudinal displacement of the shaft with respect to variations in the pitch of the teeth on the worm wheel, including an arm fixed to said nut and engaging said cam.

2,098,133
AUTOMATIC TELEPHONE ALARM
Ralph W. Carnahan, Shaker Heights, Ohio, assignor of one-fourth to Hyman Seegel and Samuel Seegel, both of Cleveland, Ohio; Adolph E. Emerman, executor of said Ralph W. Carnahan, deceased, assignor of three-fourths to Florence Carnahan, Cleveland Heights, Ohio
Application February 9, 1933, Serial No. 655,985
23 Claims. (Cl. 179—6)

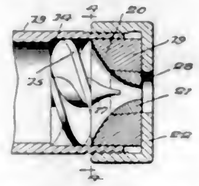


1. In combination with a telephone circuit,

alarm transmitting apparatus including means for automatically delivering a predetermined message over the telephone circuit, an initiating device for automatically starting the operation of said alarm transmitting apparatus by the presence of a person at a given point, and inhibiting

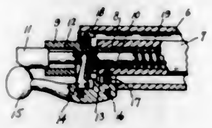
means including a circuit normally open at said given point and a conductor on the shoe of an authorized person for closing said circuit permitting an authorized person to approach said given point without operating said initiating device.

2,098,134
BEARING CUP EXTRACTING TOOL
Bennie Cook, Oklahoma City, Okla., and Edward C. Pfeffer, Corpus Christi, Tex.
Application November 13, 1936, Serial No. 110,754
1 Claim. (Cl. 29—88.2)



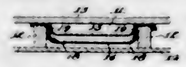
An extractor comprising a housing, a bearing carried by said housing, a hollow dog carrying member mounted in said bearing, a nut threaded to said dog carrying member and engaging the bearing, a rod extending through the dog carrying member, a head formed on said rod, a nut threaded to said rod and engaging the dog carrying member, and spring pressed dogs pivoted to said head and held collapsed by the dog carrying member until said member is freed thereof permitting said dogs to expand to engage with a grease retainer.

2,098,135
COMPOSITION FOR DESTROYING SUCKERS IN TOBACCO AND TOMATO PLANTS
Carl Onasorg Daughety, Ayden, N. C., assignor, by direct and mesne assignments, to Carolina Chemical Company, a corporation
No Drawing. Application January 19, 1937, Serial No. 121,375
4 Claims. (Cl. 47—1)



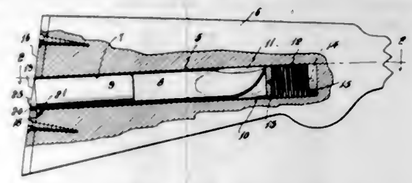
1. A substance for destroying suckers in tobacco and tomato plants, said substance containing essentially quantities of lubricating oil, linseed oil, creosote oil, gasoline, and fuel oil.

2,098,136
APPARATUS FOR USE IN MAKING CEMENT
Walter Dyckerhoff, Mainz-Amoeneburg, Germany
Application November 23, 1935, Serial No. 51,331
3 Claims. (Cl. 299—120)



1. A nozzle for use in atomizing a slurry in a cement kiln comprising a nozzle casing, a mouthpiece at the end of said casing presenting a trumpet-like flaring bore, the narrow part of which forms the outlet, while the wide part has a diameter approaching that of said casing, a conical core member extending centrally into said bore to form therein an annular conduit of outwardly decreasing diameter, and spiral guiding means forming a plurality of spiral conduits of low pitch leading from said casing to said mouthpiece and extending each through an angle of less than 360°.

2,098,137
RIFLE
Otto Elfstrom, Valdez, Territory of Alaska
Application July 16, 1935, Serial No. 31,662
4 Claims. (Cl. 42—70)



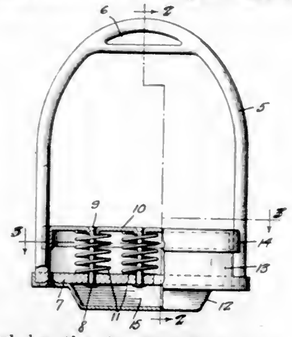
1. In a fire arm, a bolt, a firing pin operative in the bolt, a bolt shifting lever on the bolt, said bolt having an opening in one side thereof, said pin having an opening therein registerable with the opening in the bolt when the pin is in cocked position, said lever being pivotally connected to said bolt to swing longitudinally thereof, and a catch on the lever to enter the registering opening when the lever is swung to a position substantially parallel to the bolt.

2,098,138
MEANS FOR INSULATING BUILDINGS AND LIKE STRUCTURES
Joseph L. Finck, Washington, D. C., assignor of thirty per cent to I. Richard Paris, Washington, D. C.
Application September 23, 1932, Serial No. 634,604
17 Claims. (Cl. 72—16)

16. A building paper for walls having one or more air spaces, said building paper having the face thereof adapted to be disposed toward said air spaces coated with a thin layer of metal to minimize the passage of radiated heat through said air spaces.

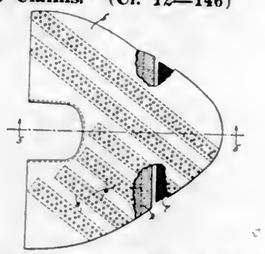
2,098,139
GUN AND HUNTING KNIFE COMBINATION
Vernon Foley and James J. Henning, Portland, Oreg.
Application April 22, 1937, Serial No. 138,445
2 Claims. (Cl. 42—1)

1. In combination, a stock provided with a bore open at one end thereof, said stock having a notch in communication with the bore, a knife removably disposed within the bore, latch means on the knife removably engageable in said notch, a butt plate on the stock overlapping the notch, a plate on the knife, said butt plate having an opening aligned with the bore and normally occupied by the second mentioned plate, said second mentioned plate having an elongated slot, said latch means being a latch member slidable transversely of the knife, an operating pin passing through the elongated slot and connected to the latch member, and follower means within the bore engageable by the knife to protect it and insure alignment of the latch member with the notch.



2,098,140
METHOD OF TUFTING AND ARTICLES THEREFOR
Annette Fridolph, New York, N. Y., assignor to A. B. A. Specialties Company, Inc., New York, N. Y., a corporation of New York
Application June 8, 1931, Serial No. 542,799
14 Claims. (Cl. 5—356)

1. The method of tufting mattresses, upholstery and the like, which includes passing one end of a completely preformed unitary tufting element comprising a flexible body with a substantial tufting head connected to each end thereof through the article being tufted by means of a needle or the like while the article is under compression so that said tufting heads will upon release of the compressed parts of the article each be caused to automatically engage opposite faces of the article being tufted with the body of the tufting element passing through the article being tufted.

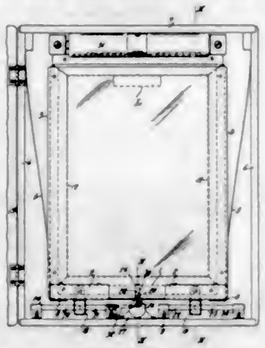


2,098,141
STIRRUP
Edward Galbreath, Auxvasse, Mo.
Application January 9, 1937, Serial No. 119,851
2 Claims. (Cl. 54—48)

1. A stirrup of the kind described comprising a body frame, a displaceable foot plate slidably fitting said body frame, posts fixed in said plate and slidable in the lowermost portion of the frame, springs about said posts and yieldably holding the foot plate, and a two-part housing, one part being formed by the plate and the other

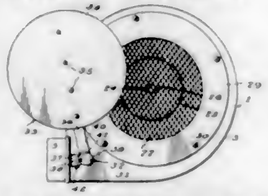
part carried by the lowermost portion of the frame to enclose the posts and springs.

2,098,142
METHOD OF MAKING SHOES
Charles A. Green, Hannibal, Mo., assignor to International Shoe Company, St. Louis, Mo., a corporation of Delaware
Application December 16, 1933, Serial No. 702,741
5 Claims. (Cl. 12—146)



1. The method of making a shoe vamp structure which comprises adhesively attaching a rear vamp lining member to the inner surface of a vamp member, forming series of perforations through said members and through said vamp member forwardly of said lining member, attaching a reinforcement to the inner surface of the vamp member in advance of said lining member, applying ornamental stitching through said vamp member and said lining member and through said vamp member and said reinforcement, securing a toe lining member to said rear lining member in a manner to form a smooth joint at the point of attachment, and then interposing and adhesively securing a box toe between the toe portion of the vamp member and the toe member of the lining.

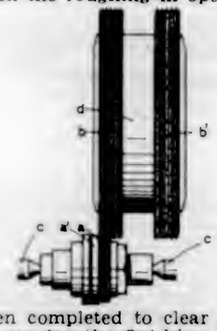
2,098,143
ADVERTISING OR DISPLAY DEVICE
Hamilton Grey, London, and Arthur Samuel Waddington, Crayford, Kent, England, assignors to Le Vane's Patents, Limited, London, England
Application March 17, 1936, Serial No. 69,370
In Great Britain April 2, 1935
11 Claims. (Cl. 40—139)



10. An advertising or display device comprising in combination an opaque casing member provided with opposed front and rear openings, transparent members closing the said openings, a sheet of transparent material having a device to be displayed applied thereto and movable therewith, means which are located within the

casing and support the sheet for movement within the casing and with its faces between the said openings, and means, located within the casing, operating to effect movement of the said sheet,

the said casing masking from view the supporting means, the moving means and also the edge of the sheet in all positions to which it is moved, when viewed through the front opening.



2,098,144
AIR CONTROLLING DEVICE FOR BLOWERS
John Hanus, Appleton, Wis.
Application July 20, 1936, Serial No. 91,582
2 Claims. (Cl. 230—114)

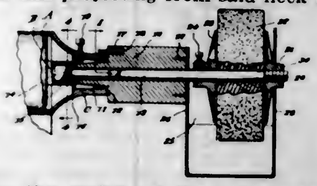
1. In an attachment for controlling the intake of air to a blower of that type having one of its sides formed with means spaced inwardly from the top, bottom, front and rear thereof to provide a screened air intake, the combination of a stud for connection to the lower portion of said side, said stud being spaced outwardly adjacent to and extending beyond said means, a disc for extension across said intake for varying the area of the latter, said disc being movable in an arcuate path and of greater area than said intake, an upstanding carrier having its upper portion fixed to said disc for suspending the latter permanently in a position to extend across said intake, said upper fixed portion of the carrier disposed diametrically of that face of the disc which opposes the intake, said carrier being adjustably mounted at its lower end on said stud, and means for releasably securing said carrier stationary in its adjusted position.

2,098,145
METHOD OF GRINDING SCREW THREADS IN SHOULDERED WORK
Stanley Jaffa Harley, Stivichall, Coventry, England
Application November 21, 1935, Serial No. 50,949
In Great Britain November 26, 1934
2 Claims. (Cl. 51—278)

1. The method of grinding screw threads in shouldered work which consists in causing a roughing in grinding surface and a finishing grinding surface to rotate as a unit, causing said roughing in grinding surface to engage the face of the work, causing relative axial movement between the work and said roughing in surface during the entire operation of said roughing in surface upon the work, causing relative radial movement between the grinding surfaces and the work when the roughing-in operation of the

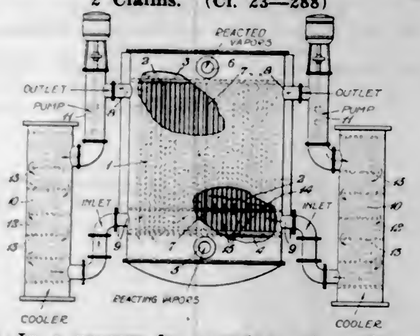
work has been completed to clear the shoulder on the work, causing the finishing grinding surface to operatively engage the work after the roughing-in grinding operation has been completed, and finally causing relative axial movement between the work and the finishing grinding surface during the entire operation of the latter upon the former.

2,098,146
POST DRIVER
Ernest Hunt, Globe, Ariz.
Application August 15, 1936, Serial No. 96,278
2 Claims. (Cl. 61—73)



1. A fence post driver comprising a hammering tube provided with a reduced lower end, and a guide sleeve removably secured to said reduced end and having guide ribs extending inwardly below the bottom of the tube and adapted to engage between the angularly disposed web and flange of a T-post.

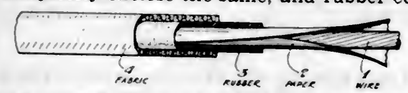
2,098,147
GRINDER ATTACHMENT
Ernie L. Hussmann, Selling, Okla.
Application July 16, 1936, Serial No. 91,016
1 Claim. (Cl. 51—241)



In combination with a driving unit having a casing formed with an open ended socket and a rotor having a shaft formed with a socket aligned with the inner end of the socket of the casing, a grinder comprising a sleeve having a reduced neck at its inner end fitting into the socket of the casing and disposing the inner end of the sleeve

close against the outer end of the socket, a cam screw threaded into the inner end of said sleeve in radial spaced relation to the bore thereof and projecting from the sleeve longitudinally thereof in overlapping and gripping engagement with the socket of the casing to hold the sleeve stationary, a set screw carried by the socket of the casing radially thereof and gripping said neck, a driven shaft journaled through the bore of said sleeve with one end projecting from said neck and en-

gaged in the socket of the rotor shaft, said driven shaft having its other end portion projecting from the outer end of said sleeve, a grind stone carried by the outwardly projecting position of said driven shaft, a water pan about the lower portion of said stone having inner and outer side walls perforated to receive the driven shaft, the inner side wall being firmly secured against the outer end of said sleeve and maintaining the water pan in operative relation to the grind stone.

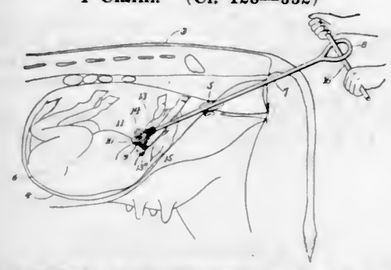


2,098,148
VAPOR PHASE CATALYTIC PROCESS AND APPARATUS
Carl H. B. Jarl, Royal Oak, Mich., assignor to Beck, Koller & Company, Inc., Detroit, Mich.
Application February 26, 1937, Serial No. 127,979
2 Claims. (Cl. 23—288)

1. In a process for carrying out exothermic vapor phase reactions in a converter, which includes a plurality of tubes through which the reacting vapors are passed, which tubes are surrounded by a heat transfer medium, said process including circulating the transfer medium through an outside cooler and returning the cooled transfer medium to the converter at the hot end thereof; the improvement which comprises passing said transfer medium through restricted openings located just prior to the zone of highest temperature so as to provide substantially uniform distribution of the cooled bath fluid adjacent the catalytic reaction zone.

2,098,149
LAMP CORD
John H. Jewell and Owen A. McNamee, Worcester, Mass., assignors to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Application June 1, 1931, Serial No. 541,414
9 Claims. (Cl. 173—264)

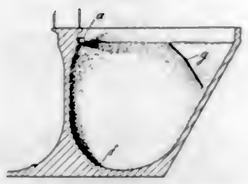
1. The combination of a conductor made from a plurality of uninsulated wires laid spirally together, a paper strip laid longitudinally directly on said conductor and folded thereabout so as to completely enclose the same, and rubber com-



pound applied over said paper strip to form an insulating covering, said paper strip being sufficiently strong to split said insulating covering when pulled at an angle to said conductor.

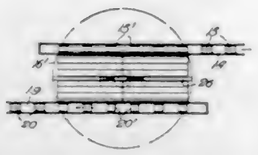
2,098,150
LOCK
Theodore H. Johnstone, Detroit, Mich.
Application October 30, 1933, Serial No. 695,759
19 Claims. (Cl. 70—419)

1. In lock structure, the combination of a casing, a cylinder rotatable in said casing and having tumblers therein with means tending to project said tumblers outwardly beyond the cylinder periphery, a sleeve rotatably journaled in said casing and surrounding said cylinder and having a slot for receiving the ends of the projected tumblers, said cylinder when said tumblers are withdrawn by the insertion of a proper key being rotatable without causing turning movement of said sleeve, locking means within said casing and means to cause operation thereof to lock the cylinder against turning, and means whereby said sleeve will prevent operation of said locking means when said cylinder is turned after withdrawal of the tumblers from the sleeve slot.



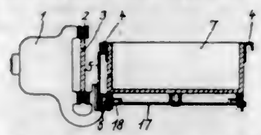
2,098,151
VETERINARY INSTRUMENT
Arthur H. Junge, Reedsville, Wis.
Application April 2, 1935, Serial No. 14,328
1 Claim. (Cl. 128—352)

In a veterinary instrument; a straight, elongated revoluble metallic stem having an integral endless part at its rear end forming a loop for the passage of a revolving means for the stem and an integral flat oppositely flared head part at its other end formed with curved side edges, said head part being provided intermediate its ends with an opening, a metalic chain extending through said opening, a removable metallic ring attached to one end of said chain and coacting with the head part for connecting the head part and chain together, said chain adapted to have a portion thereof wind on said stem, on the revolving of the latter and an enlarged metallic link



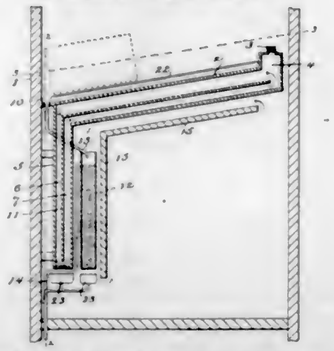
carried by the other end of said chain for the passage of a stretch of the latter and coacting with said stretch to form an adjustable metallic loop adjacent that portion of the chain wound on said stem.

2,098,152
TREATMENT OF SEWAGE AND OTHER WASTE LIQUORS
Herman Joseph Nicolaas Hubert Kessener, The Hague, Netherlands
Application September 27, 1935, Serial No. 42,518
In Great Britain October 6, 1934
7 Claims. (Cl. 210—8)



1. An apparatus for aerating sewage and other liquids, comprising a liquid containing tank, a shaft in a substantially horizontal position, means for rotatably supporting said shaft with its axis above the surface of the liquid in the tank, a plurality of aeration elements extending outwardly from said shaft, said aeration elements extending in a direction such that the acute angle between at least the outer portion of each aeration element and the horizontal as the said element enters the liquid, is less than the acute angle between the horizontal and a line passing through the outer end of the said aeration element and passing at right angles through the axis of the shaft, and means for correspondingly rotating said shaft in such a direction that each such line shall be in arrear of its corresponding aeration element, whereby the upper portion of the liquid is projected into the air in a flattened trajectory, and the main body is maintained in motion in a substantially circular path.

2,098,153
PUSH BENCH METHOD AND APPARATUS
Gavin Smellie McLay, London, England, assignor, by mesne assignments, to Stewarts and Lloyds, Limited, Glasgow, Scotland, a company of Great Britain
Application September 25, 1935, Serial No. 42,103
In Great Britain November 15, 1934
2 Claims. (Cl. 205—4)

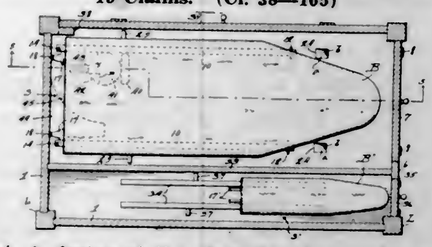


2. The combination with push bench apparatus and stripping means to remove a tube from a mandrel of a longitudinally divided turntable for reversing the mandrel, means for feeding a mandrel from the stripping means to one side of the divided turntable and means for simultaneously feeding a mandrel from the other side thereof back to the push bench apparatus.

2,098,154
TRANSFER DEVICE
Hans Mauch, Berlin-Charlottenburg, Germany, assignor to Telephon-Apparat-Fabrik E. Zwietusch & Co., G. m. b. H., Berlin, Germany
Application October 13, 1933, Serial No. 693,432
In Germany October 17, 1932
5 Claims. (Cl. 104—48)

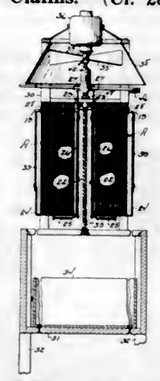
1. A transfer system for conveyor plants comprising in combination, several tracks, each having a point of transfer in common with one of the other tracks, conveying elements running on said tracks, a container holding device on each of said conveying elements, a circulating chain surrounding each container at the bottom thereof and having parallel runs, a bar on each conveying element adapted at the point of transfer between two containers to engage and drive the circulating chain on the container carried by another conveying element, a lock element on each container adapted to engage opposite runs of the circulating chain when no transfer is being made, and means on each conveying element adapted to disengage the lock element when transfer is about to be made on the container of another conveying element.

2,098,155
REFRIGERATED CABINET
Vicente Miñana and Julio Armando Gallano, Buenos Aires, Argentina
Application December 3, 1934, Serial No. 755,814
Renewed June 24, 1937
2 Claims. (Cl. 62—53)



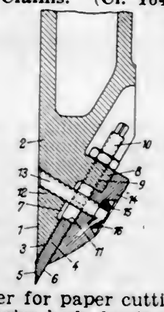
1. A refrigerated cabinet including an elongated vessel extending over the top and one side of a food chamber, said vessel being designed to contain a refrigerant and being arranged in the cabinet, with one part of said vessel arranged over the top of the food chamber and inclining downwardly toward a second part of said vessel, which latter is arranged at one side of the food chamber and extends vertically of the cabinet, a partition within the vessel dividing it into two chambers, the partition at the ends being free of connection with the vessel to permit communication between the chambers at the respective ends of the vessel, a collecting chamber at the upper part of the vessel, said vessel and chamber forming a closed thermo-siphon circuit, that portion of the vessel extending over the top of the food chamber serving as a support for a solid refrigerant.

2,098,156
IDENTIFYING MEANS FOR AUTOMOBILES AND THE LIKE
Jens P. Nielsen, Takoma Park, Md.
Application March 11, 1937, Serial No. 130,384
6 Claims. (Cl. 40—2.2)



1. In combination with a wall of a vehicle body, an identifying plate overlying said body, spacing members interposed between said wall and plate, said members being non-rotatable with respect to the wall, said spacing members each having a bore, a portion of which is angular in cross section, headed members insertible from without through the plate, spacing members and wall of the body, said headed members having angular portions fitting within the angular portions of the bores of the spacing members to hold the headed members against rotation, and holding means engaged with the headed members at the inner side of the wall of the body.

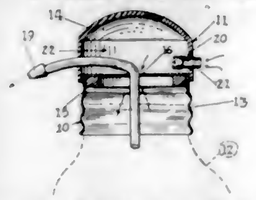
2,098,157
COMBINED TABLE AND IRONING BOARD
George Friederick Nurenberg, Trenton, N. J.
Application March 31, 1936, Serial No. 71,968
15 Claims. (Cl. 38—105)



4. A device of the character described comprising a structure including a top member, a panel supported therebeneath and spaced therefrom to provide a compartment, an ironing board movable within said compartment, rails carried by said ironing board for direct endwise sliding movement with respect to the board, outstanding members carried by the rails for contact with parts of the structure to limit the outward movement of the board, and coacting means carried by the board and rails for limiting the outward relative sliding movement between the rails and board, said board being freely supported upon the panel when the board is within the compartment.

2,098,158
BANK STATEMENT SHEET AND CARBON SEPARATING APPARATUS
Joseph A. O'Neill, Toledo, Ohio
Application July 31, 1936, Serial No. 93,729
10 Claims. (Cl. 282—1)

1. A device of the character described comprising an upstanding open frame having a box-like receiver, cross bars built within said frame above the receiver and accessible from opposite sides of said frame, racking plates removably suspended from said bars and having cleat flanges at opposite sides thereof, frontal housings slidably interfitted with said plates at the cleat flanges thereof, racking pins on said plates and having slip latched clamping bars, an electric motor type fan above the housings, a hood about the fan for directing draft therefrom downwardly in the direction of the housings, and rotatable brushes movable into engagement with work when upon the pins and rotated by the fan.



2,098,159
CUTTING DEVICE
Kuno Peiseler, Leipzig, Germany, assignor to Karl Biagosch, Leipzig, Germany
Application August 23, 1935, Serial No. 37,559
In Germany May 25, 1935
6 Claims. (Cl. 164—58)

1. In a cutter for paper cutting machines and the like, a carrier body having a wedge-shaped lower edge portion, the front face of said wedge portion being vertical and the rear face thereof being inclined at an acute angle to said front face, said body having a rib extending longitudinally of the rear face of the body and spaced from said edge portion, a clamping plate, said clamping plate having upper and lower inner faces parallel to the rear face of the body, the upper face of said clamping plate being offset and seating against the outer face of said rib, clamping screws connecting said body and clamping

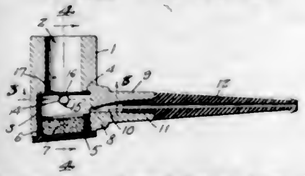


plate between said rib and said edge portion of said body, a cutter blade held between the lower portions of said body and plate and having a beveled cutting edge and parallel front and rear faces, and adjusting screws passing through said rib and engaging the upper edge of said blade.

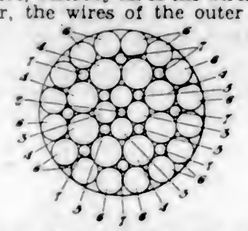
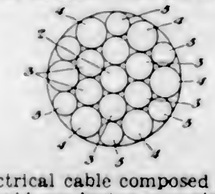
2,098,160
DISPENSING DEVICE
Palmer L. Perritt, San Francisco, Calif.
Application February 25, 1935, Serial No. 8,141
1 Claim. (Cl. 299—96)

In a device of the class described, a liquid container, a screw cap member therefor, a resilient washer fitted in the upper end of said screw cap and having a perforation formed therein, an ejector tube extending through the perforation in said washer and having a spray nozzle formed at its outwardly bent end, a resilient ejector element fitted over the upper edge of said screw cap and forming a chamber above said washer, and a ball check valve fitted through one side of said resilient element, whereby when pressure is applied to said ejector element, fluid is forced from the container through said ejector tube, thereby simultaneously closing said check valve, and when said ejector element is released, said check valve opens, allowing a charge of air to enter the chamber for the next ejecting operation.



2,098,161
TOBACCO PIPE
Frederick Pilant, Granby, Mo.
Application April 13, 1936, Serial No. 74,185
1 Claim. (Cl. 131—12)

A tobacco pipe comprising a bowl having a bore reduced to provide a shoulder therein, a tube having open ends and bridging the bore for disposal through the wall of the bowl, a grate seated on the shoulder and held accordingly by the tube engaging the underside thereof, said grate being spaced from the bottom of the bowl to provide a chamber, said tube having an opening in the underside thereof to be directed toward the chamber, a stem on the bowl and having its bore communicating with the chamber, and a mouth piece secured to the stem.

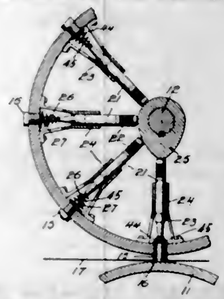


2,098,162
ELECTRICAL CABLE
Malcolm W. Reed, Cleveland, Ohio, assignor to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Application December 30, 1935, Serial No. 56,821
11 Claims. (Cl. 117—58)

1. An electrical cable composed of at least one conductor, said conductor comprising a plurality of wires wound helically around a core in three concentric layers of the same pitch or lay with fillers positioned between each of the respective layers, whereby all of the wires track with one another, the wires of the outer layer each

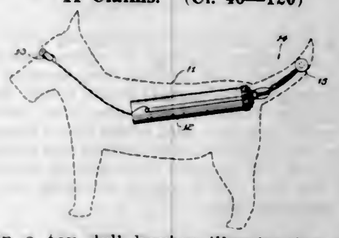
being larger in diameter than the wires of the inner layer but smaller in diameter than the wires of the intermediate layer, each of said conductors having a volume efficiency of approximately 85 per cent.

2,098,163
ELECTRICAL CABLE
Malcolm W. Reed, Shaker Heights, Ohio, assignor to The American Steel and Wire Company of New Jersey, a corporation of New Jersey
Application January 2, 1936, Serial No. 57,297
12 Claims. (Cl. 117—58)



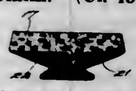
1. An electrical cable composed of at least one conductor, said conductor comprising a core and a plurality of wires wound helically about the said core in two concentric layers of the same pitch or lay, whereby all of the wires track with each other, the core wire and one-half of the wires of the outer layer of wires being of the same diameter, the wires of the inner layer being smaller in diameter than one-half of the wires of the outer layer and larger in diameter than the other half of the wires of said outer layer.

2,098,164
PARCEL CHECK
William A. Rice, Richmond, Va.
Application May 14, 1935, Serial No. 21,462
2 Claims. (Cl. 40—21)



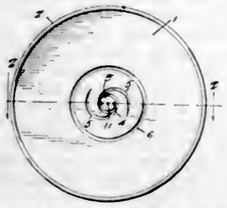
1. A parcel check comprising a body portion of uniform width adapted to be folded on itself, a passenger stub detachably attached to the body portion and having an identifying indicia thereon, similar identifying indicia on the body portion at the other end thereof, and an adhesive area on the body portion directly underlying the identifying indicia in the gummed position and on the opposite face of the body portion which is adapted to be gummed to the body portion after the body portion is folded on itself to affix the check to a parcel, whereby danger of re-use of the check is minimized.

2,098,165
PRINTING AND CUTTING MACHINE
John W. Riggenbach, Fall River, Mass.
Application August 24, 1936, Serial No. 97,682
5 Claims. (Cl. 101—226)



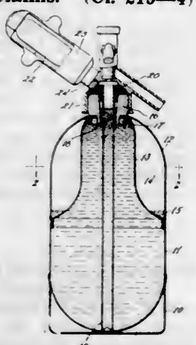
1. A machine of the character described comprising a frame, a roller rotatably supported in the frame and having peripheral printing reliefs, a bed roller beneath said first-named roller and rotatably supported in said frame, a plurality of punches within said first-named roller and working through said reliefs, and means interiorly of the first-mentioned roller for operating the punches successively at a determined point of rotation of said first-mentioned roller.

2,098,166
TOY EYE-BLINKING AND TAIL-WAGGING DEVICE
Henry Rubenstein, New York, N. Y.
Application July 30, 1936, Serial No. 93,502
11 Claims. (Cl. 46—120)



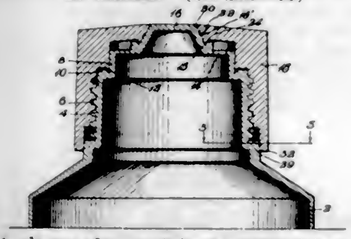
1. In a toy doll having illuminating eye elements, the combination of a source of electric current and a vibratory switch in circuit with said current source and said illuminating eye elements, said vibratory switch comprising a resilient arm anchored at one end and weighted at its opposite end and adapted to alternately close and open an electric circuit including said eye elements upon being impacted to simulate the blinking of said eye elements, said arm being rendered resilient by being formed of metal under torsion.

2,098,167
CARBIDE LAMP
Charles W. Schafer, Galena, Kans.
Application August 24, 1936, Serial No. 97,694
1 Claim. (Cl. 48—4)



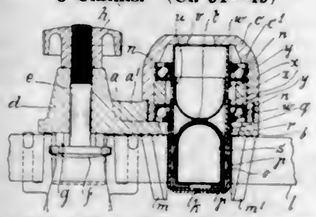
A filtering pad for a carbide lamp having a carbide container, a water font separably connected with said container and a feed water tube leading from the font to said container comprising a spongy porous body having an opening receiving said tube and fitted in the separable joint between the container and font for the sealing of said joint, a solid rubber sleeve fitting the opening in the said body and snugly embracing the tube, the said sleeve being extended below the body and having an enlarged annular formation providing a circular rim with a sloping upper face beneath said body, the body at its under face being downwardly tapered, and an impervious facing over substantially one-half of the diameter of the said downwardly tapered under face of the body.

2,098,168
SPINNING TOY
Edgar J. Sperry, Atlanta, Ga.
Application April 23, 1935, Serial No. 17,858
3 Claims. (Cl. 46—47)



1. A toy comprising a spinning element adapted to be thrown in the air and having a central recess and indentations disposed in the recess, pointed means to be received in any one of some of the indentations for spinning said element thereby and in one indentation for the element to spin thereon, guide ribs formed on the spinning element and communicating with the recess for directing the spinning element on the pointed means to receive the latter in the recess, and the spinning element having an annular groove therein surrounding the ribs and recess and adapted to receive the pointed means therein.

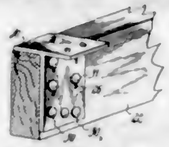
2,098,169
SODA SIPHON
Daniel C. Stewart, Astoria, Long Island, N. Y.
Application July 20, 1936, Serial No. 91,592
5 Claims. (Cl. 215—4)



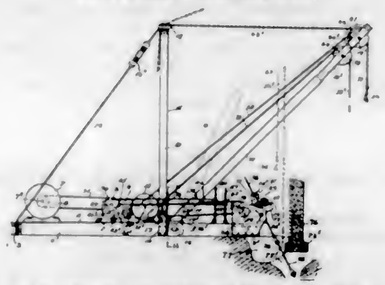
1. A siphon container for charged water comprising a bottle composed of sheet metal sections secured together; an annular vase secured in the upper part of the bottle having an opening at its lower end portion leading into the water compartment and providing an air chamber; and a screw threaded metal neck on the bottle removably to receive a siphon head.

2,098,170
CLOSURE FOR CONTAINERS
Charles C. Teas, Dallas, Iowa, assignor to Collapsible Tube Closures Inc., Olympia, Wash., a corporation of Washington
Application March 16, 1937, Serial No. 131,241
15 Claims. (Cl. 221—60)

1. A closure for containers, comprising a neck member, and a cooperating cap member for rotary engagement with the neck member, one of said members being slightly resilient and normally substantially circular, one of said members being provided with means adapted to bear against the other as they are turned into engagement with each other so as to distort the resilient member out of is normal shape, such distortion serving to increase the frictional grip of the resilient member on the other member.



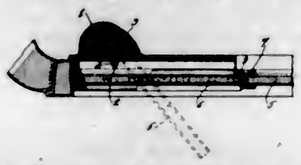
2,098,171
IMPREGNATING AND FRESHING-UP DEVICE FOR DRY INK RIBBONS OF TYPEWRITING MACHINES
Eugen van de Voorde, Bremen, Germany
Application March 18, 1936, Serial No. 69,598
In Germany December 6, 1935
8 Claims. (Cl. 91—49)



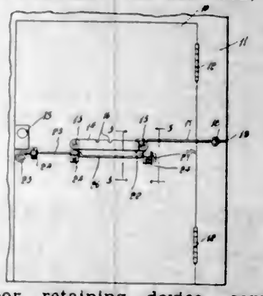
1. In a typewriter ribbon impregnating device, a pivotally adjustable arm having a guide hub at one end, a threaded bolt projecting upwardly through said hub and having a head on its lower end provided with a flat side, a locking plate projecting downwardly from said arm and bearing against the flat side of said head, a casing carried by said arm, an impregnating roller projecting downwardly from said casing, and means for guiding a typewriter ribbon around said roller.

2,098,172
METAL SUPPORTING DEVICE FOR BUILDING CONSTRUCTION
Frank R. Walker, Glencoe, Ill.
Original application October 25, 1934, Serial No. 749,995. Divided and this application May 16, 1936, Serial No. 80,146
9 Claims. (Cl. 20—95)

1. A supporting unit for building construction to overcome the damaging effect coincident to the shrinking of beams or joists, comprising a shoe for supporting a structure superposed above the beam or joist, said shoe having a transverse member at its upper end on which the superposed structure rests and holes at the lower end thereof, the holes receiving the fastening means for rigidly securing the shoe to near the lower edge of the beam or joist whereby to allow for shrinking of the beam or joist between the top and bottom thereof while maintaining the superstructure supported on the shoes and the ceiling at the under side of the joists at their original heights.

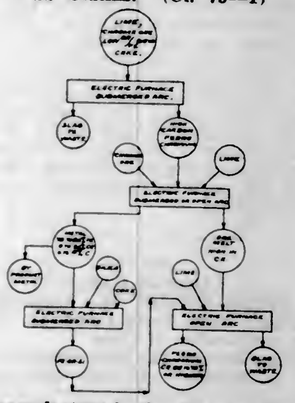


2,098,173
EXCAVATING AND HOISTING MACHINE
George E. Baldry, Winnipeg, Manitoba, Canada
Application January 2, 1937, Serial No. 118,885
In Canada November 21, 1935
10 Claims. (Cl. 255—23)



1. In a device for manipulating an earth boring tool, a support having an open ended slot therein, a flexible tool driving line passing from the tool upwardly through the slot, a line driving wheel slidably receiving the line and rotatably carried by the support, said wheel being demountable from the support to permit of the freeing of the line from the support by a lateral movement through the slot and a source of power for driving the mounted wheel.

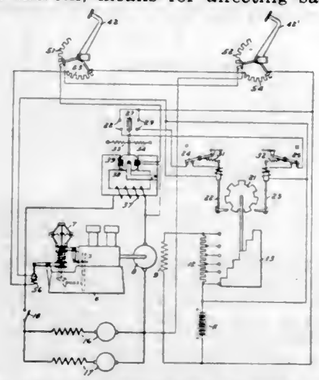
2,098,174
VEHICLE WINDOW SCREEN
Bernice F. Giberson, Superior, Wis.
Application June 26, 1936, Serial No. 87,561
1 Claim. (Cl. 156—14)



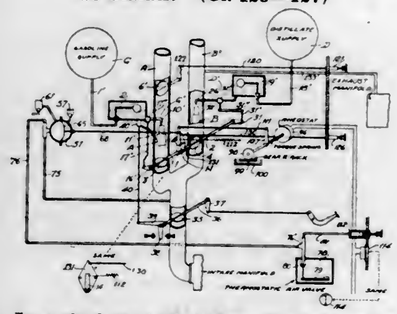
A protector comprising a frame constructed from a narrow flat strip of metal shaped to fit a window frame of a motor vehicle and having slots opening outwardly through an edge thereof to receive fasteners of the window frame, a screen carried by the first-named frame, said screen having an offset portion to provide a space in which a portion of a window panel may swing, and a flange formed on the first-named frame opposite from said offset portion to engage a guide post of the window frame.

2,098,175
DOOR HOLDER
John Harrison, Malad City, Idaho
Application January 28, 1937, Serial No. 122,828
4 Claims. (Cl. 292—271)

2. A door retaining device, comprising a notched plate, a latch member adapted to engage said notches, a releasing member arranged substantially parallel to said plate and having an offset portion forming a lever to engage the free end of said latch member to release it from said notches.



2,098,176
MANUFACTURE OF CHROME ORE PREPARATIONS
Marvin J. Udy, Niagara Falls, N. Y.
Application March 19, 1934, Serial No. 716,433
22 Claims. (Cl. 75—1)

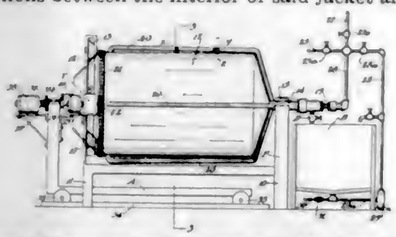


4. A manufactured chrome ore preparation adapted for reduction by ferrosilicon in smelting to produce low carbon ferrochromium of high chromium content which consists of an altered natural chrome ore of the ferrous chromite type containing the greater part of its original chromium oxid content and having substantially all its iron oxid removed therefrom and containing calcium chromite replacing the original ferrous chromite, being of a fused glassy character and chemically basic.

2,098,177
ELECTRIC DRIVE SYSTEM
Theodor Buchhold, Mannheim-Neuostheim, Germany, assignor to Aktiengesellschaft Brown Boveri & Cie., Baden, Switzerland, a joint-stock company of Switzerland
Application September 16, 1932, Serial No. 633,469
In Germany September 16, 1931
10 Claims. (Cl. 290—17)

3. In a system of the character described, in combination, a prime mover having means operated thereby for governing the supply of operating fuel thereto, an electric current generator driven by said prime mover, a load circuit supplied with energy by said generator, an excitation circuit for said generator having a resistance included therein, means for affecting said resistance to vary the excitation of said generator, means operable responsive to and in dependence upon changes in power supplied by said generator to the first said circuit for controlling operations of the second said means, and means for modifying at will the operations of the first and third said means.

2,098,178
FUEL CONTROL SYSTEM
Herbert M. Corse, near Green Cove Springs, Fla.
Application May 29, 1933, Serial No. 673,520
28 Claims. (Cl. 123—127)



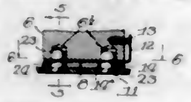
1. In a fuel control system for internal combustion engines using more than one fuel, carbureters including Venturi means, a throttle means, proportioning mechanism controlled by the depression between said Venturi means and the said throttle means for varying the proportions of the fuels supplied to the combustion chamber of the engine, and means for retarding the change in proportions as the engine throttle is opened.

2,098,179
COMBINED PASTEURIZER, CHURN, AND BUTTER-WORKER
Joseph G. Devenney, Minneapolis, Minn.
Application December 12, 1934, Serial No. 757,117
3 Claims. (Cl. 31—33)

2. In a combined pasteurizer and butter churn, a drum mounted for revolution on a horizontal axis and comprising an inner container casing of substantially oval cross sectional shape, said

inner casing having a smooth interior entirely free from working mechanism and restrictions, an outer casing spaced from said inner container casing and surrounding the greater portion of the peripheral wall thereof to form a jacket for containing a temperature conditioning fluid, connections between the interior of said jacket and a

source of temperature conditioning fluid whereby a circulation of such fluid may be effected during revolution of said drum, and means for revolving said drum at a speed which in view of the oval cross sectional shape of said container casing will produce a wave roll churning action upon the contents of said container casing.



2,098,180

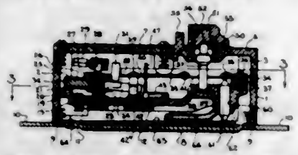
HAIR CLIPPER

James W. Dilks, Chicago, Ill., assignor to Moore Electric Corporation, Chicago, Ill., a corporation of Illinois

Application December 14, 1936, Serial No. 115,655

9 Claims. (Cl. 30—221)

8. A hair clipper comprising a clipper head, a cutter assembly, driving mechanism carried by said body adapted to actuate said cutter assembly, and means for detachably securing said head and cutter assembly, comprising a plurality of spaced lugs extending from said assembly, a member slidably mounted on said head having shoulder portions adapted to engage said lugs, said member terminating in an angled portion extending along a side of said head, and spring means disposed in said head bearing against said angled portion and yieldingly holding said shoulder portions in engagement with said lugs.



2,098,181

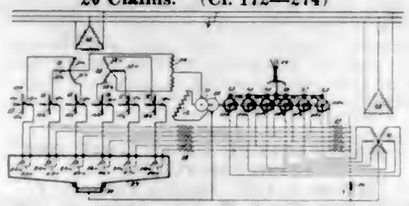
ELECTRIC SWITCH

Earnest J. Dillman, Detroit, Mich., assignor to Detroit Lubricator Company, Detroit, Mich., a corporation of Michigan

Application March 9, 1934, Serial No. 714,743

24 Claims. (Cl. 200—138)

1. A device of the character described, comprising a base member, a supporting member adjustably mounted at one end on said base member, a permanent magnet adjustably supported on said supporting member and extending longitudinally thereof, means to move said magnet relative to said supporting member, a contact member on said supporting member adjacent the inner end of said magnet, a contact carrying arm pivotally secured at one end to said supporting member and extending longitudinally thereof into spaced overlying relation to said magnet and said contact member, a contact member carried by said arm and cooperable with said first-named contact member, power means for actuating said arm and operatively connected thereto, and means to adjust said supporting member relative to said base member whereby to regulate the operation of said arm by said power means.



2,098,182

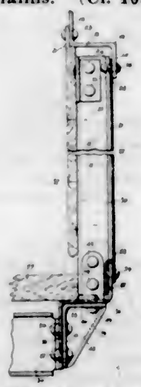
MOTOR CONTROL SYSTEM

Isadore K. Dortort, Milwaukee, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis., a corporation of Delaware

Application October 1, 1932, Serial No. 635,842

20 Claims. (Cl. 172—274)

1. In a control system for a motor having a plurality of armature windings and a field winding each divided into a plurality of angularly displaced sections, an alternating current supply line connected with said windings, an electron discharge device connected with the windings of the motor for controlling the energization thereof, a source of potential, adjustable means controlling the operation of said device by controlling the connection of said source therewith, and means for inducing the simultaneous energization of at least two portions of different ones of said armature windings.



2,098,183

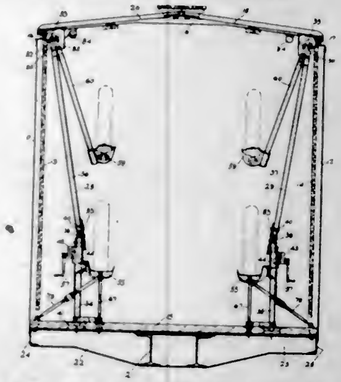
HOUSE CAR

Carl E. Eklind, Chicago, Ill., assignor to The Youngstown Steel Door Company, Cleveland, Ohio, a corporation of Ohio

Application January 21, 1936, Serial No. 60,085

7 Claims. (Cl. 105—409)

1. A railway house car converted from a wooden sheathed house car having an underframe, including metallic cross members and side sills, said converted house car embodying the parts of said underframe with the exception of said side sills which are removed, metallic side and door posts spaced laterally outwardly of the ends of said cross members, side plates, means securing the upper ends of said posts to said side plates, metallic sheathing, means securing the upper margin of said sheathing to said side plates, means securing said sheathing to said posts in laterally outwardly spaced relation to the ends of said cross members, metallic connecting members for closing the space between said sheathing and cross members secured to the lower margin of said sheathing, said connecting members extending inwardly below the lower ends of said posts and being secured directly to said cross members, said connecting members extending continuously from end to end of the car and constituting side sills for said underframe and brackets secured to the lower ends of said posts and to said connecting members.



2,098,184

AUTOMOBILE ELEVATING AND SUPPORTING STRUCTURE

Eugene J. Fehr, Hammond, Ind., and Kenneth J. Tobin, Chicago, Ill., assignors, by mesne assignments, to Evans Products Company, Detroit, Mich., a corporation of Delaware

Application March 20, 1933, Serial No. 661,778

11 Claims. (Cl. 105—368)

1. In a railway house car, an automobile elevating and supporting structure comprising a plurality of opposed transversely spaced substantially vertical members, means mounted upon each of said members capable of sliding movement thereon, operating mechanism carried by each of said means for imparting movement thereto and automobile engaging and supporting devices attached to said means and lying between said members, said members being adjustable toward and away from each other to support automobiles of different widths.

2,098,185

PIN OR BOLT LOCK

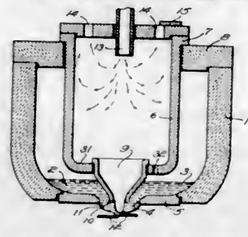
Cleon M. Hannaford, Petersburg, Va., assignor to Car Devices Company, Incorporated, Richmond, Va., a corporation of Virginia

Application July 21, 1936, Serial No. 91,766

8 Claims. (Cl. 85—8.5)

1. A pin or bolt lock, including a stem for insertion in an opening in the pin or bolt and having a leading end, means offstanding from said stem remote from said leading end and arranged to embrace the exterior surface of the pin or bolt, said stem being of a length sufficient to adequately engage the walls of said opening and provided adjacent to said offstanding

means with stop means to limit its insertion in said opening, whereby projection of the stem from said opening and proper engagement of said embracing means may be assured.



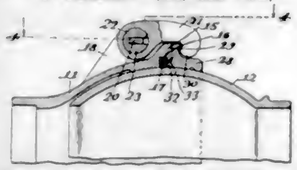
2,098,186

METHOD OF AND APPARATUS FOR FORMING HOLLOW GLASS ARTICLES

George E. Howard, Butler, Pa., assignor to Hartford-Empire Company, Hartford, Conn., a corporation of Delaware

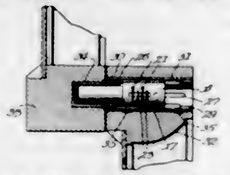
Application September 11, 1935, Serial No. 40,034

26 Claims. (Cl. 49—5)



23. Apparatus for forming hollow glass articles, comprising a container for a supply body of molten glass having a downwardly opening orifice at the bottom thereof, means associated therewith to cause the glass to flow through said orifice in an annular stream, a downwardly and inwardly beveled glass receiving member and a neck mold associated therewith for receiving the lower end of the annular stream of glass while it remains integral with the glass of said supply body, a neck pin associated with said neck mold, means associated with said neck mold and neck pin for applying suction to draw the lower end of the depending annular stream of glass into said neck mold and around said neck pin to form the neck finish portion of the desired article and thereafter to supply pressure to expand the article, a burner for supplying flame toward the interior of said annular stream of glass from above during and after the formation of a neck finish portion on the lower end thereof, a damper controlled outlet for the products of combustion from said burner for assisting in the control of the wall thickness of the article by the control of the pressure within a tubular body formed from the annular stream of glass during its formation, a body mold adapted to be associated with said neck mold subsequent to the removal of said beveled glass receiving member for surrounding the tubular body of glass while it is still integral with the glass of said supply body, shearing means for severing the tubular body of glass at a plane spaced above the upper end of the body mold and below said orifice and arranged to seal both ends of the tubular body of glass substantially at the plane of severance, and a bottom plate subsequently cooperable with said body mold to define the bottom of a cavity into conformity with which the severed glass is blown to form the desired article.

2,098,187
ADHESIVE MATERIAL
Milton H. Kemp, Oak Park, Ill., assignor to The Kendall Company, Boston, Mass., a corporation of Massachusetts
No Drawing. Application July 3, 1935, Serial No. 29,642
11 Claims. (Cl. 134—17)



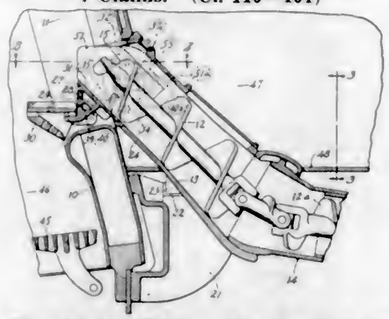
1. An adhesive material highly resistant to aging containing rubber and a plasticizer in such relative amounts and of a character to provide a plastic sticky mass, the plasticizer consisting essentially of one or more compounds selected from a group consisting of those containing a resinic acid radical treated to partially or wholly remove the unsaturated bonds thereof by saturation with hydrogen.

2,098,188
BALL JOINT
Robert F. Kinmont, Los Angeles, Calif.
Application May 9, 1936, Serial No. 78,887
5 Claims. (Cl. 285—91)

1. A device for securing the members of a ball joint in fluidtight engagement, comprising outer and inner joint members nested together, a plurality of pivoted latches mounted in bearings on the outer joint member for engaging the inner joint member, and wedges engaging the pivots and bearings of the latches for forcing the latches into locked engagement with the inner member.

2,098,189
KEY ACTUATED LOCKING BOLT
Herman H. Kistner, Baltimore, Md., assignor to Kistner Lock and Appliance Company, Baltimore, Md., a corporation of Maryland
Application September 18, 1935, Serial No. 41,115
10 Claims. (Cl. 70—90)

1. A bolt lock having a housing, a cylindrical bolt mounted therein for sliding and rotating movement, one end of said bolt being adapted for projection into a cooperating socket member in its locking position and the other end being grooved to receive a key, an abutment on said bolt spaced from its locking end, spring means surrounding said bolt between said abutment and a fixed part of said housing for retracting said bolt from locking position, a transverse abutment in said housing intermediate the ends of said bolt, said transverse abutment being spaced between said bolt abutment and grooved end of said bolt in unlocked position thereof, means on said bolt for engaging said transverse abutment in locking position to retain it against pressure of said spring, rotation of said bolt serving to disengage said means from said transverse abutment to permit retraction of the bolt, and key actuated means carried by said bolt to lock it against rotation in its locking position.

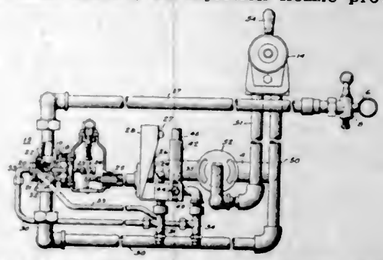


2,098,190
SUBSTITUTED SUCCINIC ACIDS AND ESTERS THEREOF AND USES THEREFOR
Lucas P. Kyrides, Webster Groves, Mo., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Application April 25, 1935, Serial No. 18,122
6 Claims. (Cl. 106—40)

2. A plasticized composition of matter comprising a material selected from a class consisting of styrol resins, vinyl resins, alkyd resins, phenol resins, and cellulose esters containing as a plasticizer a material of the formula:

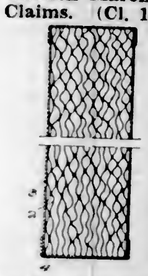
$$\begin{array}{l} H_2CCOOR_1 \\ | \\ RO—COOR_1 \end{array}$$

where R is a member of a class consisting of benzene nuclei and aliphatic hydrocarbon chains, and R_1 and R_2 are like or unlike radicals selected from a class consisting of aliphatic hydrocarbon residues, glycol residues and residues of esters of glycolic acid.



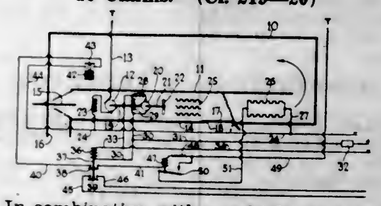
2,098,191
STOKER
Eugene Martin, Erie, Pa., assignor, by mesne assignments, to The Standard Stoker Company, Inc., New York, N. Y., a corporation of Delaware
Application July 20, 1934, Serial No. 736,203
7 Claims. (Cl. 110—101)

6. In a stoker, the combination of a conduit and a jet plate disposed at the delivery end thereof, said conduit having bottom and side walls, and a flange extending laterally from each side wall, the jet plate having a floor constituting a continuation of the bottom wall of said conduit and including flanged extensions at the sides of and extending above said floor and being disposed against the flanges of the conduit, and fastening members securing the flanged extensions of the jet plate to the flanges of said conduit, said jet plate including chambers underneath its floor extending into said flanged extensions, said flanged extensions having apertures for the introduction of pressure fluid to the chambers and said jet plate being provided with jet openings communicating with the chambers for the discharge of pressure fluid therefrom.



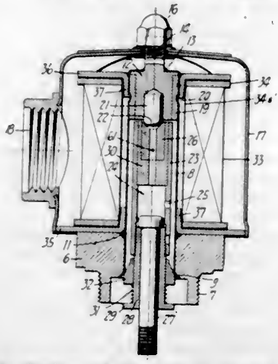
2,098,192
IGNITION AND CONTROL DEVICE FOR OVEN BURNERS
Birchard L. Matthews, Cleveland, Ohio, assignor to The Patrol Valve Company, Cleveland, Ohio, a corporation of Ohio
Application October 20, 1931, Serial No. 569,968
5 Claims. (Cl. 158—117.1)

1. In a gas burner control and ignition device, in combination, a main heating burner, a remotely positioned continuously operating pilot burner located outside the range of normal lighting proximity with respect to said main burner, an ignition burner located in lighting proximity to said main burner, an injection nozzle provided



by said ignition burner, and a flash tube having a vertically disposed portion adjustably secured to said ignition burner in gas conducting relation above said nozzle for conveying gas to said pilot burner and effecting the ignition of said ignition burner.

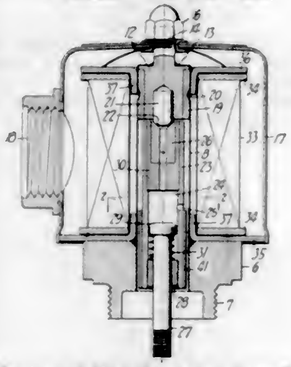
2,098,193
HEAT INSULATION
Carl Georg Munters, Stockholm, Sweden, assignor to Aktiebolaget Termisk Isolation, Stockholm, Sweden, a corporation of Sweden
Application March 1, 1934, Serial No. 713,622
In Sweden March 1, 1933
4 Claims. (Cl. 154—28)



4. Heat insulation comprising a plurality of sheets of paper forming intervening gas layers the limits of the thickness of which in the direction of heat flow are between .1 and 1.2 millimeters, and whose average thickness is substantially .5 millimeter plus or minus a thickness insufficient to decrease the heat transfer efficiency as compared to cork below 80%.

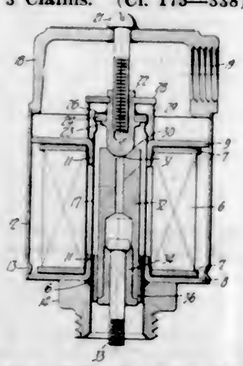
2,098,194
HEATING AND VENTILATING SYSTEM
Robert J. Parsons, Schenectady, N. Y., assignor to Consolidated Car-Heating Company, Inc., Albany, N. Y., a corporation of New York
Application June 12, 1936, Serial No. 84,878
10 Claims. (Cl. 219—20)

1. In combination with a vehicle, and an electrically energizable driving circuit therefor, of an enclosure to be heated and ventilated, a fan blower, heating resistances associated therewith, and means whereby the resistances are not placed in operation nor can the driving circuit be operated, until the fan is in operation.



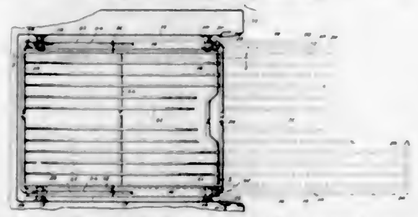
2,098,195
SOLENOID
William A. Ray, San Francisco, Calif., assignor to General Controls Company, a corporation of California
Application July 27, 1936, Serial No. 92,748
5 Claims. (Cl. 175—338)

1. In a device of the character described, a solenoid plunger having a longitudinal axis, a coil concentric about said axis for moving said plunger including a passage therein for receiving said plunger, means for supporting said coil, stop means engageable by said plunger at one end of said passage and cooperating with said plunger to center one end of said plunger on said axis, a cone shaped collar carried by said plunger and slidable along said plunger to engage said support means to center the other end of said plunger, and a spring urging said collar along said plunger.



2. In a device of the character described, a coil; magnetic members positioned at each end of the coil; a plunger; said coil and said members having a passage therethrough for said plunger with each of said members flanged inwardly along said passage to provide annular magnetic members at each end of said passage; a stop member including an outer magnetic stop member positioned within one of said annular members and extending into said passage, a non-magnetic stop member coextensive substantially with the inside of said outer magnetic member, and an inner magnetic stop member enclosed by said non-magnetic member at its side portion and end away from said plunger, said outer member, said non-magnetic member and said inner member being joined together as a substantially unitary structure fixed in position at one end of said passage; said plunger comprising a non-magnetic plunger member carrying a magnetic plunger insert therein for engaging said inner magnetic stop member, said plunger non-magnetic member enclosing said magnetic plunger insert substantially entirely at its side portion and end away from said stop member, and an outer magnetic plunger sleeve substantially surrounding said non-magnetic member and extending, when said stop member is engaged by said plunger insert, from closely adjacent said outer stop member to the annular member at the other end of said passage.

2,098,196
SOLENOID
William A. Ray, San Francisco, Calif., assignor to General Controls Company, a corporation of California
Application October 13, 1936, Serial No. 105,400
1 Claim. (Cl. 175—338)



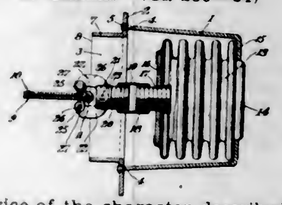
In a device of the character described, a coil having a passage therethrough, magnetic washers at either end of said coil, a solenoid plunger movable through said passage axially upon energization of said coil into engagement with stop means positioned at one end of said passage to align that end of the plunger in a definite single position axially of said passage, said plunger including an inner magnetic member encased at least partially by a non-magnetic member and an outer magnetic member extending substantially between said washers when said plunger engages said stop, said members being rixedly joined together into a single unit movable as such, said inner magnetic member engaging said stop means, and a non-magnetic sleeve carried by the plunger and positioned thereon to distribute more evenly flux from one of said washers adjacent the other end of the plunger and maintain said other plunger end in a single position in said passage whereby humming is absent.

2,098,197
SOLENOID
William A. Ray, San Francisco, Calif., assignor to General Controls Company, a corporation of California
Application November 20, 1936, Serial No. 111,891
3 Claims. (Cl. 175—338)

1. In a device of the character described, a solenoid plunger, a pair of spaced magnetic members, each member having an opening therein, a coil positioned between said members, said coil having a passage therethrough aligned with said opening in each member to provide a passage for said plunger, a stop member of magnetic material, means supporting said stop member in a fixed position and spaced from one of said pair of members at one end of said passage and projecting from above said one of said pair of members into said passage to adjacent the plane of said one of said pair of members, said plunger including a magnetic member providing a primary magnetic circuit and of a length sufficient substantially to bridge said pair of spaced magnetic members when said plunger is pulled into said passage, said plunger being hollowed out to receive and engage said stop member below that end of said plunger adjacent said stop, a first non-magnetic sleeve member positioned on and surrounding an intermediate portion only of said stop member to shield a portion of said stop member to provide a secondary magnetic circuit, and a second non-magnetic sleeve member secured on said plunger on that portion of said plunger adjacent the other of said pair of members when said plunger is pulled into said passage to distribute more evenly flux from said other of said pair of members and maintain said plunger in a single position in said passage whereby humming is absent.

2,098,198
SLIDING SHELF
Thomas A. Sindelar, Cleveland, Ohio, assignor to Truscon Steel Company, Youngstown, Ohio, a corporation of Michigan
Application April 21, 1936, Serial No. 75,606
2 Claims. (Cl. 211—143)

1. In a sliding shelf assembly for mounting in a cabinet structure, a pair of stationary channeled guide members for mounting adjacent the side walls of the cabinet, an intermediate channeled guide slidably mounted within each of the stationary guide members with its open side in register with that of the stationary guide and having an end portion extending forwardly of the stationary guide member, an upstanding pin on the end portion of the intermediate guide in front of the stationary guide member, a shelf having side rods slidably mounted in the intermediate guides and wholly inside of them, and a hook mounted on each of the side rods at substantially the longitudinal center thereof and extending through the open sides of the channel members, the ends of the hooks being rebent over the tops of the stationary guides and behind the pins on the sliding channels.

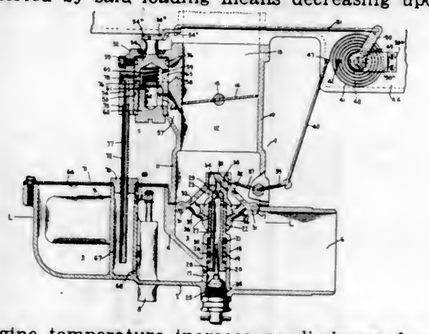


2,098,199
FERMENTATION OF AMYLACEOUS MATERIALS
Hugh R. Stiles, Terre Haute, Ind., assignor to Commercial Solvents Corporation, Terre Haute, Ind., a corporation of Maryland
No Drawing. Application March 2, 1934, Serial No. 713,692
14 Claims. (Cl. 195—44)

1. In a process for the production of normal butyl alcohol, acetone, and ethyl alcohol by the fermentation of an essentially starchy mash by means of bacteria of the group *Clostridium saccharo-acetobutylicum* while maintaining the acidity of the mash within the optimum range for fermentation, the improvement which comprises effecting the fermentation in the presence of ammonia nitrogen as the principal source of nitrogen for the bacteria.

2,098,200
BUTYL-ACETONIC FERMENTATION PROCESS
Hugh R. Stiles, Terre Haute, Ind., assignor to Commercial Solvents Corporation, Terre Haute, Ind., a corporation of Maryland
No Drawing. Application July 12, 1934, Serial No. 734,801
14 Claims. (Cl. 195—44)

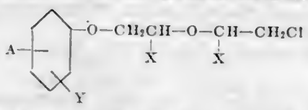
1. In the butyl-acetonic fermentation by means of *Clostridium acetobutylicum* (Weizmann) of mashes including as a major constituent a carbohydrate-containing material which is deficient in nitrogenous nutrients for said bacteria, the step which comprises effecting the fermentation in a mash containing proteinaceous material from grain alcohol distillery slop, the said proteinaceous material including the insoluble portion of said slop.



2,098,201
WATER CONTROL THERMOSTAT CONSTRUCTION
Marshall H. Ward, Fairfield, Conn., assignor, by mesne assignments, to Bridgeport Thermostat Company, Inc., Bridgeport, Conn., a corporation of Delaware
Application September 5, 1931, Serial No. 561,349
17 Claims. (Cl. 236—34)

1. A device of the character described, including in combination a frame or support, a valve seat member mounted upon one end thereof, a valve member supported upon said valve seat member, the valve proper being composed of two hinged parts, a thermostatic element mounted in said frame or support and operative connections between said thermostat element and each part of said valve.

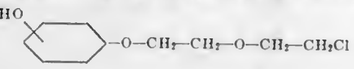
2,098,202
CARBURETOR
Walter H. Weber, Detroit, Mich., assignor to Detroit Lubricator Company, Detroit, Mich., a corporation of Michigan
Application April 3, 1934, Serial No. 718,800
25 Claims. (Cl. 261—39)



1. A carburetor of the character described, comprising a casing having a mixing chamber with main air and fuel inlets and a mixture outlet, valve means responsive to mixing chamber suction and controlling admission of air to said chamber, a thermostatically controlled supplemental fuel supply means operable to discharge fuel at sub-normal engine operating temperatures, a thermostatically controlled loading means for said valve means, said first-named and said second-named thermostatically controlled means acting simultaneously to regulate the ratio of fuel to air discharging from said outlet, the resistance exerted by said loading means decreasing upon

engine temperature increase as discharge from said supplemental means is decreased, and said loading means being so constructed as to resist opening movement of said valve means after discharge ceases from said supplemental means.

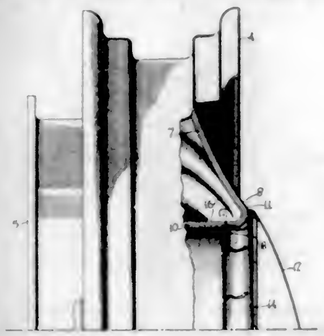
2,098,203
AROMATIC POLYETHER CHLORIDE
Herman A. Bruson, Philadelphia, Pa., assignor to Röhm & Haas Company, Philadelphia, Pa.
No Drawing. Application February 24, 1937, Serial No. 127,409
5 Claims. (Cl. 260—150)



5. A compound of the general formula

in which A is an alkyl radical containing from eight to eighteen carbon atoms inclusive, X is a member of the group consisting of hydrogen atoms and alkyl groups containing from one to five carbon atoms and Y is a member of the group consisting of a hydrogen atom and alkyl and alkoxy groups.

2,098,204
PHENOLIC CHLOROETHERS
Herman A. Bruson, Philadelphia, Pa., assignor to Röhm & Haas Company, Philadelphia, Pa.
No Drawing. Application May 15, 1937, Serial No. 142,808
5 Claims. (Cl. 260—150)



1. A phenol having the general formula

2,098,205
WHEEL STRUCTURE
Carolus L. Eksergian, Detroit, Mich., assignor to Budd Wheel Company, Philadelphia, Pa., a corporation of Pennsylvania
Application June 28, 1933, Serial No. 677,970
Renewed March 11, 1937
3 Claims. (Cl. 301—108)

2. In a wheel, a sheet metal body having an axially extending nave portion merging at its axially outer end into a generally radially outwardly extending portion, said axially extending

nave portion having formed around its perimeter spaced radially inwardly depressed portions formed from the body metal, axially inwardly facing shoulders provided on said depressed portions all in the same transaxial plane, in com-

bination with a hub cap having annularly arranged radially yieldable portions adapted to be moved into and retained in axial holding relation to said shoulders when these portions of the hub cap are axially telescoped with the nave portion.

2,098,206

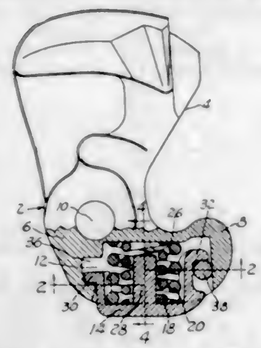
MANUFACTURE OF ALCOHOLS

Walter H. Hartung, Lansdowne, Pa., William G. Young, Los Angeles, Calif., and Frank S. Crossley, Philadelphia, Pa., assignors to Sharp & Dohme, Incorporated, Philadelphia, Pa., a corporation of Maryland

No Drawing. Application June 19, 1935, Serial No. 27,348

11 Claims. (Cl. 260—156)

1. The process of reducing aldehydes to the corresponding alcohols which comprises subjecting said aldehydes to the action of a secondary alkoxide of aluminum.



2,098,207

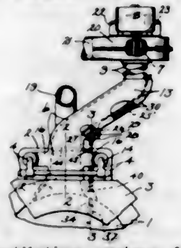
CAR COUPLER

Frank H. Kayler, Alliance, Ohio, assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey

Application May 6, 1936, Serial No. 78,183

20 Claims. (Cl. 213—155)

18. In a car coupler a pivoted knuckle having a resilient buffing face.



2,098,208

VENTILATOR FOR TOILETS

Ernest C. Madden, Rochester, Bert F. Cooper, Medina, and Earl R. Cuykendall, Rochester, N. Y., assignors to Rochester-Ventoilet Company, Rochester, N. Y., a corporation of New York

Application April 27, 1935, Serial No. 18,616

7 Claims. (Cl. 4—213)

1. In a ventilating system for a toilet bowl having a vertically movable seat, a ventilating pipe communicating with the interior of the bowl, means for circulating a current of air through the ventilating pipe, a normally closed damper in the pipe adapted to be opened by the action of said current of air, and means associated with the seat and effective when the seat is in a raised position for maintaining the damper in the closed position and to release said damper when the seat is in the lowered position.

2,098,209

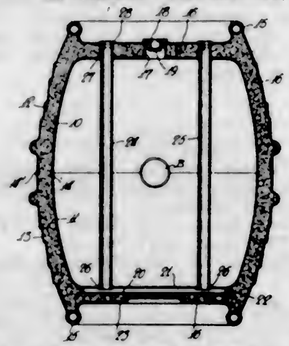
PROCESS FOR TREATING LETTUCE IN PACKING AND SHIPPING

Joseph H. Grande, Salinas, Calif.

No Drawing. Application June 7, 1937, Serial No. 146,959

5 Claims. (Cl. 99—193)

3. A process for treating lettuce for packing and shipment to prevent discoloration and ice burn thereof, and for bleaching the same, which comprises contacting the lettuce with a solution of an acid citrate salt and packing said lettuce in ice containing an acid citrate salt.



2,098,210

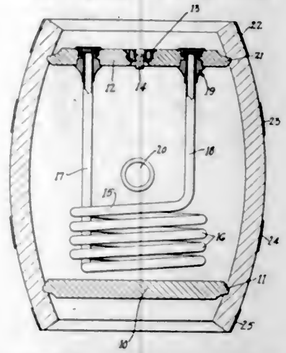
DISPENSING CONTAINER

Herman E. Schulse, Jersey City, N. J.

Application September 9, 1933, Serial No. 688,779

15 Claims. (Cl. 257—15)

1. A barrel for shipping, cooling and dispensing beverages, having a heat insulating side wall and heat insulating heads, a heat transfer structure substantially at the inner face of one of said heads having a surface in contact with the beverage, and a surface free from contact with the beverage and means including tubing accessible through the opposite head for introducing heat transfer fluid into contact with that surface of said heat transfer structure which is out of engagement with the beverage contents of the barrel.



2,098,211

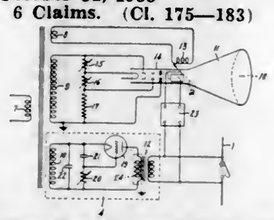
ART OF BREW COOLING

Herman E. Schulse, East Orange, N. J.

Application July 18, 1936, Serial No. 91,333

28 Claims. (Cl. 257—15)

1. A combination shipping, cooling and dispensing barrel for brew, comprising a heat insulating structure including a side wall and end walls, a draft outlet and a filling bunghole, said barrel having built thereinto a heat conductor presenting a heat conductive wall for contact of the brew within the barrel, said conductor being positioned so as not to interfere with the usual filling or racking tube when inserted through the filling bunghole and not to interfere with the draft tube when inserted through the draft outlet, said barrel having an inlet and an outlet through which cooling fluid may be circulated into heat abstracting contact with said conductor.



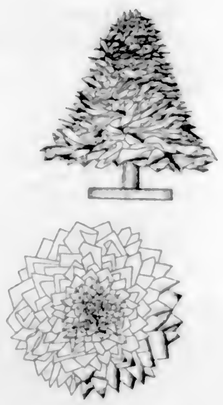
2,098,212

TESTING OF ELECTRICAL CIRCUITS

Kenneth J. R. Wilkinson, Rugby, England, assignor to General Electric Company, a corporation of New York

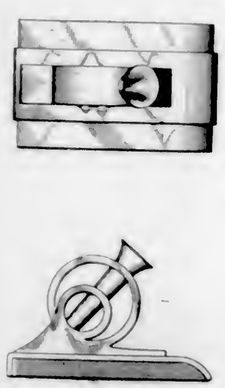
Original application November 21, 1936, Serial No. 111,990. Divided and this application April 29, 1937, Serial No. 139,792. In Great Britain October 31, 1935

6 Claims. (Cl. 175—183)



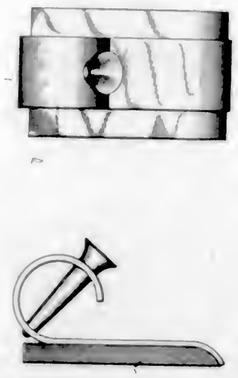
1. In combination, a circuit to be tested having a break therein, said circuit normally being closed and including a current supply source, means for applying at said break a current having a wave form corresponding to that of current flowing in the circuit when unbroken, and means for observing the resultant wave form of the voltage which appears across said break.

DESIGNS



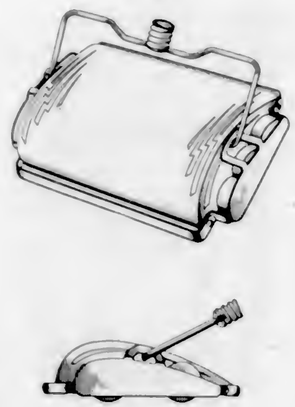
NOVEMBER 2, 1937

106,751
DESIGN FOR AN ARTIFICIAL TREE ORNAMENT
Irene M. Casey, Oakland, Calif.
Application December 31, 1936, Serial No. 66,819
Term of patent 14 years



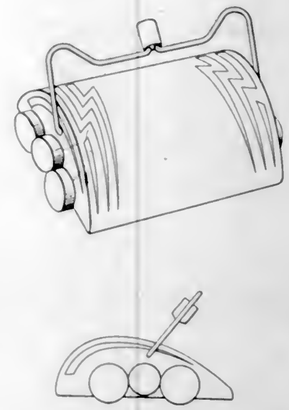
The ornamental design for an artificial tree ornament, substantially as shown.

106,752
DESIGN FOR A PEN AND PENCIL HOLDER
Francis M. Aimes, Yonkers, N. Y.
Application April 6, 1937, Serial No. 68,575
Term of patent 7 years



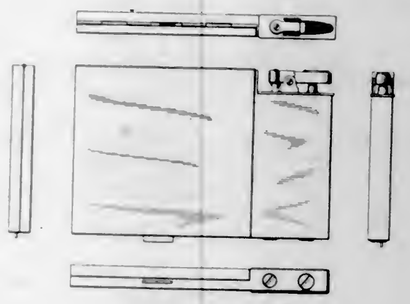
The ornamental design for a pen and pencil holder, as shown.

106,753
DESIGN FOR A PEN AND PENCIL HOLDER
Francis M. Aimes, Yonkers, N. Y.
Application April 6, 1937, Serial No. 68,576
Term of patent 7 years



The ornamental design for a pen and pencil holder, as shown.

106,754
DESIGN FOR A CARPET SWEEPER
Charles A. Anderson, New Rochelle, N. Y., assignor to Gotham Pressed Steel Corporation, New York, N. Y., a corporation of New York
Application August 11, 1937, Serial No. 70,995
Term of patent 3½ years

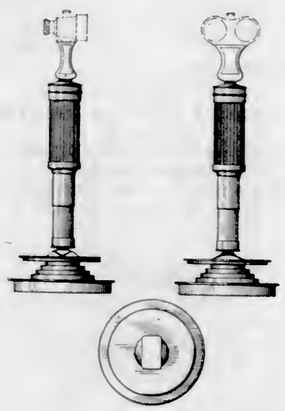


The ornamental design for a carpet sweeper, as shown.

106,755
DESIGN FOR A CARPET SWEEPER
Charles A. Anderson, New Rochelle, N. Y., assignor to Gotham Pressed Steel Corporation, New York, N. Y., a corporation of New York
Application August 11, 1937, Serial No. 70,996
Term of patent 3½ years

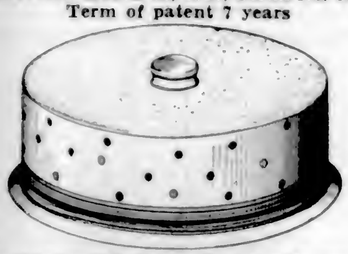
The ornamental design for a carpet sweeper, as shown.

106,756
DESIGN FOR A COMBINED PYROPHORIC LIGHTER AND CIGARETTE CONTAINER
Louis V. Aronson, Newark, N. J., assignor to Art Metal Works, Inc., a corporation of New Jersey
Application February 1, 1937, Serial No. 67,377
Term of patent 3½ years



The ornamental design for a combined pyrophoric lighter and cigarette container, substantially as shown.

106,757
DESIGN FOR A RUG
Richard F. Bemporad, Forest Hills, Long Island, N. Y., assignor to Atlantic Rug Co., Inc., New York, N. Y., a corporation of New York
Application July 30, 1937, Serial No. 70,729
Term of patent 7 years

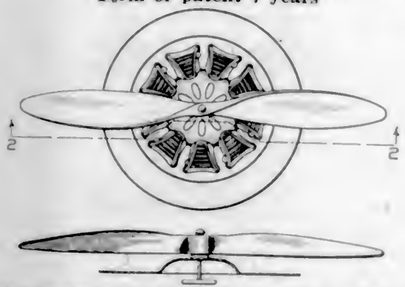


The ornamental design for a rug, as shown.

106,758
DESIGN FOR A TELESCOPIC VIEWING STAND OR SIMILAR ARTICLE
Charles A. Brewer, Noroton Heights, Conn.
Application September 10, 1937, Serial No. 71,546
Term of patent 14 years

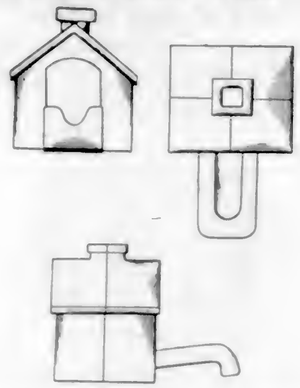
The ornamental design for a telescopic viewing stand or similar article, as shown and described.

106,759
DESIGN FOR A CAKE BOX
Martha H. Connor, Baltimore, Md., assignor to Owens-Illinois Can Company, Wilmington, Del., a corporation of Delaware
Application March 22, 1937, Serial No. 68,313
Term of patent 7 years



The ornamental design for a cake box, substantially as shown.

106,760
DESIGN FOR EMBROIDERED DECORATIVE ALPHABET FOR FORMING MONOGRAMS FOR WEARING APPAREL OR SIMILAR ARTICLE
Charles Emmey, New York, N. Y.
Application August 26, 1937, Serial No. 71,341
Term of patent 14 years



The ornamental design for embroidered decorative alphabet for forming monograms for wearing apparel or similar article substantially as shown and described.

106,761
DESIGN FOR A BUTTON OR SIMILAR ARTICLE
Thomas J. Flynn and Charles G. McClintock, Detroit, Mich.
Application August 9, 1937, Serial No. 70,938
Term of patent 7 years

The ornamental design for a button or similar article substantially as shown.

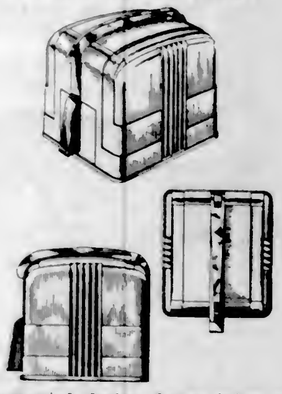
106,762
DESIGN FOR AN ASHTRAY
Horace A. Fuld, New York, N. Y.
Application September 9, 1937, Serial No. 71,514
Term of patent 3½ years

The ornamental design for an ashtray, substantially as shown.

106,763
DESIGN FOR A SHOE
Dave Gilbert, New York, N. Y.
Application September 25, 1937, Serial No. 71,784
Term of patent 3½ years

The ornamental design for a shoe substantially as shown.

106,764
DESIGN FOR A SHOE
Dave Gilbert, New York, N. Y.
Application September 25, 1937, Serial No. 71,785
Term of patent 3½ years



The ornamental design for a shoe substantially as shown.

106,765
DESIGN FOR A SHOE
Dave Gilbert, New York, N. Y.
Application September 25, 1937, Serial No. 71,786
Term of patent 3½ years

The ornamental design for a shoe substantially as shown.

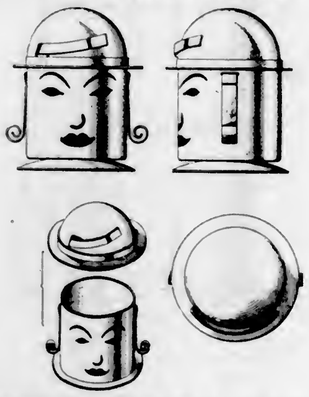
106,766
DESIGN FOR A JUICE EXTRACTOR
Thomas L. Hand, Cincinnati, Ohio, assignor to Foster L. Talge, doing business under the name and style of Rival Manufacturing Company, Kansas City, Mo.
Application June 5, 1937, Serial No. 69,679
Term of patent 14 years

The ornamental design for a juice extractor, substantially as shown.

106,767
DESIGN FOR A SHOE
Harry J. Heiser, New York, N. Y.
Application September 23, 1937, Serial No. 71,744
Term of patent 3½ years

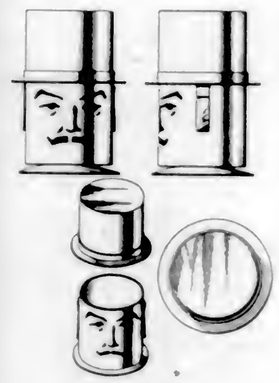
The ornamental design for a shoe substantially as shown.

106,768
DESIGN FOR A SHOE
Harry J. Heiser, New York, N. Y.
Application September 23, 1937, Serial No. 71,745
Term of patent 3½ years



The ornamental design for a shoe substantially as shown.

106,769
DESIGN FOR A SHOE
Alphons Hurzeler, New Rochelle, N. Y.
Application September 23, 1937, Serial No. 71,746
Term of patent 3½ years



The ornamental design for a shoe substantially as shown.

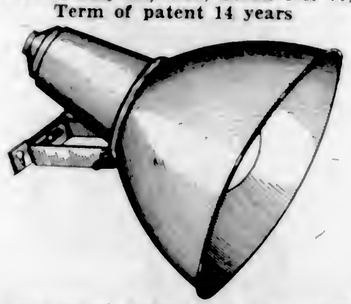
106,770
DESIGN FOR A CIGARETTE BOX
Ray Rice Hutcheson, Frederick, Md., assignor to The Everedy Company, Frederick, Md., a corporation of Maryland
Application September 1, 1937, Serial No. 71,416
Term of patent 14 years

The ornamental design for a cigarette box, as shown.

106,771
DESIGN FOR A CIGARETTE BOX
Ray Rice Hutcheson, Frederick, Md., assignor to The Everedy Company, Frederick, Md., a corporation of Maryland
Application September 1, 1937, Serial No. 71,417
Term of patent 14 years

The ornamental design for a cigarette box, as shown.

106,772
DESIGN FOR A NEGLIGEE
James N. Jebaily, New York, N. Y.
Application August 27, 1937, Serial No. 71,347
Term of patent 3½ years

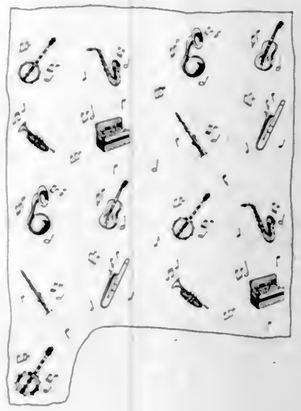


The ornamental design for a negligee, as shown and described.

106,773
DESIGN FOR A PLATE OR SIMILAR ARTICLE
William T. Johnson, New Brighton, Pa., assignor to Mayer China Company, Beaver Falls, Pa., a corporation of Pennsylvania
Application August 28, 1937, Serial No. 71,370
Term of patent 14 years

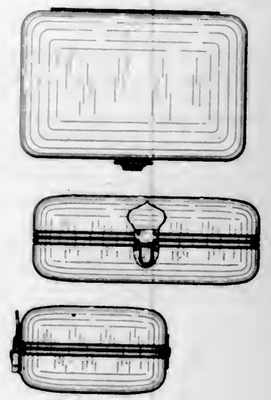
The ornamental design for a plate or similar article substantially as shown.

106,774
DESIGN FOR A LIGHTING FIXTURE
Paul D. Phillips, Elmhurst, Ill., assignor to Benjamin Electric Mfg. Company, Des Plaines, Ill., a corporation of Illinois
Application July 23, 1937, Serial No. 70,590
Term of patent 14 years



The ornamental design for a lighting fixture substantially as shown.

106,775
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Leo Sholtz, New York, N. Y.
Application September 23, 1937, Serial No. 71,753
Term of patent 3½ years

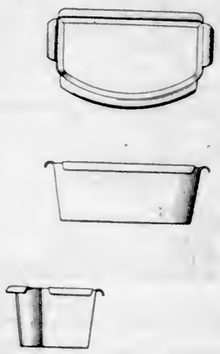


The ornamental design for a shoe or similar article, substantially as shown.

106,776
DESIGN FOR A TEXTILE FABRIC OR SIMILAR ARTICLE
Abraham Stone, Brooklyn, N. Y.
Application August 18, 1937, Serial No. 71,164
Term of patent 7 years

The ornamental design for a textile fabric or similar article, substantially as shown.

106,777
DESIGN FOR A KIT CASE
William E. Voigt and Egbert W. Voigt, Seattle, Wash.
Application August 21, 1937, Serial No. 71,226
Term of patent 14 years



The ornamental design for a kit case, as shown.

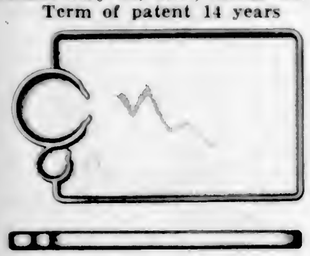
106,778
DESIGN FOR A COFFEE MAKER
Oscar M. Anderson, New Britain, Conn., assignor to Landers, Frary & Clark, New Britain, Conn., a corporation of Connecticut
Application September 11, 1937, Serial No. 71,575
Term of patent 14 years

The ornamental design for a coffee maker, as shown.

106,779
DESIGN FOR A PAN OR SIMILAR ARTICLE
William Andre, Brussels, Wis.
Application February 1, 1937, Serial No. 67,390
Term of patent 3½ years

The ornamental design for a pan or similar article, as shown.

106,780
DESIGN FOR A BATHROOM STOOL
George B. Bentz, New York, N. Y.
Application September 23, 1937, Serial No. 71,764
Term of patent 14 years



The ornamental design for a bathroom stool, as shown.

106,781
DESIGN FOR A COFFEE DISPENSER
Frank M. Boyles, Brooklyn, N. Y., assignor to Coffee Products Corporation, New York, N. Y., a corporation of New York
Application April 30, 1937, Serial No. 69,080
Term of patent 14 years

The ornamental design for a coffee dispenser, as shown.

106,782
DESIGN FOR A COMBINED TRAY AND BEVERAGE CONTAINER HOLDER
Joseph Dutar de Benque, New York, N. Y.
Application July 10, 1937, Serial No. 70,355
Term of patent 14 years

The ornamental design for a combined tray and beverage container holder, substantially as shown.

106,783
DESIGN FOR A BUCKLE
Silvia Dorée, New York, N. Y.
Application September 23, 1937, Serial No. 71,748
Term of patent 3½ years

The ornamental design for a buckle substantially as shown.

106,784
DESIGN FOR A BUCKLE
Silvia Dorée, New York, N. Y.
Application September 23, 1937, Serial No. 71,749
Term of patent 3½ years

The ornamental design for a buckle substantially as shown.

106,785
DESIGN FOR A BUCKLE
Silvia Dorée, New York, N. Y.
Application September 23, 1937, Serial No. 71,750
Term of patent 3½ years

The ornamental design for a buckle substantially as shown.

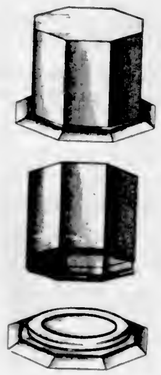
106,786
DESIGN FOR EMBROIDERED DECORATIVE ALPHABET FOR FORMING MONOGRAMS FOR WEARING APPAREL OR SIMILAR ARTICLE
Charles Emmey, New York, N. Y.
Application August 26, 1937, Serial No. 71,342
Term of patent 14 years

The ornamental design for embroidered decorative alphabet for forming monograms for wearing apparel or similar article substantially as shown and described.

106,787
DESIGN FOR A VASE
Maurice Exelmans, Paris, France, assignor to Verlys of America, Inc., New York, N. Y., a corporation of New York
Application March 31, 1937, Serial No. 68,494
Term of patent 7 years

The ornamental design for a vase, as shown and described.

106,788
DESIGN FOR A PAN PATCH
Charles Fischer, Newark, N. J.
Application July 23, 1937, Serial No. 70,591
Term of patent 7 years



The ornamental design for a pan patch, as shown.

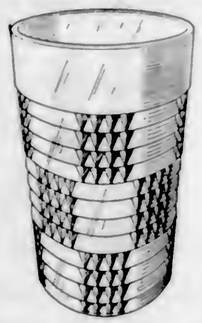
106,789
DESIGN FOR A PENCIL
Harald F. Gade, Philadelphia, Pa., assignor to Standard Pressed Steel Co., Jenkintown, Pa., a corporation of Pennsylvania
Application December 18, 1936, Serial No. 66,628
Term of patent 7 years

The ornamental design for a pencil, substantially as shown and described.

106,790
DESIGN FOR A CARTON
Raymond Guerlain, Paris, France, assignor to Guerlain Perfumery Corporation of Delaware, Wilmington, Del., a corporation of Delaware
Application June 12, 1937, Serial No. 69,811
Term of patent 14 years

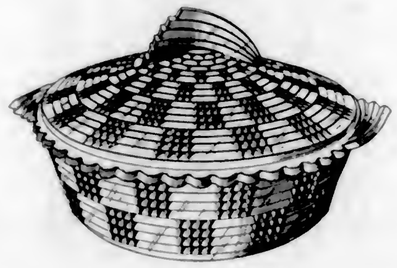
The ornamental design for a carton substantially as shown and described.

106,791
DESIGN FOR A SUGAR BOWL OR SIMILAR ARTICLE
Curtis B. Ilgenfritz and Edwin E. Slick, Jr., Pittsburgh, Pa., assignors to United States Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 22, 1937, Serial No. 69,982
Term of patent 7 years



The ornamental design for a sugar bowl or similar article, substantially as shown.

106,792
DESIGN FOR A MILK PITCHER OR SIMILAR ARTICLE
Curtis B. Ilgenfritz and Edwin E. Slick, Jr., Pittsburgh, Pa., assignors to United States Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 22, 1937, Serial No. 69,983
Term of patent 7 years



The ornamental design for a milk pitcher or similar article, substantially as shown.

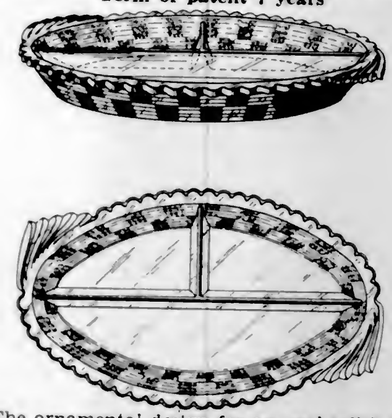
106,793
DESIGN FOR A TUMBLER OR SIMILAR ARTICLE
Curtis B. Ilgenfritz and Edwin E. Slick, Jr., Pittsburgh, Pa., assignors to United States Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 22, 1937, Serial No. 69,984
Term of patent 7 years

The ornamental design for a tumbler or similar article, substantially as shown.

106,794
DESIGN FOR A COMBINED BUTTER AND ALMOND TUB OR SIMILAR ARTICLE
Curtis B. Ilgenfritz and Edwin E. Slick, Jr., Pittsburgh, Pa., assignors to United States Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 22, 1937, Serial No. 69,985
Term of patent 7 years

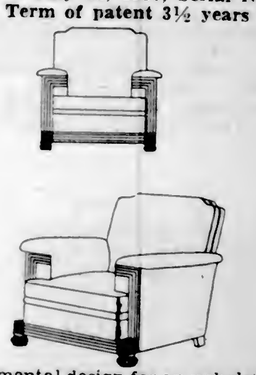
The ornamental design for a combined butter and almond tub or similar article, substantially as shown.

106,795
DESIGN FOR A DEEP BOWL OR SIMILAR ARTICLE
Curtis B. Ilgenfritz and Edwin E. Slick, Jr., Pittsburgh, Pa., assignors to United States Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 22, 1937, Serial No. 69,986
Term of patent 7 years



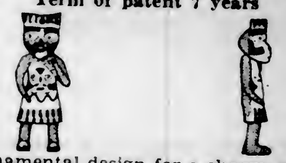
The ornamental design for a deep bowl or similar article, substantially as shown.

106,796
DESIGN FOR A NAPPY OR SIMILAR ARTICLE
Curtis B. Ilgenfritz and Edwin E. Slick, Jr., Pittsburgh, Pa., assignors to United States Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 22, 1937, Serial No. 69,987
Term of patent 7 years



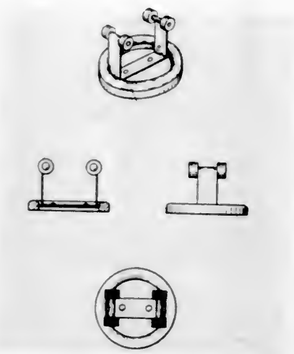
The ornamental design for a nappy or similar article, substantially as shown and described.

106,797
DESIGN FOR AN OVAL RELISH TRAY OR SIMILAR ARTICLE
Curtis B. Ilgenfritz and Edwin E. Slick, Jr., Pittsburgh, Pa., assignors to United States Glass Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 22, 1937, Serial No. 69,988
Term of patent 7 years



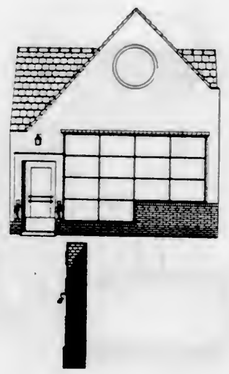
The ornamental design for an oval relish tray or similar article, substantially as shown.

106,798
DESIGN FOR AN UPHOLSTERED CHAIR OR SIMILAR ARTICLE
Sam Kaufman, Brooklyn, N. Y.
Application July 22, 1937, Serial No. 70,571
Term of patent 3½ years



The ornamental design for an upholstered chair or similar article substantially as shown and described.

106,799
DESIGN FOR A CHARM
Herman Krupp, Seattle, Wash.
Application April 12, 1937, Serial No. 68,677
Term of patent 7 years

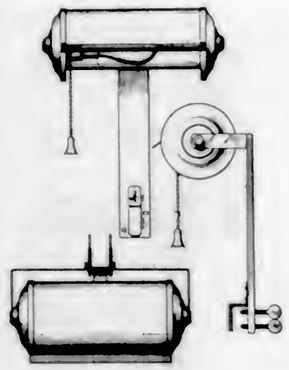


The ornamental design for a charm, as shown.

106,800
DESIGN FOR A PIPE HOLDER
Esther A. S. Langslow, New York, N. Y.
Application March 15, 1937, Serial No. 68,171
Term of patent 7 years

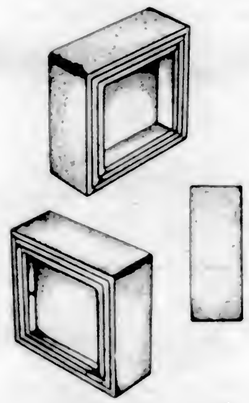
The ornamental design for a pipe holder, as shown.

106,801
DESIGN FOR A STORE FRONT
Hortense V. Lederer and Frederick Stanton, Chicago, Ill., assignors to Wimpy Grills of Illinois, Inc., Chicago, Ill., a corporation of Illinois
Application January 17, 1936, Serial No. 60,642
Term of patent 7 years



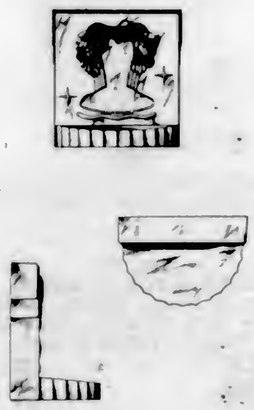
The ornamental design for a store front, as shown.

106,802
DESIGN FOR A TEXTILE FABRIC
Ben R. Levy, New York, N. Y.
Application September 30, 1937, Serial No. 71,881
Term of patent 3½ years



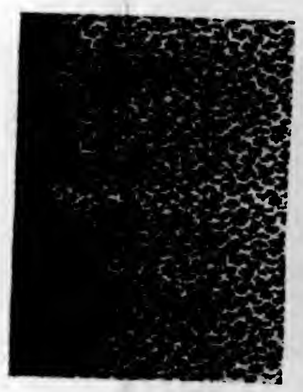
The ornamental design for a textile fabric, substantially as shown.

106,803
DESIGN FOR AN ELECTRIC LAMP FOR RANGES AND THE LIKE
Louis Ludwig, Brooklyn, N. Y.
Application January 8, 1937, Serial No. 66,951
Term of patent 7 years



The ornamental design for an electric lamp for ranges and the like, as shown.

106,804
DESIGN FOR A BOOKEND
William E. Mackelfresh, Jr., Chicago, Ill., assignor to Owens-Illinois Glass Company, Toledo, Ohio, a corporation of Ohio
Application August 25, 1937, Serial No. 71,322
Term of patent 14 years



The ornamental design for a bookend substantially as shown.

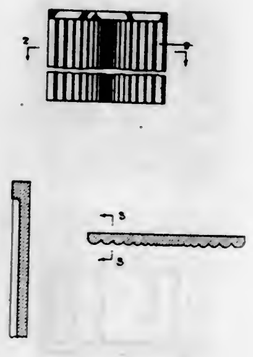
106,805
DESIGN FOR A BOOKEND
William E. Mackelfresh, Jr., Chicago, Ill., assignor to Owens-Illinois Glass Company, Toledo, Ohio, a corporation of Ohio
Application August 25, 1937, Serial No. 71,323
Term of patent 14 years

The ornamental design for a bookend substantially as shown.

106,806
DESIGN FOR A TEXTILE FABRIC
Jacques E. Maisch, New York, N. Y., assignor to National Fabrics Corporation, New York, N. Y., a corporation of Delaware
Application September 11, 1937, Serial No. 71,567
Term of patent 3½ years

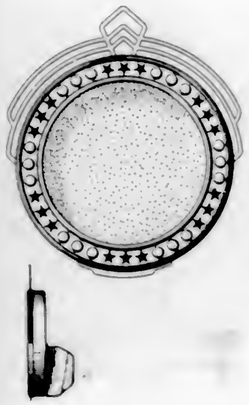
The ornamental design for a textile fabric substantially as shown and described.

106,807
DESIGN FOR A TEXTILE FABRIC
Jacques E. Maisch, New York, N. Y., assignor to National Fabrics Corporation, New York, N. Y., a corporation of Delaware
Application September 11, 1937, Serial No. 71,568
Term of patent 3½ years



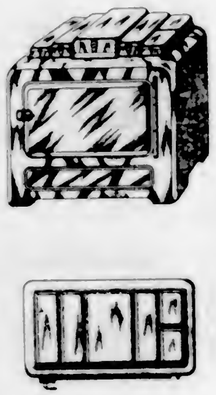
The ornamental design for a textile fabric substantially as shown and described.

106,808
DESIGN FOR AN UPPER BOWL COVER FOR A COFFEE BREWER OR SIMILAR ARTICLE
Edward Perlman, Niles Center, Ill.
Application August 11, 1937, Serial No. 71,009
Term of patent 7 years



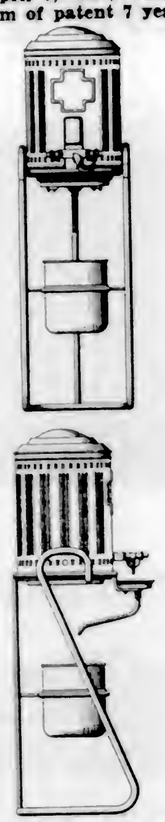
The ornamental design for an upper bowl cover for a coffee brewer or similar article as shown.

106,809
DESIGN FOR A TILE
Willis O. Prouty, Hermosa Beach, Calif.
Application March 6, 1937, Serial No. 68,048
Term of patent 14 years



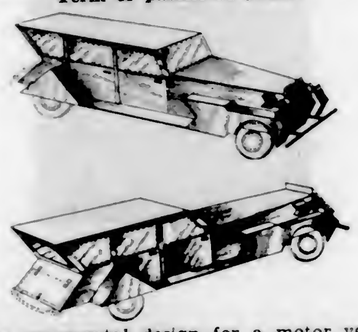
The ornamental design for a tile substantially as shown and described.

106,810
DESIGN FOR A DISPLAY MEDALLION OR SIMILAR ARTICLE
Benjamin Pucilloski, Cicero, Ill.
Application April 9, 1937, Serial No. 68,649
Term of patent 14 years



The ornamental design for a display medallion or similar article, substantially as shown and described.

106,811
DESIGN FOR A COMBINED REFRIGERATOR CASING AND CONTAINER UNIT
Kurt Speck, Irvington, N. J.
Application September 22, 1936, Serial No. 64,950
Term of patent 14 years



The ornamental design for a combined refrigerator casing and container unit as shown.

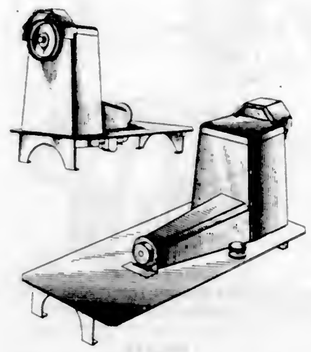
106,812
DESIGN FOR A COMBINED WATER COOLER AND DISPENSER
Guido J. Wiggenhorn, Los Angeles, Calif.
Application April 7, 1937, Serial No. 68,594
Term of patent 7 years

The ornamental design for a combined water cooler and dispenser, as shown.

106,813
DESIGN FOR A MOTOR VEHICLE
Jack Barofsky, Brooklyn, N. Y.
Application July 7, 1937, Serial No. 70,288
Term of patent 14 years

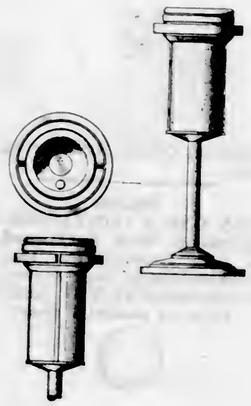
The ornamental design for a motor vehicle, as shown and described.

106,814
DESIGN FOR A JAR
Ivor Cordy, Washington, Pa., assignor to Hazel-Atlas Glass Company, Wheeling, W. Va., a corporation of West Virginia
Application September 16, 1937, Serial No. 71,651
Term of patent 14 years



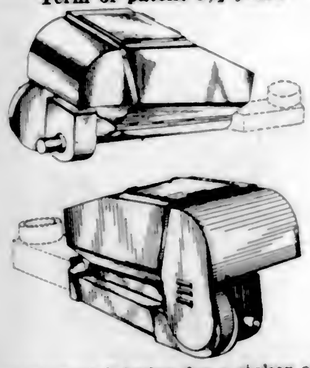
The ornamental design for a jar, as shown and described.

106,815
DESIGN FOR A DRESS
Benjamin Fried, New York, N. Y.
Application August 14, 1937, Serial No. 71,084
Term of patent 3½ years



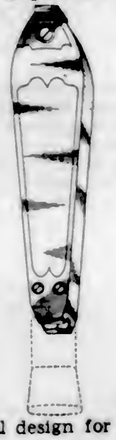
The ornamental design for a dress substantially as shown.

106,816
DESIGN FOR A PINKING MACHINE
Harry C. Herschman, Wheaton, Ill., assignor to Apex Pinking Machine, Inc., Chicago, Ill., a corporation of Illinois
Application July 2, 1937, Serial No. 70,239
Term of patent 14 years



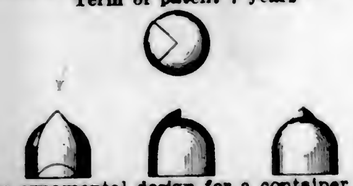
The ornamental design for a pinking machine, as shown.

106,817
DESIGN FOR A SMOKING STAND
Hervey L. MacCowan, Wilmette, Ill., assignor to The Nagel-Chase Mfg. Co., Chicago, Ill., a corporation of Illinois
Application July 22, 1937, Serial No. 70,585
Term of patent 7 years



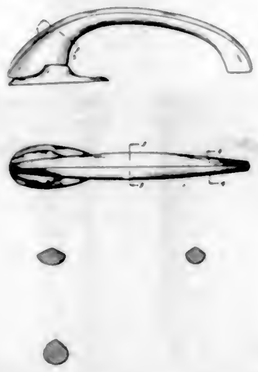
The ornamental design for a smoking stand, as shown.

106,818
DESIGN FOR A STOKER OR THE LIKE
John J. McGlone, Harvey, Ill., assignor to Whiting Corporation, Harvey, Ill., a corporation of Illinois
Application August 16, 1937, Serial No. 71,111
Term of patent 3½ years



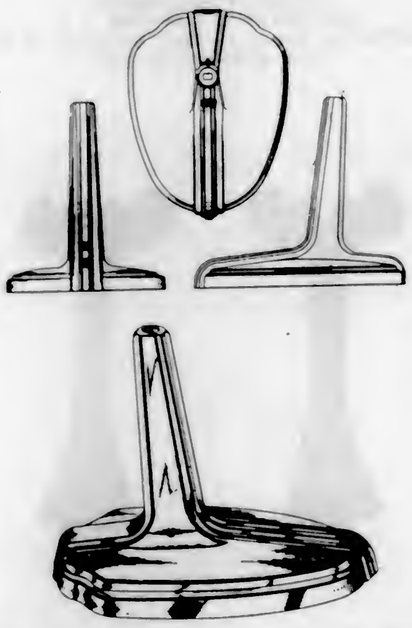
The ornamental design for a stoker or the like, substantially as shown and described.

106,819
DESIGN FOR A BRUSH
Felix R. Rapids, Chicago, Ill.
Application August 23, 1937, Serial No. 71,257
Term of patent 7 years



The ornamental design for a brush as shown and described.

106,820
DESIGN FOR A CONTAINER CAP
Edwin T. Reynolds, West Englewood, N. J., assignor to Lorr Laboratories, Inc., Paterson, N. J., a corporation of New Jersey
Application September 18, 1937, Serial No. 71,674
Term of patent 7 years

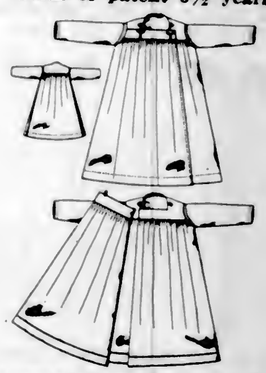


The ornamental design for a container cap as shown.

106,821
DESIGN FOR A DOOR HANDLE
Frederick C. Ruppel, Grand Rapids, Mich., assignor to W. B. Jarvis Company, Grand Rapids, Mich.
Application March 23, 1937, Serial No. 68,359
Term of patent 14 years

The ornamental design for a door handle, as shown.

106,822
DESIGN FOR A SUPPORTING BRACKET FOR ELECTRIC FANS
Abe O. Samuels, Rochester, N. Y., assignor to Samson-United Corporation, Rochester, N. Y.
Application February 6, 1937, Serial No. 67,494
Term of patent 14 years

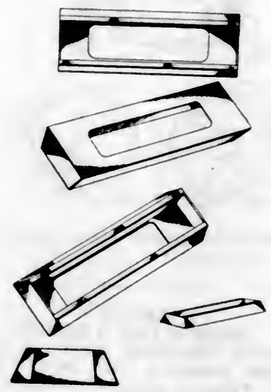


The ornamental design for a supporting bracket for electric fans, as shown.

106,823
DESIGN FOR A HEARING AID AMPLIFIER CASING
Sterling G. Sears, Garden City, N. Y., assignor to Dictograph Products Company, Inc., New York, N. Y., a corporation of Delaware
Application June 10, 1937, Serial No. 69,774
Term of patent 7 years

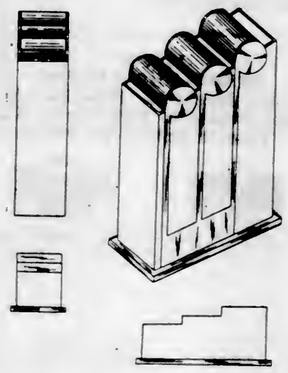
The ornamental design for a hearing aid amplifier casing, as shown.

106,824
DESIGN FOR A SMOCK
Loretta M. Cascardo, North Bergen, N. J.
Application May 8, 1937, Serial No. 69,230
Term of patent 3½ years



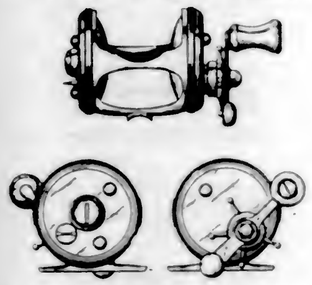
The ornamental design for a smock, as shown.

106,825
DESIGN FOR A DRESS ENSEMBLE
Elizabeth M. Ciccone, New York, N. Y.
Application September 15, 1937, Serial No. 71,625
Term of patent 3½ years



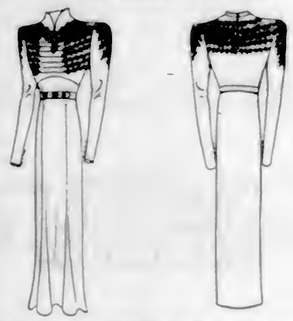
The ornamental design for a dress ensemble, substantially as shown and described.

106,826
DESIGN FOR A CARTON FOR TRANSPARENT DRINKING STRAWS
Otto W. Dieffenbach, Baltimore, Md.
Application June 10, 1935, Serial No. 57,211
Term of patent 14 years



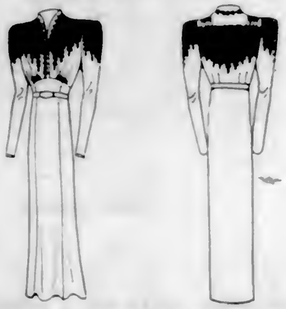
The ornamental design for a carton for transparent drinking straws, substantially as shown and described.

106,827
DESIGN FOR A COMBINED BOX AND DISPLAY STAND
Guy T. Gibson, New York, N. Y.
Application September 23, 1937, Serial No. 71,737
Term of patent 14 years



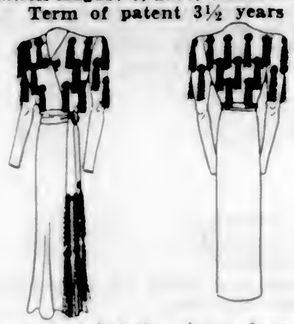
The ornamental design for a combined box and display stand, substantially as shown, and described.

106,828
DESIGN FOR A FISHING REEL
Louis Gurrieri and Salvatore Gurrieri, New York, N. Y.
Application March 24, 1937, Serial No. 68,390
Term of patent 3½ years



The ornamental design for a fishing reel substantially as shown.

106,829
DESIGN FOR A DRESS
Concetta Jaccarino, Brooklyn, N. Y.
Application August 6, 1937, Serial No. 70,882
Term of patent 3½ years

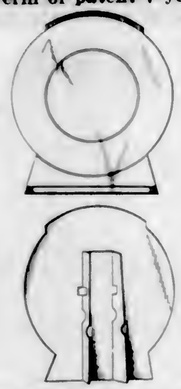


The ornamental design for a dress, substantially as shown and described.

106,830
DESIGN FOR A DRESS
Concetta Jaccarino, Brooklyn, N. Y.
Application August 6, 1937, Serial No. 70,883
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

106,831
DESIGN FOR A DRESS
Concetta Jaccarino, Brooklyn, N. Y.
Application August 6, 1937, Serial No. 70,884
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

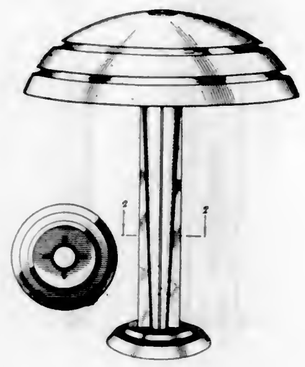
106,832
DESIGN FOR A DRESS
Concetta Jaccarino, Brooklyn, N. Y.
Application August 10, 1937, Serial No. 70,981
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

106,833
DESIGN FOR A DISPLAY STAND
Carl E. Lehman, Chicago, Ill.
Application December 1, 1936, Serial No. 66,242
Term of patent 7 years

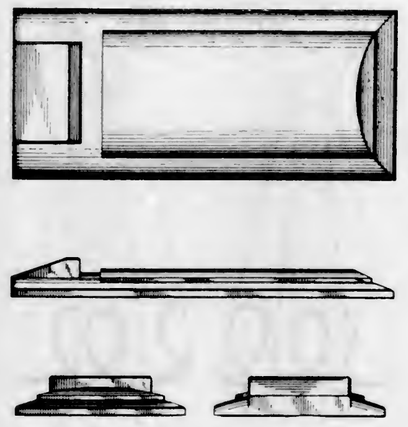
The ornamental design for a display stand as shown and described.

106,834
DESIGN FOR A DRESS OR SIMILAR ARTICLE
Abraham Morris, New York, N. Y.
Application September 25, 1937, Serial No. 71,790
Term of patent 3½ years



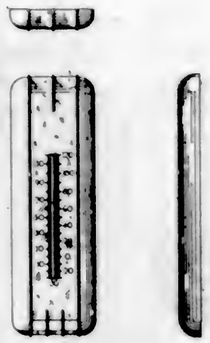
The ornamental design for a dress or similar article, substantially as shown.

106,835
DESIGN FOR A LAMP OR SIMILAR ARTICLE
Lemuel L. Stewart, Chicago, Ill., assignor to The Adlake Company, a corporation of Illinois
Application May 10, 1937, Serial No. 69,266
Term of patent 14 years



The ornamental design for a lamp or similar article, substantially as shown.

106,836
DESIGN FOR A READING LAMP OR SIMILAR ARTICLE
Lemuel L. Stewart, Chicago, Ill., assignor to The Adlake Company, a corporation of Illinois
Application May 10, 1937, Serial No. 69,267
Term of patent 14 years

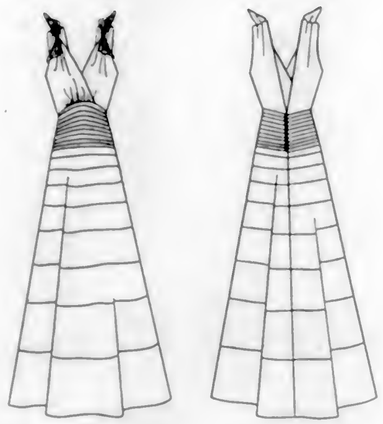


The ornamental design for a reading lamp or similar article, substantially as shown.

106,837
DESIGN FOR A COMBINED GRAVE PROTECTOR AND MARKER
George Oscar Sullivan, Pampa, Tex.
Application September 16, 1937, Serial No. 71,649
Term of patent 14 years

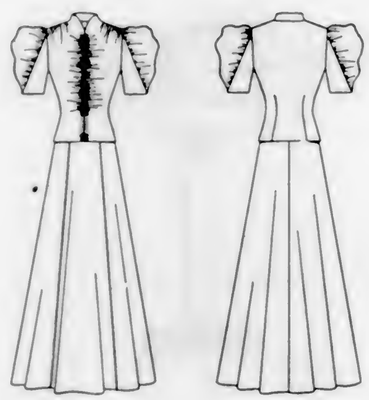
The ornamental design for a combined grave protector and marker, as shown.

106,838
DESIGN FOR A THERMOMETER
Ralph C. Wappner, Springfield, Ohio
Application June 14, 1937, Serial No. 69,839
Term of patent 14 years



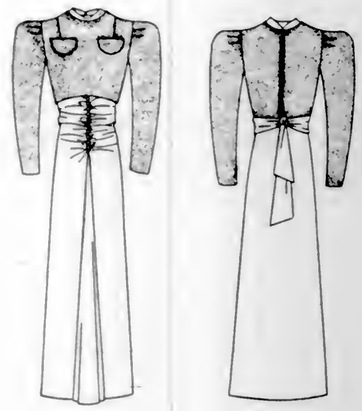
The ornamental design for a thermometer, substantially as shown.

106,839
DESIGN FOR A DRESS
Phil Cohen, New York, N. Y.
Application October 2, 1937, Serial No. 71,928
Term of patent 3½ years



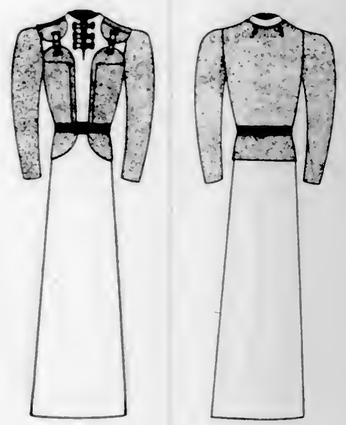
The ornamental design for a dress, substantially as shown.

106,840
DESIGN FOR A DRESS
Phil Cohen, New York, N. Y.
Application October 2, 1937, Serial No. 71,929
Term of patent 3½ years



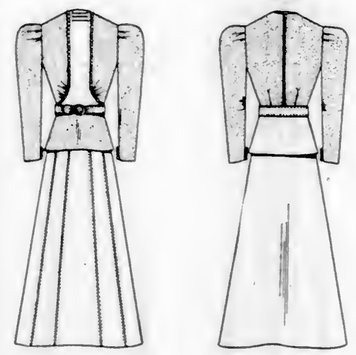
The ornamental design for a dress, substantially as shown, and described.

106,841
DESIGN FOR A DRESS
Phil Cohen, New York, N. Y.
Application October 6, 1937, Serial No. 71,983
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

106,842
DESIGN FOR A DRESS
Tora Coleman, New York, N. Y.
Application October 5, 1937, Serial No. 71,960
Term of patent 3½ years

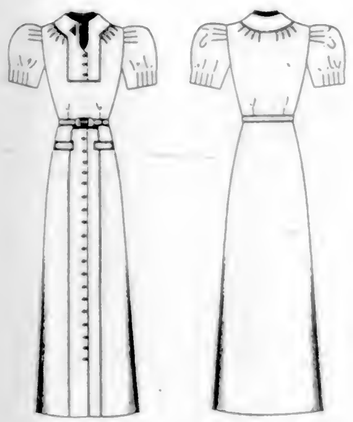


The ornamental design for a dress, substantially as shown.

106,843
DESIGN FOR A DRESS
Tora Coleman, New York, N. Y.
Application October 5, 1937, Serial No. 71,961
Term of patent 3½ years

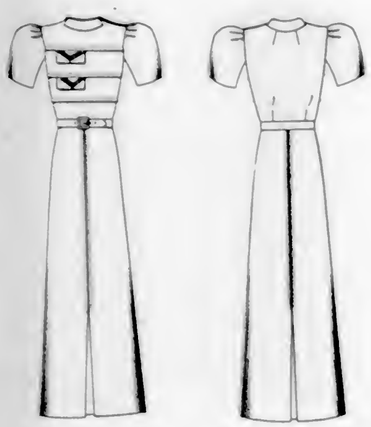
The ornamental design for a dress substantially as shown.

106,844
DESIGN FOR A DRESS
Isidor Kalmis, New York, N. Y.
Application October 1, 1937, Serial No. 71,912
Term of patent 3½ years



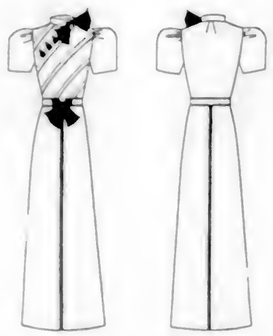
The ornamental design for a dress, substantially as shown, and described.

106,845
DESIGN FOR A DRESS
Max P. Kranz, New York, N. Y.
Application October 4, 1937, Serial No. 71,940
Term of patent 3½ years



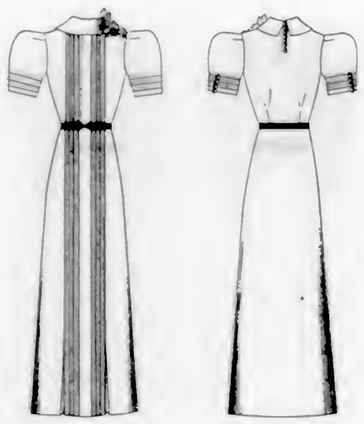
The ornamental design for a dress substantially as shown.

106,846
DESIGN FOR A DRESS
Max P. Kranz, New York, N. Y.
Application October 4, 1937, Serial No. 71,941
Term of patent 3½ years



The ornamental design for a dress substantially as shown.

106,847
DESIGN FOR A DRESS
Max P. Kranz, New York, N. Y.
Application October 4, 1937, Serial No. 71,942
Term of patent 3½ years



The ornamental design for a dress substantially as shown.

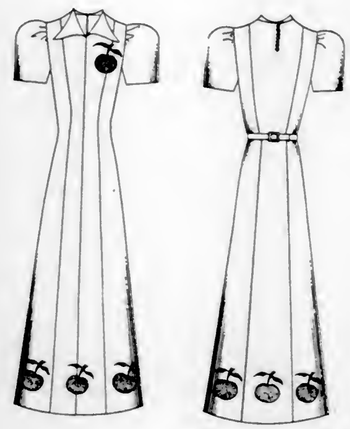
106,848
DESIGN FOR A DRESS
Max P. Kranz, New York, N. Y.
Application October 4, 1937, Serial No. 71,943
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

106,849
DESIGN FOR A DRESS
Max P. Kranz, New York, N. Y.
Application October 4, 1937, Serial No. 71,944
Term of patent 3½ years

The ornamental design for a dress substantially as shown.

106,850
DESIGN FOR A DRESS
Sidney J. Poster, New York, N. Y.
Application October 8, 1937, Serial No. 72,057
Term of patent 3½ years



The ornamental design for a dress, substantially as shown and described.

106,851
DESIGN FOR A DRESS
Philip Schlessel, New York, N. Y.
Application October 1, 1937, Serial No. 71,907
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

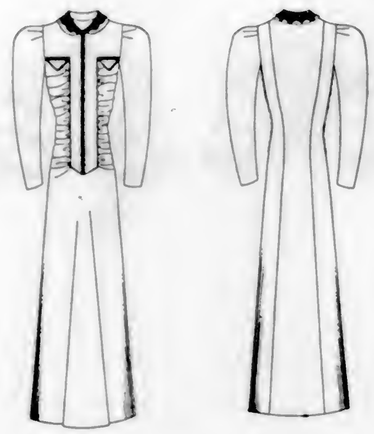
106,852
DESIGN FOR A DRESS
Harry M. Sterngold, New York, N. Y.
Application October 8, 1937, Serial No. 72,058
Term of patent 3½ years

The ornamental design for a dress substantially as shown and described.

106,853
DESIGN FOR AN AUTOMOBILE RADIO AERIAL
Carl M. Tichenor, Detroit, Mich.
Application March 22, 1937, Serial No. 68,350
Term of patent 7 years

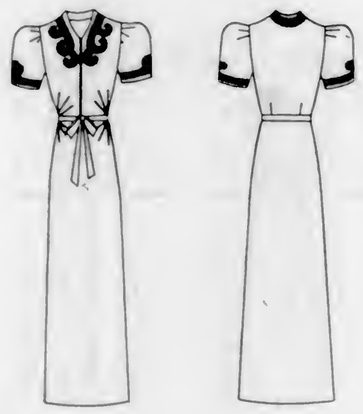
The ornamental design for an automobile radio aerial as shown.

106,854
DESIGN FOR AN AUTOMOBILE RADIO AERIAL
Carl M. Tichenor, Detroit, Mich.
Application March 22, 1937, Serial No. 68,352
Term of patent 7 years



The ornamental design for an automobile radio aerial, as shown.

106,855
DESIGN FOR A DRESS
Salvatore J. Velardi, New York, N. Y.
Application October 4, 1937, Serial No. 71,949
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

106,856
DESIGN FOR A DRESS
Harry Zinn, New York, N. Y.
Application October 8, 1937, Serial No. 72,059
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

106,857
DESIGN FOR A DRESS
Harry Zinn, New York, N. Y.
Application October 8, 1937, Serial No. 72,060
Term of patent 3½ years

The ornamental design for a dress, substantially as shown and described.

Patents Nos. 2,098,213 to 2,098,935

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office

Vol. 484—No. 2 TUESDAY, NOVEMBER 9, 1937 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 35 cents each.

PRINTED COPIES OF PATENTS are furnished by the Patent Office at 10 cents each. For the latter address the Commissioner of Patents, Washington, D. C.

CIRCULARS OF GENERAL INFORMATION concerning PATENTS or concerning TRADE-MARKS, PRINTS, and LABELS will be sent without cost on request to the Commissioner of Patents, Washington, D. C.

Interference Notice

U. S. PATENT OFFICE, *Washington, D. C., Oct. 8, 1937.*

John O. Lewis, his assigns or legal representatives, take notice:

An interference having been declared by this Office between the application for patent of Melvin M. Warren, R. F. D. #1, Geneva, Ohio, and patent granted March 10, 1936, No. 2,033,142, to John O. Lewis, 556 Sixteenth Street, Brooklyn, N. Y., and a notice of such declaration sent by registered mail to said Lewis at the said address having been returned by the post office as undeliverable, notice is hereby given that unless said Lewis, his assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the interference will be proceeded with as in case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

Notice of Cancellation

U. S. PATENT OFFICE, *Washington, D. C., Oct. 4, 1937.*

Patrick J. Dervin, his assigns or legal representatives take notice:

An application for cancellation having been filed in this Office by Chicago Pharmacal Co., Chicago, Ill., to effect the cancellation of trade-mark registration of Patrick J. Dervin, 219 East 28th Street, New York, N. Y., No. 155,404, dated May 30, 1922, and the notice of such proceeding sent by registered mail to the said Patrick J. Dervin at the said address having been returned by the post office undeliverable, notice is hereby given that unless said Patrick J. Dervin, his assigns or legal representatives, shall enter an appearance therein within thirty days from the first publication of this order the cancellation will be proceeded with as in the case of default. This notice will be published in the OFFICIAL GAZETTE for three consecutive weeks.

JUSTIN W. MACKLIN,
First Assistant Commissioner.

Disclaimers

1,871,383.—*Robert A. Miller*, Plainfield, N. J. SOUND REPRODUCING SYSTEM. Patent dated August 9, 1932. Disclaimer filed October 20, 1937, by the assignee, *Bell Telephone Laboratories, Incorporated.*

Hereby enters this disclaimer to claims 1, 2, 3, 6, and 7 of said Letters Patent.

1,981,726.—*Mervin Gentzler*, York, Pa. TIRE CHAIN. Patent dated November 20, 1934. Disclaimer filed October 2, 1937, by the assignee, *The McKay Company.*

Hereby enters its disclaimer to claim 9 of said patent.

2,038,128.—*Neil D. Preston*, Rochester, N. Y. CENTRALIZED TRAFFIC CONTROLLING SYSTEM. Patent dated April 21, 1936. Disclaimer filed October 23, 1937, by the assignee, *General Railway Signal Company.*

Hereby enters the following disclaimer: Disclaims from claim 26 any system, except wherein the "means in the control office manifesting lack of correspondence between said control lever and said indicating means" is initiated by the movement of the lever to a different position alone and regardless of any subsequent operation of the code communication system, and wherein said means "manifesting lack of correspondence" if once initiated remains in that condition regardless of any subsequent change in the position of the lever and until said "indicating means" is again actually operated by the code communication system.

Hereby disclaims claims 35 and 36.

2,042,670.—*Richard C. Leake*, Rochester, N. Y. CENTRALIZED TRAFFIC CONTROL SYSTEM. Patent dated June 2, 1936. Disclaimer filed October 23, 1937, by the assignee, *General Railway Signal Company.*

Hereby enters this disclaimer to claim 9 of said Letters Patent.

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Appeals for the District of Columbia

BATTERY PATENTS CORPORATION *v.* COE, COMMISSIONER OF PATENTS

No. 6,871. Decided September 13, 1937

1. DESIGNS—PATENTABILITY—INVENTION.

"In order for one to be entitled to a design patent the design which he has created must be the result of inventive skill."

2. SAME—SAME—SAME.

"Combining old forms so as to produce a new and ornamental design is not patentable when in the particular case the combining of the elements did not require invention."

3. SAME—SAME—COMBINED BICYCLE GUARD AND LAMP.

Design for a combined bicycle guard and lamp *Held* unpatentable over the prior art.

APPEAL from the District Court of the United States for the District of Columbia. Affirmed.

Mr. Nelson J. Jewett and *Mr. Russell Wiles* for Battery Patents Corporation.

Mr. R. F. Whitehead for the Commissioner of Patents.

Before MARTIN, Chief Justice, and ROBB, VAN ORSDEL, GRONER, and STEPHENS, Associate Justices.

STEPHENS, *A. J.:*

The appellant, hereinafter referred to as the plaintiff, is assignee of the application of one George S. Lewis seeking a design patent for a combined bicycle guard and lamp. The application was rejected by the Examiner, and on appeal the Board of Appeals sustained the Examiner's rejection. The plaintiff then filed a bill in equity in the United States District Court for the District of Columbia, under Section 4915 of the Revised Statutes (35 U. S. C. § 63), alleging the filing and due prosecution of the application and seeking a decree that the plaintiff is entitled to receive Letters Patent for the invention of Lewis, and that appellee, United States Commissioner of Patents, hereinafter referred to as the defendant, be authorized and directed to issue such patent. The defendant answered, admitting the filing and due prosecution of the application, and the rejection thereof, but asserting that the design was unpatentable, in the light of certain known designs mentioned below.

The defendant cited the following prior art: Humble, 1,069,550, August 5, 1913; Sawyer, Design, 92,114, April 24, 1934; Advertising Booklet of the Series 50 Buick Straight Eight for 1932, page 13, Model 32–56–S, Fender & Headlights.

At the trial below the patent application, the Examiner's statement, the decision of the Board of Appeals, and the prior art cited were in the usual course made a part of the record. Mr. Lewis testified in behalf of the plaintiff as to prior bicycle design, his design, and the widespread adoption thereof by bicycle manufacturers. No testimony was introduced for the defendant. At the close of the hearing, the trial court made the following findings and conclusions:

Findings of Fact

1. This is a suit brought under the provisions of Section 4915 R. S. (U. S. C., Title 35, Sec. 63) to authorize the Commissioner of Patents to issue a design patent to plaintiff on the application of George S. Lewis, plaintiff's assignor.

2. The application of Lewis discloses a design for a Combined Bicycle Guard and Lamp in which the guard for the front wheel of the bicycle is extended over the wheel and beyond the fork of the bicycle, a tear-drop shaped lamp being affixed to the guard between the fork and the end of the guard.

3. The patent to Humble, No. 1,069,550, discloses a bicycle having a guard for the rear wheel which extends over the upper portion of the wheel.

4. The design patent to Sawyer, No. 92,114, shows a design for a velocipede having a guard for the front wheel which is extended over the wheel and a substantial distance beyond the steering fork, a lamp being affixed to the guard between the fork and the end of the guard.

5. The Advertising Booklet of the Series 50 Buick Straight Eight for 1932, discloses on page 13 an automobile having a tear-drop shaped fender light.

6. In the early days of bicycle manufacture, it was the practice to have the front guard of the bicycle terminate even with the steering fork.

7. Later, the top of the front guard was advanced, in some cases, to a point in line with the truss rods.

8. At the time of the Lewis design involved herein, the front guard of bicycles had not been advanced beyond the truss rods, and it was the common practice of bicycle manufacturers to have the front guard terminate even with the steering fork, or even with the truss rods.

9. In the Lewis design, the guard was advanced a very substantial distance beyond the fork and beyond any usual location of the truss rods.

10. In the Lewis design, the lamp was placed between the portion of the guard even with the truss rods and the forward end of the guard, which extended a substantial distance ahead of the truss rods.

11. Plaintiff has sold two types of bicycles, one model, called the "Standard", being cheaper and not being provided with the Lewis design. In this model, the guard terminates even with the truss rods. In the second type, called the "De Luxe" model, the bicycle, which is otherwise the same as the "Standard", is provided with the elongated fender and lamp of the Lewis design. The bicycles have been sold in large numbers. Contrary to the usual experience, the more expensive model, equipped with the Lewis design, has outsold the cheaper model. Up to the present time, the higher priced bicycle has outsold the cheaper one in the proportion of 14 to 10.

12. Within a very short time after the new design appeared, it was copied by most of plaintiff's competitors.

13. One competitor employs a guard and a tear-drop lamp-shaped device on the guard, the lamp being a dummy.

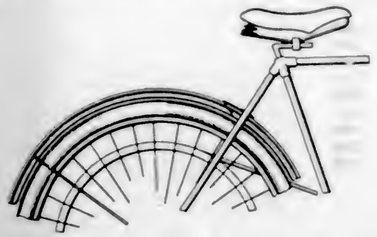
Conclusions of Law

1. In order that a design be patentable its creation must have involved the exercise of invention.

2. The design of the Lewis application does not disclose invention over the prior art as exhibited in the patents and publication in evidence.

3. The plaintiff is not entitled to the issuance of a patent on the application of its assignor, George S. Lewis.

4. The bill should be dismissed.



A decree was thereupon entered dismissing the bill of complaint, and this appeal was taken.

We have carefully examined the record and find that there is substantial evidence to support each of the findings of fact. The question in the case is whether the conclusion of law that the design of the Lewis application does not disclose invention is valid.

The Lewis design is illustrated by the following drawings:

The Humble patent shows a bicycle rear mudguard which has the same general configuration as the guard employed by the plaintiff in his design:

The Sawyer design shows a velocipede equipped with a front mudguard and lamp:

The Buick Advertising Booklet reveals an automobile which has a front fender with a parking light mounted thereon as shown in the following cut:

The parking light is the small lamp set on the fender in line with the rear of the headlight.

The tribunals of the Patent Office considered that the general configuration of the Lewis lamp and the form of mounting were shown by the Buick citation, and that nothing inventive resided in the guard element in view of Humble. The conclusion was that there was no invention in mounting a lamp of substantially the Buick form upon a guard the shape of which was old.

It may be admitted at the outset that small lamps of streamlined outline were known before the instant application, and that bicycle mudguards semicircular in shape were common.

[1] In order for one to be entitled to a design patent the design which he has created must be the result of inventive skill. The Supreme Court, in *Smith* v. *Whitman Saddle Co.*, 148 U. S. 674, 679 (1893) 63 O. G. 912, quoted from *Northrup* v. *Adams*, 12 O. G. 430, as follows:

"To entitle a party to the benefit of the act, in either case [mechanical patent or design], there must be originality, and the exercise of the inventive faculty. In the one, there must be novelty and utility; in the other, originality and beauty. Mere mechanical skill is insufficient. There must be something akin to genius—an effort of the brain as well as the hand. The adaptation of old devices or forms to new purposes, however convenient, useful or beautiful they may be in their new role, is not invention."

The Court continued:

The shape produced must be the result of industry, effort, genius or expense, and new and original as applied to articles of manufacture. *Foster* v. *Crossin*, 44 Fed. Rep. 62. The exercise of the inventive or originative faculty is required, and a person cannot be permitted to select an existing form and simply put it to a new use any more than he can be permitted to take a patent for the mere double use of a machine. If, however, the selection and adaptation of an existing form is more than the exercise of the imitative faculty and the result is in effect a new creation, the design may be patentable. [148 U. S. at 679.]

See also: *In re Sherman*, 35 App. D. C. 100, 154 O. G. 839, (1910); *Finley* v. *Coe*, 64 App. D. C. 276, 77 F.(2d) 399 (1935).

[2] Combining old forms so as to produce a new and ornamental design is not patentable when in the particular case the combining of the elements did not require invention. In *Knapp* v. *Will & Baumer Co.*, 273 Fed. 380, 384–85 (C. C. A. 2d, 1921), the court said:

What Knapp did involved no inventive act. He took an ordinary coach candle, with its bell shaped tip, and simply changed the column from a round one into a square one, leaving the bell-shaped tip the same as before. In converting a round column into a square one, he followed precisely the teachings of the art as previously set forth by Lamborn. He did what any ordinary workmen would have done—drew a round candle through a square mold in accordance with a common practice. Then he provided it with a self-fitting base in accordance with the teachings of the art since 1861.

It is true that invention may reside in a new combination of old elements. Every new combination of old elements, however, is not patentable.

And in *Imperial Glass Co.* v. *Heisey & Co.*, 294 Fed. 267, 269 (C. C. A. 6th, 1923), the court said:

While we do not question that patentable designs may arise from regrouping familiar forms and decorations, yet when all that was done was to take an existing piece of table glassware having these flutes, and substitute a slightly different form of flute already in common use on other articles of domestic table glassware, we are satisfied that there can be no patent monopoly. [Authorities cited.]

In *Steffens* v. *Steiner*, 232 Fed. 862 (C. C. A. 2d, 1916), the complainants had brought ten suits for infringement of ten design patents for cigar bands. The elements of the designs of the bands were all old although the particular patent designs were new. The District Judge had sustained the validity of three of the design patents, apparently feeling that he was bound by prior decisions in the circuit. He had said:

"The most important issue in these cases is the validity of the patents themselves, because the imitation is so deliberate, unblushing and minute as to require no consideration at all. Were the matter open to me de novo, I should hardly think that these groupings of elements so long familiar in the art, into such new combinations as are here presented, was beyond the competence of an ordinary designer, who for these purposes should be regarded as the test of invention. It is true that no such combinations are exactly presented before in the art, and indeed their literal novelty is unquestioned; but I cannot bring myself to think that the especial combinations were variations beyond what scores of designers could produce at will out of the materials at hand." [232 Fed. at 863.]

The Circuit Court of Appeals reversed, indicating that its prior decisions had been misconstrued by the lower court. The court said:

Invention may or may not reside in combining a multitude of old design elements into one unitary design. Whether or not invention is involved in any particular case of that kind must depend upon the novelty of the unitary and resultant design and the circumstances of the case.

The question in the case at bar is not whether a design patent can be sustained, although each separate element in the design may be old, but it is whether what has been done in assembling the old elements in the new designs rose in these particular cases to the level of invention. What has been done in the patents in suit has been to vary slightly the shape and disposition of the otherwise old design elements or surface ornamentation of the cigar bands. The test of invention by which the court below decided the case was stated as follows:

"This test will not allow validity to a patent for immaterial changes which do not differentiate from the prior art enough to be distinguishable, but will allow any new combination of old elements, even though it took no invention beyond that of a skilled designer."

In laying down the above test the court below has been led into error. To sustain a design patent the design must involve something more than mere mechanical skill. There must be invention. [232 Fed. at 864–65.]

On the other hand, although all the component parts of a design may be old in the art, combining them into a new and ornamental design may have required inventive genius. Indeed many, if not most, of the elements of design are long known and familiar. As was said by Augustus Hand, then District Judge, in *Friedley-Voshardt Co.* v. *Reliance Metal Spinning Co.*, 238 Fed. 800, 800–01 (S. D. N. Y. 1916):

There is no doubt that a design patent, like every other, requires invention, and, if the design in question for a gas and electric fixture known as a shower pan is a mere aggregation of well-known elements which could be assembled without ingenuity or artistic skill, it cannot be regarded as one showing invention. It is to be remembered that ornaments resulting from the varied juxtaposition of curves and angles, like the musical combinations resulting from the sequence of notes and chords, all contain certain intervals—ornaments intervals of space, music intervals of sound—which are traditional and well known. It is difficult, if not impossible, after years of development, to imagine any article of ornament or any production of music of which this is not true. It is in the arrangement, or, to use the technical term of the patent law, the combination, of elements, and probably at this late day in that alone, that originality and aesthetic skill may be evidenced. Mr. Ainsworth, the designer of Caldwell & Co., well expressed this idea when he said in his testimony at the trial:

"• • • All motives are old. We have inherited them, and we combine them in such a way as to produce an artistic result and a new result; combining them in such a way as to make proper intervals in the spacing of ornaments and the proper emphasis of different ornaments, and to keep the play of light and shade so as to make on the whole a pleasing design, and its merit would depend a great deal on how thoughtful and how different it was from the stereotyped combinations."

This court, in *Application of Grigsby*, 55 App. D. C. 294, 5 F.(2d) 117 (1925), held that a design patent should be issued for a triple-curved glare visor for automobiles although the prior art showed visors with plain arcuate curves and others with ogee curves. The patentability of an inventive combination of old elements is well expressed in *Graff, Washbourne & Dunn* v. *Webster*, 195 Fed. 522, 523 (C. C. A. 2d, 1912), where the court said:

It will simplify the discussion if it be at once admitted that each element of the patented designs, considered separately, was old and that sometimes two or more of them appear combined in the prior art. This does not invalidate the patents, unless it appears that they were so assembled as to form the designs of the patents. Indeed, it is manifest that a skillful designer, with the Graff dish before him, could construct a new and ornate design containing every element of that dish and at the same time presenting a totally different impression to the eye of the ordinary beholder. It is the design as a whole and not the segregated scrolls, leaves, flowers and forms which are united to produce the general effect, which must be considered. The situation in this respect is analogous to machines made up of a combination of old elements.

The machine produces a new result, the design a new impression upon the eye. To refuse patentability to a design because the separate elements are old, would be tantamount to denying originality to "The Lion of Lucerne" because other sculptors before Thorwaldsen had carved lions from stone. It would relegate "The Angelus" to obscurity because other artists before Millet had painted peasants at work in the harvest field.

See also *Pfeffer* v. *Western Doll Mfg. Co.*, 283 Fed. 966 (C. C. A. 7th, 1922); *Protex Signal Co.* v. *Feniger*, 11 F.(2d) 43 (C. C. A. 6th, 1926).

It has been settled since the case of *Gorham Company* v. *White*, 14 Wall. 511 (U. S. 1871), that the general effect of a design is controlling, rather than minor differences which alter the design without changing its appearance in the eyes of the ordinary observer. Also this court, in the case of *In re Schraubstadter*, 26 App. D. C. 331 (1905), indicated that in determining the question of the patentability of a later design it is not necessary to find that it infringes an earlier one in order to reach the conclusion that the later design lacks patentability. That is to say, a later design may in its general effect be so different from an earlier one as not to infringe it, and still the earlier may so anticipate the later in idea as to preclude invention.

We are thus confronted with the question whether, conceding the elements of the Lewis design to be old, but its precise combination to be new, the design required inventive genius.

[3] We are of opinion that nothing in the prior art anticipates the Lewis design in totality of ornamental effect. The Humble rear mudguard while curved concentric to the wheel, unlike the Lewis mudguard has no lamp combined with it. The Sawyer lamp is not streamlined and is differently mounted upon a guard of very different appearance. The total effect of the Sawyer combination is doubtfully ornamental at all, at least from the standpoint of present-day vehicle designs. Bicycles made prior to the Lewis design disclose, as shown by the record, a very short front guard, extending little, if any, beyond a point directly above the axle of the front wheel, and a non-streamlined lamp placed close to the upright supporting the handlebars. The Lewis design, it is true, combines a front lamp on a front guard concentrically curved. But it adds a further forward extension of the guard and it mounts and angles and streamlines the lamp upon and in relation to the guard in a manner which we think produces an ornamental effect wholly new and very pleasing.

Nothing in the record is at all like the Lewis design in general appearance except the lamp and fender combination shown in the Buick Advertising Booklet, and while this has an ornamental aspect, again we think it is materially different from the Lewis design. The Buick parking lamp, although streamlined in form, is tiny in proportion to the fender upon which it is mounted, in comparison with the Lewis lamp, and the Lewis fender; and in addition is mounted differently, that is, horizontally, whereas the Lewis lamp is tilted forward slightly off the horizontal. The Buick fender is a flat arc, almost tangential to the wheel; the Lewis guard is semicircular and concentric. Even if these differences between the Buick and Lewis designs may be said to be in and of themselves small, still the effect, in the Lewis design, is a material change of general appearance—which may amount to invention. *Application of Grigsby*, supra. Although the Buick lamp blends into the form of the forepart of the automobile and fender, it produces no especial effect of its own. The Lewis lamp as mounted produces the impression of speed and forward motion. In the plaintiff's brief before the Board of Appeals this effect is likened to the impression given by a flag in the bow of a boat, or by an automobile radiator ornament in the shape of an eagle with spread wings. The analogies are apt.

We think it required more than the skill of the ordinary designer to take the disassociated elements of the prior art and combine them in a design so new and so pleasing. The conclusion we reach is confirmed by the prompt and widespread adoption of the Lewis design. The record reveals that the competitors of the plaintiff were quick to perceive the merits of the combined lamp and guard of Lewis, and that bicycles equipped with it outsold less expensive machines made without such equipment. The record shows that by 1936 the use of the Lewis design was so widespread that a bicycle appliance manufacturer pictured in his advertising, as a typical modern bicycle, one having such a front guard and light. Prompt and widespread adoption is recognized by the courts as evidence of invention. See *Standard Match Corporation* v. *Bell Mach. Co.*, 83 F.(2d) 365, 367 (C. C. A. 7th, 1936):

> Whether a design which is novel and ornamental is entitled to coverage by a design patent depends to a large degree upon the reception which those for whom it is made, accord it.

We are aware that this court has said that in case of a serious doubt in the mind of the court after a careful review of the evidence, the doubt should be resolved in favor of the one seeking a patent. *Application of Drew*, 55 App. D. C. 291 4 F.(2d) 958 (1925); *In re Glafcke*, 51 App. D. C. 204, 277 Fed. 603 (1922); *In re Davidson*, 56 App. D. C. 279, 12 F.(2d) 814 (1926). It has also said that where there are, as here, concurring decisions of the patent tribunals, the court should be convinced beyond a reasonable doubt before reversing them that if a patent had been granted the court would upon the same record sustain it under attack. We are not doubtful under either of these rules that the application in the instant case should have been granted.

The decree of the District Court is

Reversed.

VAN ORSDEL, *A. J.*, sat during the argument of this case, but died before the opinion was prepared.

MARTIN, *C. J.*, dissenting:

The applicant, George S. Lewis, filed in the Patent Office an application for a patent for a design for a bicycle guard and lamp. He afterwards assigned his right and interest in the application to the present appellant, Battery Patents Corporation. An illustration of the design in question appears in the majority opinion of the court.

The application was considered and denied by the Primary Examiner in the Patent Office upon the following references: Humble, 1,069,550, August 5, 1913; Sawyer (Design), 92,114, April 24, 1934; Advertising Booklet of the Series 50 Buick Straight Eight for 1932, page 13, Model 32–56–S, fender and headlights.

The Examiner pointed out that the same configuration of a lamp on a fender is shown to be old in the catalogue citation picturing the Buick automobile. He also called attention to the Humble patent, showing the transverse or cross-sectional configuration of the guard embodied in the applicant's design. He further cited the design patent to Sawyer, disclosing a lamp upon the front wheel of a tricycle in a relation generally similar to that of applicant's. An appeal was taken from the Examiner's final ruling to the Board of Appeals, which held that the difference between the shape of applicant's guard and lamp and that of the Buick fender and lamp is not such as to constitute invention; that the general configuration of the bicycle guard, particularly with a lamp thereon, is shown to be old. The Board affirmed the decision of the Examiner.

Whereupon the appellant, as assignee of the applicant, filed suit in the District Court of the United States for the District of Columbia, under Sec. 4915, R. S. (Sec. 63, Tit. 35, U. S. C.), making the Commissioner of Patents party defendant and praying that the Commissioner be directed to issue a patent to plaintiff upon the application.

The case was tried before the lower court, which entered findings of fact and conclusions of law in the record, holding that the design of the Lewis application does not disclose invention over the prior art as exhibited in the patents and publication in evidence; that the appellant is not entitled to the issuance of a patent on the application of its assignor, Lewis. The court thereupon dismissed appellant's bill, with costs, and from that decree this appeal is taken.

It thus appears that the Lewis application was denied by the unanimous rulings of the Patent Office tribunals, and that their holding was sustained by that of the lower court. It is clear, therefore, that the decision of the lower court should not be reversed unless it appears that it is clearly and obviously erroneous.

I am of the opinion that the decree of the lower court should be affirmed.

A reference to the Sawyer patent, supra, shows a velocipede in which the mudguard is extended beyond what corresponds to the fork of the bicycle, that is, the portion of the frame to which the handle bar is fastened, and has a lamp placed on the guard in a position almost exactly the same as that shown in appellant's design. A velocipede is a vehicle of the same general character as a bicycle, and obviously there would be no invention in transferring any given design of guard and lamp from a velocipede to a bicycle. It must be remembered that the question here is not one of structure for functional purposes, but a question of design and appearance.

The picture of the Buick automobile appearing in the majority opinion is a reproduction of a cut in a Buick catalogue, showing, at the left hand side thereof, an automobile parking lamp of substantially the same shape as the lamp shown in the application of Lewis. There can be no invention in selecting from the prior art, where it had been used in a similar situation, a lamp of this shape and placing it on a bicycle mudguard in place of the lamp shown in the Sawyer patent. The Humble patent discloses a mudguard of substantially semicircular shape, similar to that shown in the Lewis application with a lamp thereon.

It seems clear that the Lewis design is the result of mere mechanical combination, and does not involve the exercise of invention. The elements comprising it are all old and were used for purposes similar to applicant's construction, serving no other purpose and presenting a substantially similar appearance.

The statute (Sec. 73, Tit. 35, U. S. C.) specifically provides that any person who has *invented* any new, original and ornamental design for an article of manufacture may obtain a patent therefor. In order to be patentable, a design must be the product of the inventive faculty, as distinguished from mere mechanical skill. In the case of *Smith* v. *Whitman Saddle Company*, 148 U. S. 674, 63 O. G. 912, the Supreme Court of the United States quoted with approval the language of Mr. Justice Brown in *Northup* v. *Adams*, 12 O. G. 430, as follows (p. 679):

> To entitle a party to the benefit of the act, in either case, there must be originality, and the exercise of the inventive faculty. • • • Mere mechanical skill is insufficient. There must be something akin to genius—an effort of the brain as well as the hand. The adaptation of old devices or forms to new purposes, however convenient, useful or beautiful they may be in their new role, is not invention.

See also: *Nat Lewis Purses* v. *Carole Bags*, 83 F.(2d) 475, 476 (C. C. A. 2d, 1936); *A. O. Smith Corp.* v. *Petroleum Iron Works Co.*, 73 F.(2d) 531, 538 (C. C. A. 6th, 1934); *Berlinger* v. *Busch Jewelry Co.*, 48 F.(2d) 812, 813 (C. C. A. 2d, 1931); *In re Walter*, 39 F.(2d) 724, 725 (C. C. & P. A., 1930); *Strause Gas Iron Co.* v. *William M. Crane Co.*, 235 Fed. 126, 131 (C. C. A. 2d, 1916); *Fox* v. *Spiegel*, 50 F.(2d) 195, 196–7 (D. C. Conn., 1931).

It seems clear that in the design here involved the combination of elements, old in themselves, in a manner essentially similar to their former functions, and not differing substantially from their former appearance, is merely mechanical and does not attain to the dignity of invention.

In my opinion, therefore, the decree of the lower court should be affirmed.

U. S. Court of Customs and Patent Appeals

WILLIAMS OIL-O-MATIC HEATING CORPORATION

v.

UNITED FURNACE ENGINEERING COMPANY, INC.

No. 3,782. Decided March 29, 1937

[88 F.(2d) 719]

TRADE-MARKS—SIMILARITY—"MELTOMAT" FOR MELTING FURNACES AND "OIL-O-MATIC" FOR LIQUID FUEL BURNING DEVICES.

The term "Meltomat" as applied to melting furnaces *Held* not confusingly similar to "Oil-O-Matic" as applied to liquid fuel burning devices in view of the differences between the marks and the quite considerable differences between the use of the devices of the respective parties.

APPEAL from the Patent Office. Affirmed.

Mr. Langdon Moore and *Mr. James Atkins* for Williams Oil-O-Matic Heating Corporation.

Mr. M. E. Jones and *Mr. William G. Doolittle* for United Furnace Engineering Company, Inc.

GRAHAM, *P. J.*:

The appellee has filed an application in the United States Patent Office for registration of the trade-mark "Meltomat" to be used in connection with the sale of melting or similar furnaces, in Class 34, heating, lighting, and ventilating apparatus, not including electrical apparatus. It is alleged the mark has been used continuously in said business since about January 10, 1933.

The appellant filed notice of opposition to said registration, alleging that it was engaged in the business of manufacturing and selling liquid fuel burning devices. It further appears from the notice of opposition and the stipulated facts that in connection with said business it had used the trade-mark "Oil-O-Matic", which it had adopted on or about January 15, 1920, and which had been used continuously thereafter until the present time; that the opposer also had used the trade-mark "Dist-O-Matic" as a trade-mark upon liquid fuel burning devices since March 9, 1928, and the trade-mark "Gas-O-Matic" since on or about February 28, 1929, on automatically electrically controlled and operated fuel heating systems; that the plant investment of the opposer is very large, together with its advertising expenditure, and that it has acquired a valuable good will, and that it believes the registration of the mark "Meltomat" would tend to cause confusion in the mind of the purchasing public with the goods of the opposer, and would result in damage and injury.

The parties agreed upon stipulated testimony. On the part of the appellee, it is agreed that the witnesses would testify that the mark "Meltomat" was adopted for the manufacture and sale of melting furnaces particularly designed for the melting

and conversion of non-ferrous metals; that these furnaces so manufactured comprised oil burning, crucible-using melting machines, and that the name "Meltomat" has been used since on or about January 10, 1933, continuously. On the part of the opposer, in addition to the facts already stated, it is stipulated that the witnesses would testify that the trade in the opposer's device has become very large; it is also stipulated, on the part of the opposer, that as early as 1921 Oil-O-Matic oil burners have been used in melting furnaces for stereotype by newspaper publishers, and are being used for that purpose at the present time. It also appears that during the summer of 1927, three Oil-O-Matic burners were installed, and successfully used, in connection with a gold mine at Idaho Springs, Colorado. One burner was used in the furnace to melt the ore and smelt it into its various component parts, and the other two were used in retorts to drive off the sulphur and reduce the ore to a concentrate ready for shipment.

The questions arising in the case are as to the same descriptive character of the goods, and the confusing similarity of the trade-marks. The marks are different in many respects. The marks of the opposer end with the two syllables "Matic", which, in themselves, have a distinctive sound. It will be borne in mind that the distinctive goods which are involved here are costly, and involve close discrimination in buying. This feature we called attention to in the recent case of *Williams Oil-O-Matic Heating Corp.* v. *Edward P. Bliss, Jr.*, 19 C. C. P. A. (Patents) 821, 54 F.(2d) 430, 416 O. G. 537. Where such discrimination in buying is exercised, there is not so much probability of confusion as in ordinary cases where less discrimination is exercised.

Again, the devices, while both are used for heating, are much different in their other ordinary uses. The ordinary use of the Williams device is for the heating of buildings, while the "Meltomat" devices are used for a much rarer purpose, namely, smelting or melting metals. It is true that it is shown that the Oil-O-Matic and Dist-O-Matic devices are sometimes used for stereotype heaters, and on one rare occasion for smelting purposes, but this is an exceptional use, and one which it appears is not the use by which these devices are commonly known.

While we are of opinion that the heating devices of the appellant and the opposer might broadly be considered to be within the same general class, we are nevertheless of the opinion that because of the considerable distinction between the sound of the marks, their number of syllables, and difference in spelling, and the quite considerable difference in the general use of the devices, that the opposition was properly overruled, and that the appellee is entitled to registration and the opposition should be dismissed.

Many authorities on this subject are collated in our recent case of *Meredith Publishing Co.* v. *Scott & Sons Co.* (Suit No. 3683), 24 C. C. P. A. (Patents) —, 88 F.(2d) 324.

The decision of the Commissioner of Patents is affirmed.

Affirmed.

HATFIELD, *J.*, did not participate in this case.

U. S. Court of Customs and Patent Appeals

FISHBURN ET AL. *v.* VINCENT

No. 3,753. Decided March 29, 1937

[88 F.(2d) 711]

1. INTERFERENCE—RIGHT OF PARTY TO MAKE CLAIMS—MOTION TO DISSOLVE FILED LATE.

Where a party to an interference does not file a motion to dissolve the interference on the ground that his opponent can not make the claims, until after the motion period has expired and gives no sufficient reason for the delay, he may not be heard on an appeal from an award of priority, to argue that question.

2. SAME—PRIORITY.

Record reviewed and *Held* that priority of invention was properly awarded to V., the senior party.

APPEAL from the Patent Office. Affirmed.

Messrs. Hood & Hahn, Mr. William P. Hahn, and *Mr. Charles M. Thomas* for Fishburn and Robbins.

Messrs. Rector, Hibben, Davis & Macauley, Mr. Harry W. Lindsey, Jr., Mr. Francis G. Cole, and *Mr. Milton Tibbetts* for Vincent.

HATFIELD, *J.*:

This is an appeal in an interference proceeding from the decision of the Board of Appeals of the United States Patent Office affirming the decision of the Examiner of Interferences awarding priority of invention of the subject-matter in issue to appellee.

The counts of the interference are Nos. 1 to 4, inclusive, of which count 1 is illustrative. It reads:

Count 1. A synchronizer comprising, in combination with a driving and a driven member, a clutch member mounted on one of said members having a friction clutch portion and a positive clutch portion, said positive clutch portion having radial teeth, a hub rotatively fixed on and axially movable on the other member having a friction clutch portion *and radial positive clutch teeth in end to end relation with the radial clutch teeth of said first mentioned clutch portion*, an axially movable rotatively fixed locking member surrounding said hub for bridging the teeth of the two clutch members to lock the two clutch members together and means for resiliently locking said locking member and hub together axially. [Italics ours.]

Appellants' application was filed December 22, 1930, Serial No. 504,084.

Appellee's application was filed July 10, 1930, Serial No. 466,949.

Appellants are the junior parties, and the burden is upon them to establish priority of invention by a preponderance of the evidence.

The Examiner of Interferences held that the evidence submitted by appellants was not sufficient to warrant a holding that they had either conceived or reduced the invention to practice prior to appellee's filing date. The Examiner then stated the grounds—five in number—upon which appellants sought to prevail over appellee. However, only two of those grounds are before us for consideration. It is unnecessary, therefore, to refer to the Examiner's decision on other points presented to him.

With reference to the first ground before us, upon which appellants sought to prevail over appellee, namely, that appellee disclaimed in his testimony the subject-matter of the counts involved in the interference, the Examiner of Interferences said:

The contention that Vincent has disclaimed the invention is based solely upon an answer given by Vincent to a question put on cross-examination with respect to the disclosure of his application. The question and answer read as follows:

XQ. 13. And you would, therefore, say that the radial positive clutch teeth, 35, on the hub, are not in end to end relation with the radial positive clutch teeth, 38, isn't that correct?

A. Correct.

It may be noted that each of the issue counts specifies that the radial positive clutch teeth on the hub are in end to end relation with the positive clutch teeth 35 on the driving shaft.

If Vincent's statement, quoted above, was the only evidence as to the disclosure of his application, this contention on the part of Fishburn et al., might carry some weight, but the application is a Patent Office record and the Office is the sole judge as to what is disclosed therein. It is well settled that testimony to explain the disclosure of pending applications is inadmissible. *Cooper* v. *Downing*, 1916, C. D. [3] 4. And no reason is seen for making an exception in this case. The counts are either supported by the Vincent application or they are not, and nothing that Vincent or anyone else can say will alter that fact. It may be noted that the present situation differs from those in the cases cited by Fishburn et al., which involve an unqualified disclaimer of the invention set forth in the counts, or a deliberate and formal admission that such invention was not disclosed in the application.

Accordingly it is held that Vincent has not disclaimed the invention in issue.

The second ground before us, that is, that appellee failed to disclose the subject-matter of the counts of the interference in his involved application, was discussed by the Examiner of Interferences as follows:

Under the authority of *Isom* v. *Dubbs*, 1928, C. D. 102 and *Dreyfus* v. *Lilienfeld*, 1931, C. D. 681, Fishburn et al., cannot be held to urge this contention since they have failed to raise it during *the motion period by motion to dissolve*. While Fishburn *did bring a motion to dissolve after testimony was taken*, this motion was dismissed on November 7, 1934, on the ground that insufficient excuse was alleged for the delay in filing the same. No petition was taken from this dismissal. [Italics ours.]

While as pointed out in *Smith* v. *Foley*, 1918 [1908], C. D. 210, the Examiner of Interferences can consider the question of disclosure on his own motion, it is not believed that the circumstances of this case justify such action. Without passing upon the question as to whether Vincent discloses teeth on the hub member which are sufficiently in end to end relation with the positive clutch teeth 35 to support the issue counts, it may be noted that the Vincent Exhibits A and B and the testimony with respect thereto establish conception by Vincent of a structure which unquestionably supports the issue counts as early as October, 1928. Note also that Vincent's patent, 1,901,713, which was copending with his present application, also discloses a structure clearly within the issue. [Vincent's Exhibit R. A reissue application "of Letters Patent Number 1,901,713, dated March 14, 1933"]. In view of these circumstances it is apparent that Vincent is the first inventor of the subject-matter in issue and *could have taken steps to amend the issue or substitute a reissue of his aforesaid patent for his present application if he had received timely notice of this ground of attack*. This is just what was done by Vincent when Fishburn et al., filed his motion to dissolve after the taking of testimony; but the motion by Vincent under rule 109 was dismissed in view of the dismissal of the Fishburn et al., motion to dissolve. [Italics ours.]

Accordingly it is held that for the purpose of the present controversy it must be presumed that the issue counts are supported by the Vincent application.

The Examiner of Interferences held that as appellants, the junior parties, failed to overcome the filing date of the senior party, Vincent, priority of invention should be awarded the latter.

In affirming the decision of the Examiner of Interferences, the Board of Appeals stated that appellee had not disclaimed the invention by his testimony, referred to in the Examiner's decision, and held that as appellant failed to file a motion to dissolve the interference on the ground that appellee's application did not disclose the invention defined by the appealed counts during the motion period, as provided in rule 122 of the Rules of Practice in the United States Patent Office, that issue was not before the tribunals of the Patent Office.

In concluding its decision, the Board said:

The question as to whether the counts can or cannot properly be made in the Vincent application involved in the interference or in his reissue is one which, in our opinion, may properly be left to the consideration of the Primary Examiner. We believe that it is best for us to confine our decision to the question before us.

In this court, counsel for appellants state in their brief under the heading "questions involved", that—

The sole question involved in this appeal may be summarized as follows:

(1) Does Vincent's admission in the testimony that his involved application fails to disclose the subject matter of the counts of the interference constitute a disclaimer of his right to the claimed invention?

The Board of Appeals substantially followed the decision of the Examiner of Interferences on this question.

The Examiner of Interferences erroneously refused to accept the sworn statement as a disclaimer. Apparently his view was due to the belief that although the involved application failed to illustrate the claimed invention, Vincent, nevertheless, was entitled to an award of priority because of certain extraneous proofs alleged to establish conception prior to Fishburn's date. It is immaterial what Vincent may have conceived. To receive an award of priority, the involved application must carry a clear and complete disclosure of the claimed invention.

(2) Does Vincent's sworn declaration that the subject matter of the counts is not supported by the involved disclosure constitute a binding admission against interest?

The admission or declaration is made by the principal and is, therefore, admissible and binding on him.

and, under the heading "errors relied on", that—

The errors relied on are:

(1) That the Board erred in holding that the testimony of Vincent does not constitute a disclaimer of the subject matter of the counts of the interference.

(2) In following the decision of the Examiner of Interferences and holding that the Vincent application discloses the subject matter of the counts of the interference and awarding priority to Vincent.

Accordingly, we will limit our discussion to the "questions involved", and the two errors relied upon by counsel for appellants.

The first contention of counsel for appellants is that appellee disclaimed the invention by the following testimony given on cross-examination: "XQ. 135. And you would, therefore, say that the radial positive clutch teeth, 35, on the hub, are not in end to end relation with the radial positive clutch teeth, 38, isn't that correct? A. Correct."

It is clear from other testimony given by appellee that he had no intention of admitting that his application failed to disclose the subject-matter of the counts of the interference, or that he intended to disclaim the involved invention.

It seems to have been the practice in the Patent Office over a period of many years to reject, except in very exceptional cases, testimony offered for the purpose of explaining the disclosure of a pending application. See *Cooper* v. *Downing*, 1916 C. D. 3, 4, wherein the Commissioner of Patents made the following statement:

It is not the practice of this office to permit expert testimony to explain what an application discloses. The tribunals of this office are presumed to be sufficiently expert to understand the technical terms, and they are in

possession of information as to the state of the art upon which any alleged improvement is grounded. Therefore, expert evidence is admissible, if at all, in very exceptional cases.

Furthermore, under Patent Office practice, as a general rule, motions to dissolve an interference arising out of the testimony in the case will not be considered. *Sullivan* v. *Thompson*, 1901 C. D. 21; *Shallenberger* v. *Andrews*, 1902 C. D. 346, and cases therein cited; *Winton* v. *Jeffery*, 1904 C. D. 386.

The second error relied upon by appellants is that the Board of Appeals erred in "following the decision of the Examiner of Interferences, and holding that the Vincent application discloses the subject matter of the counts of the interference and awarding priority to Vincent."

It appears from the record, as stated by the tribunals of the Patent Office, that appellants' motion to dissolve the interference, on the ground that appellee's application did not disclose that the radial positive clutch teeth on the hub were in end to end relation with the positive clutch teeth on the driving shaft, as called for by each of the counts, was not filed until after the taking of the testimony in the case, and, therefore, was not within the motion period, as provided in rule 122 of the Rules of Practice in the United States Patent Office.

The motion to dissolve contains the statement that appellants failed to discover that appellee's application did not disclose the invention until appellee testified.

The Examiner of Interferences held, and was sustained by the Board of Appeals in so holding, that as the motion to dissolve was not filed during the motion period, and as the excuse offered for the delay in filing it was wholly insufficient, it should be dismissed.

[1] Appellants having failed to file the motion to dissolve, hereinbefore referred to, during the motion period, and having failed to give sufficient reason for the delay in filing, they cannot now be heard to argue that appellee's application does not disclose the involved invention. See *Felbel* v. *Oliver*, 1900 C. D. 150; *Smith* v. *Foley* v. *Anderson* v. *Smith*, 1908 C. D. 210; *Isom* v. *Dubbs*, 58 App. D. C. 25, 24 F.(2d) 467, 370 O. G. 760; *Urschel* v. *Crawford*, 22 C. C. P. A. (Patents) 727, 73 F.(2d) 510, 451 O. G. 238; *Rossiter* v. *Ellis*, 22 C. C. P. A. (Patents) 793, 74 F.(2d) 455, 454 O. G. 5.

[2] We find ourselves in complete accord with the conclusion reached by the tribunals of the Patent Office, and the decision of the Board of Appeals is affirmed.

In accordance with the stipulation entered into by the parties, filed in the Patent Office January 30, 1936, the costs of printing in the record the following papers is taxed against appellee: "File-wrapper and contents of Vincent application 466,949," except the application itself, and

"Amendment to the Vincent application, Serial No. 466,949, dated November 2, 1934 and included in the motion under rule 109."

Affirmed.

TOMLIN *v.* DUNLAP

No. 3,792. Decided March 29, 1937

[88 F.(2d) 727]

1. INTERFERENCE—ORAL TESTIMONY.

Testimony of a witness given after a lapse of three years that T. disclosed the invention in issue to him on March 7, 1931, *Held* entitled to little weight in fixing the time of disclosure where it appears that he had almost daily consultations with T. before and after that date.

2. SAME—PRIORITY.

Evidence reviewed and *Held* insufficient to establish a conception by T., the junior party of the invention, prior to the admitted date of conception of D. and that priority was properly awarded to D.

APPEAL from the Patent Office. Affirmed.

Mr. John R. Tomlin, Messrs. Philipp, Sawyer, Rice & Kennedy, and *Mr. Cleon J. Sawyer* for Tomlin.

Mr. Carl S. Lloyd for Dunlap.

LENROOT, *J.*:

This is an appeal in an interference proceeding wherein the Board of Appeals of the United States Patent Office affirmed a decision of the Examiner of Interferences awarding to appellee priority of invention as to all the counts involved, numbered 1 to 9, inclusive.

Count 1 is illustrative of the counts in issue and reads as follows:

1. The method of joining the webs of successive rolls of paper supplying a printing press, which consists in bringing a new roll having dry adhesive applied to the web thereof up to desired speed, moistening the adhesive while said new roll is rotating, and producing pressure between said new roll and the web proceeding from an expiring roll, whereby the adhesive is caused to adhere to the expiring web thus connecting the new web thereto without stopping the press.

The involved invention is concisely described in the decision of the Board of Appeals as follows:

The issue relates to alleged improvements in printing machinery, and more particularly to a method of introducing a new supply of paper in roll form to a press upon exhaustion of the previous supply. The method claimed involves the application to the roll to be added of an adhesive in dry form, bringing the roll up to a peripheral speed corresponding to that of the web being printed, moistening the adhesive and producing pressure between the roll thus treated and the web to cause the moistened adhesive to adhere to the web passing through the press and be threaded in turn therethrough. This operation is designed to take place without stopping the press, and preferably at normal printing speed.

Both parties took testimony. The only question brought here for review is whether the Board of Appeals erred in affirming the decision of the Examiner of Interferences that, upon the weight of the evidence, appellee was entitled to an award of priority of invention.

The interference arises between two applications for patent, that of appellant filed February 17, 1932, Serial No. 593,447, and appellee's application filed August 24, 1931, Serial No. 559,112. Appellant is therefore the junior party and the burden was upon him to establish priority by a preponderance of evidence.

The interference was originally declared on October 18, 1932, and at that time involved only counts 1 and 2. On November 18, 1932, appellant filed his preliminary statement with respect to said counts 1 and 2 and alleged that he conceived the invention

"on, about or before June 1, 1931, and on or about June 1, 1931, disclosed to others the invention of said counts."

He further stated in said preliminary statement:

There has been no reduction to practice of the invention other than filing applications for patents, and there has been no commercial use.

On January 4, 1933, appellant amended his preliminary statement, the only modification of his original statement being the allegation that he conceived the invention "on or about June 1, 1931," instead of "on, about or before June 1, 1931," as set out in his original statement.

Thereafter appellant copied ten claims from appellee's application and moved to add the same as additional counts of the interference. This motion was not opposed by appellee. Appellant also gave notice that at the final hearing he would refer to and use as evidence a patent issued to him on April 18, 1933, No. 1,904,571, and the original application and file wrapper in connection therewith. After various interlocutory proceedings, not material here, appellant's motion to add counts was allowed in part, and the interference was redeclared on February 2, 1934, upon the counts now before us.

On January 24, 1934, appellant filed a motion to amend his last preliminary statement as to counts 1 and 2, setting up the same dates of conception and reduction to practice as were later included in his preliminary statement with respect to the added counts of the interference, which dates are hereinafter set forth. He further moved that decision on this motion be postponed until final hearing on priority. On March 1, 1934, the Examiner of Interferences postponed consideration of the motion until final hearing.

On February 20, 1934, appellant filed a preliminary statement as to counts 3, 4, and 6 to 9, inclusive, and in this statement alleged conception and disclosure to others of the invention embraced in said added counts on or about March 7, 1931, a written description made on August 18, 1931, and reduction to practice on September 3, 1931. Said preliminary statement made no reference to count 5.

Upon final hearing, the Examiner of Interferences denied appellant's motion to amend his preliminary statement as to counts 1 and 2.

Upon appeal to the Board from the Examiner's award of priority to appellee, error was assigned in denying said motion to amend. While the Board recited this motion to amend and its denial, no express ruling was made thereon, but there was a general affirmance of the decision of the Examiner of Interferences. Upon appeal to this court, no reference is made to this motion or its denial in appellant's reasons of appeal, and therefore no question of error with respect to it is presented to us.

The Examiner of Interferences in his decision awarding priority to appellee held that, inasmuch as appellant had filed no preliminary statement as to count 5, judgment against him on this count must be entered, regardless of the evidence produced. In appellant's appeal to the Board, no error was assigned with respect to this ruling on count 5; the Board made no express reference to it and no error is assigned here in appellant's reasons of appeal; therefore, that question is not before us, although appellant's reasons of appeal appear to embrace all of the counts.

Before us appellant in his brief concedes that, upon the record, appellee is entitled to a date of conception as to all of the involved counts as of June 27, 1931, and constructive reduction to practice on August 24, 1931. In view of our conclusions hereinafter stated, and in view of such concession by appellant, it will be unnecessary to consider appellee's proofs in the case.

With respect to appellant's proofs, the Examiner of Interferences found that appellant's patent, No. 1,904,571, granted on an application filed prior to the conception date claimed by appellee in his preliminary statement, does not disclose the invention here involved, and stated with respect thereto as follows:

Tomlin has obtained a patent (1,904,571) granted on an application filed prior to the conception date of either party and disclosing every feature of the present counts except that instead of spraying a liquid solvent on dry adhesive, a liquid glue is sprayed onto the paper. The drawings of Tomlin's patent and application are identical. Since the counts have been held allowable over this patent it is clear that this use of water on dry glue, as distinguished from using wet glue, is the sole inventive feature and that Tomlin's case turns on when he conceived and developed this idea.

Before us appellant does not challenge the accuracy of this statement, and he depends wholly upon the evidence produced by him to establish priority of invention.

Upon the evidence produced, the Examiner of Interferences held that appellant had failed to establish conception of the invention prior to the dates accorded to appellee for conception, and that, even if appellant should be accorded an earlier date of conception, he was lacking in diligence in reducing the invention to practice at the time appellee entered the field.

The Board of Appeals concurred with the Examiner in holding that appellant had not established conception of the invention prior to the date for conception which appellant conceded appellee had established. The Board did not expressly pass upon the question of diligence referred to by the Examiner.

The entire case turns upon the probative weight that should be given to the testimony in behalf of appellant. The Examiner of Interferences in his decision stated that the only documentary evidence produced unequivocally referring to the use of water on dry glue, instead of the use of liquid glue, is the order for the preparation of appellant's application, which order is dated August 18, 1931, nearly two months after appellee's conception of the invention, and only six days before appellee's filing date. Upon an examination of the record we find this to be true.

There are in the record certain other documentary evidence and physical exhibits, but none of these disclose the invention here involved, nor do any of them have any connection with the invention here considered other than that they are connected with certain oral testimony on behalf of appellant.

As stated by the Examiner of Interferences, the use of water on dry glue, as distinguished from the use of wet glue, is the sole inventive feature here involved. This water is sprayed on dry adhesive, previously applied upon a roll of paper, by means of valves shown in appellant's prior patent. However, the valves in the patent are used for the purpose of spraying wet glue or other adhesive material on to the roll of paper. In other words, the only difference between appellant's patent and the invention here involved is the use of the valves for spraying water on dry adhesive material previously applied to the paper, instead of spraying wet glue through said valves.

Therefore, appellant's case depends wholly upon oral testimony given more than three years after the events testified to by appellant's witnesses, and such testimony is dependent wholly upon the recollection of the witnesses.

It appears that appellant, who is a patent attorney, was, from December, 1927, until February 15, 1933, executive engineer of R. Hoe & Company, a large manufacturer of printing presses, and that all of the other witnesses on behalf of appellant are present or former employees of said company.

Appellant testified positively that he conceived the invention and disclosed it to one Lundquist, engineer in charge of the "Research and Development Department," and to one Hezel, a draftsman. He fixed the date by reference to certain drawings, dated March 7, 1931, one of which drawings is of a valve "used for depositing either glue or solvent." In other words, there is nothing in said drawings disclosing this invention, but appellant fixes his conception of the invention by the date of the drawings. He testified that upon seeing them he told Lundquist, in the presence of Hezel, that

"• • • if glue, due to its viscosity, was so difficult to deposit, that I had definitely given thought to applying a solvent, water or any other solvent, and this valve in which a piston was employed definitely caused my mind to shift to the perfection of an idea for depositing either water or solvent on the terminal of a roll of paper."

He further stated:

Q. 20. With this solvent as conceived by you at that time for use with this piston valve, how did you propose to use the solvent? A. I proposed to use it precisely as we would glue, the only difference being the solvent being more mobile than glue, it would be less difficult to deposit.

Appellant further testified that he also disclosed his conception to other employees of the Hoe Company, viz., Stanley Myers, Louis A. Masson, Albert H. Jung, and Albert J. Horton.

Before further considering the testimony of appellant, we will briefly consider the testimony of the other witnesses. Mr. Hezel did not testify. The witness Lundquist testified, with reference to appellant's claimed disclosure, as follows:

Q. 11. Did you have any conversation with Mr. Tomlin, the inventor of the patent in interference, at the time of making this drawing of March 7th? A. Yes; at that time and *previous to that time* Mr. Tomlin had disclosed to me his idea of development of a valve for either glue or water or other solvent. [Italics ours.]

It thus appears that the witness Lundquist testified to a date of disclosure to him antedating the time of conception positively testified to by appellant.

[1] The witness testified further that he discussed matters relating to his department with appellant almost every day; that many drawings were made of many experimental devices, and yet he was positive from his own recollection that appellant disclosed the invention to him on March 7, 1931, and even before that date. Upon this point he testified on cross-examination as follows:

XQ. 119. Do you mean to tell us after this length of time you can tell what date it was, three years ago, when you heard Mr. Tomlin mention the use of a solvent to you? A. Yes, I believe so, because we were in very frequent consultation on the subject.

It would seem obvious that the fact that appellant and witness had frequent consultations on the subject would not aid the witness in fixing the exact date of appellant's disclosure.

Conceding the intention of the witness to testify accurately, it is apparent that little weight should be given his testimony with respect to the time of appellant's disclosure to him of the invention.

We find nothing in Masson's testimony tending to corroborate appellant's testimony that he conceived the invention and disclosed it to others prior to June 27, 1931, appellee's date of conception.

The witness Myers testified to a disclosure of the invention to him by appellant after the valve was made pursuant to the drawing of March 7, 1931. As to the date of such disclosure he testified as follows:

Q. 10. Can you fix the date, approximately, when you had this conversation with Mr. Tomlin? A. I cannot give you the exact date of it, but I know that it was very soon after the valve was made up, because it was after the first test had been made they found they could not get the glue out fast enough.

Upon cross-examination, the witness testified as follows:

XQ. 42. Just noticing these tickets, work tickets, representing work done by Mr. Kovach, which bear dates running from March 11, 1931—the last one I see is July 1st, 1931—you think it might have been shortly after July 1st that you discussed this matter with Mr. Tomlin? A. I would not say July, because I don't know what date it would be; I know it was after the first test on that first valve.

The witness Jung was employed to design glue valves for use in a web replenishing machine. He testified that certain sketches, which are in the record as exhibits, were made by him in April, 1931, and that the valves shown in these sketches were to be used for "Both glue and water." He further testified that during the time he made these sketches appellant suggested to him "that we spray water with those valves." The witness fixes the time of this disclosure with reference to his stay in a hospital, stating that the disclosure was prior to his going to the hospital on April 20, 1931.

We find nothing in the testimony of the witness Horton tending to corroborate appellant's testimony that he conceived the invention prior to June 27, 1931, the date conceded to appellee for conception.

With respect to appellant's testimony, we would observe that in his preliminary statement with respect to counts 1 and 2, he alleged that he conceived the invention on or about June 1, 1931, and that there was no actual reduction to practice prior to his filing date, while his testimony is positive that he conceived and disclosed it on March 7, 1931, and that it was actually reduced to practice in September, 1931, and that he saw the apparatus successfully operated about ten times, using the method embraced in the involved counts. We do not refer to this as intimating that appellant was not honestly of the opinion on January 4, 1933, the date of said preliminary statement, that he conceived the invention on or about June 1, 1931, or that he was not likewise honestly of the opinion on February 20, 1934, that he conceived it on or about March 7, 1931, and that it was actually reduced to practice on or about September 3, 1931. Appellant explains the discrepancy in the statements by stating that the first preliminary statements were made wholly upon his own recollection after consulting with the witness Horton, while his last preliminary statement was made after refreshing his memory by conversations with the witnesses Lundquist and Myers. We think it proper to observe that appellant had nothing to gain by alleging in his last preliminary statement a date of conception earlier than the date alleged in his first statement, for either date, if established, would have antedated the date of conception of the invention by appellee. We refer to this matter only for the purpose of calling attention to the fact that the recollection of appellant was not clear as to dates, as might be expected after a lapse of three years where there were no records, prior to August 18, 1931, that are positively identified with the invention here involved.

We would further observe that there were drawings made and glue valves produced during a period from March, 1931, until after June 27, 1931, and the disclosure of the invention by appellant might have been before or after June 27, 1931, and appellant and his witnesses may have been mistaken in the dates of disclosure testified to by them.

[2] We have not attempted to analyze in this opinion all of the testimony in the case, but after a careful examination of the entire record we are inclined to the opinion that the Patent Office tribunals rightly found that appellant had not established a date of conception of the invention prior to June 27, 1931, and in any event we cannot find that the concurring decisions of the Patent Office tribunals upon this point were manifestly wrong. Under the well established rule, it would be necessary for us so to find in order to reverse the decision of the Board of Appeals in this case.

Inasmuch as we must conclude from the record that appellee was the first to conceive and disclose the invention, and was diligent in reducing it to practice by filing his application for a patent, it is unnecessary for us to consider actual reduction to practice by either appellant or appellee.

For the reasons stated herein, the decision of the Board of Appeals is affirmed.

Affirmed.

HATFIELD, *J.*, did not participate in this decision.

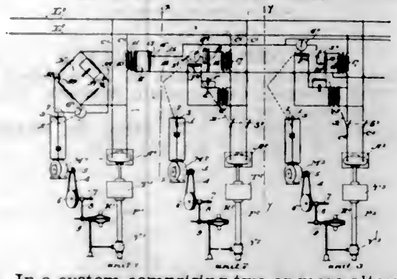
16,569.—*Title:* STARMAN SYPHONS. For Syphons for Carbonated Beverages. STARMAN SYPHON MFG. CO., INC., Brooklyn, N. Y. Published September 2, 1937.

16,570.—*Title:* FAEMADE UNDERGARMENTS. For Undergarments. ROBERT A. WENTZEL, Palmyra, Pa. Published October 27, 1935.

REISSUES

NOVEMBER 9, 1937



20,548

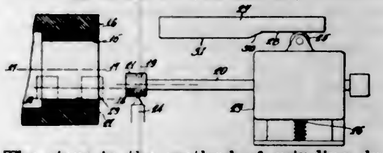
APPARATUS FOR CONTROLLING LOAD DISTRIBUTION

Edgar D. Doyle, Philadelphia, Pa., assignor to Leeds & Northrup Company, Philadelphia, Pa., a corporation of Pennsylvania

Original No. 1,918,021, dated July 11, 1933, Serial No. 393,650, September 19, 1929. Application for reissue July 9, 1935, Serial No. 30,567

38 Claims. (Cl. 171—119)

1. In a system comprising two or more alternators, a totalizing circuit including impedance traversed by current of magnitude representative of total output of said alternators, impedances traversed by currents of magnitude determined by the loads upon the respective alternators, and means individually to control said alternators comprising a frequency-responsive bridge in whose galvanometer arm there is included one of said individual load impedances and a selected part of said impedance of said totalizing circuit.



20,549

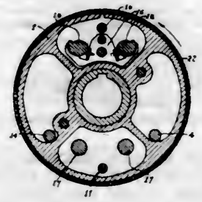
TWO SLIDE AUTOMATIC GRINDING MACHINE

Clifford T. Raule, Vista, Calif., assignor to The Heald Machine Company, Worcester, Mass., a corporation of Massachusetts

Original No. 1,997,978, dated April 16, 1935, Serial No. 140,034, October 7, 1926. Application for reissue April 6, 1937, Serial No. 135,351

11 Claims. (Cl. 51—50)

1. The steps in the method of grinding duplicate internal surfaces of revolution in successive workpieces, using a grinding wheel and a truing diamond, which consist in rotating each workpiece, in setting the diamond in front of the workpiece with its point inwardly of the longitudinal line of intended initial cut, in moving the rotating wheel longitudinally forward across the diamond and to some distance within the work while maintaining the wheel out of contact with the work, in relatively onsetting the wheel and work and in longitudinally reciprocating the rotating wheel, bringing its grinding face into the line of finished grinding.



20,550

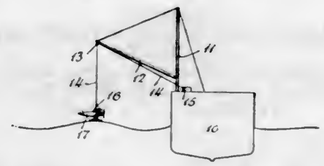
SANDING DRUM

Avery W. Walker, Niagara Falls, N. Y., assignor, by mesne assignments, to The Carborundum Company, Niagara Falls, N. Y., a corporation of Delaware

Original No. 1,992,105, dated February 19, 1935, Serial No. 701,489, December 8, 1933. Application for reissue August 25, 1936, Serial No. 97,732

14 Claims. (Cl. 51—194)

14. A polishing wheel having a drum face, a cushion secured on the drum face, an abrasive band surrounding said cushion, and means on the wheel for imposing a tension on the abrasive band and for automatically statically balancing the wheel for varying amounts of tension.



20,551

MOORING AND HOISTING APPARATUS

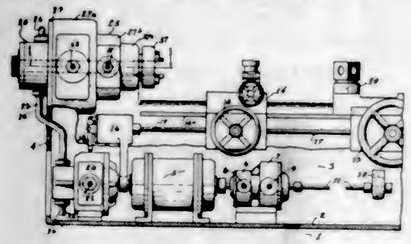
Warren E. Rouse, Pleasant Ridge, Mich., assignor to The Waterbury Tool Company, Waterbury, Conn., a corporation of Connecticut

Original No. 1,902,972, dated March 28, 1933, Serial No. 608,181, April 29, 1932. Application for reissue March 17, 1936, Serial No. 69,391

25 Claims. (Cl. 9—22)

1. In a device of the kind described including a rotatable drum, and a cable attached to an object floating in water subject to rise and fall sure lower than that required to hoist the floating object from the water for by-passing said through wave action and leading to said drum; that improvement which comprises pressure fluid actuated means for operating said drum, said means including a valve for relieving abnormal pressures and means responsive to a fluid prespressure fluid to automatically regulate and control the volume operatively effective upon said motor in predetermined accordance with the rise and fall of said floating object whereby said drum is operated to automatically maintain said cable against slack in harmony with the rising and falling movements of said object.

PATENTS



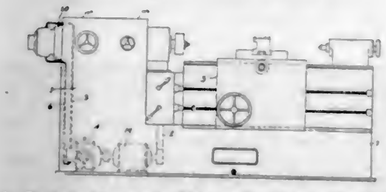
GRANTED NOVEMBER 9, 1937

2,098,213

HYDRAULIC MOTOR FOR ROTARY SPINDLE MACHINES

Elek K. Benedek, Bucyrus, Ohio

Application June 7, 1935, Serial No. 25,449
32 Claims. (Cl. 29—42)



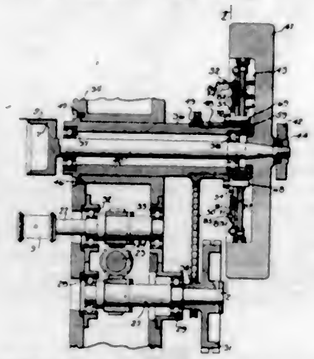
1. In a rotary spindle machine, a support, a rotary, radial plunger, hydraulic motor carried by said support, said motor comprising a rotatable barrel, radial cylinders therein, plungers reciprocable in the cylinders respectively and reactance means for the plungers, fluid ducts in said barrel connected with said cylinders respectively, each duct being continuously in communication with its associated cylinder, said barrel having valve ports connected with ducts respectively, valve means in valving cooperation with said ports, said barrel having an axial bore coaxial with the axis of rotation of the barrel and extending entirely therethrough from end to end, and being open at the ends for accommodating the work piece to be operated by the machine, a spindle having a work piece accommodating passage open at both ends and coaxial with the barrel passage, means drivingly connecting the barrel and spindle, and means for supplying pressure fluid to said motor for driving the same.

2,098,214

HYDRAULIC MOTOR FOR ROTARY SPINDLE MACHINES

Elek K. Benedek, Bucyrus, Ohio

Application June 16, 1936, Serial No. 85,550
14 Claims. (Cl. 82—2)



1. In a rotary spindle machine, a casing, a rotary radial plunger, hydraulic motor carried in the casing, said motor comprising a rotatable barrel, radial cylinders therein, plungers reciprocable in the cylinders respectively, reactance means for the plungers, fluid ducts in said barrel connected with said cylinders respectively, each duct being continuously in communication with its associated cylinder, anti-friction radial and axial thrust bearings mounted in the casing and supporting the barrel at both ends for rotation therein, an end portion of the barrel extending endwise beyond the associated bearings and having valve ports respective to said ducts, a valve head surrounding said barrel portion and having ports in valving cooperation with said valve ports, means detachably securing said valve head to the casing, and anti-friction bearings carried by said head and in cooperation with said barrel for constraining the head and barrel to coaxial relation.

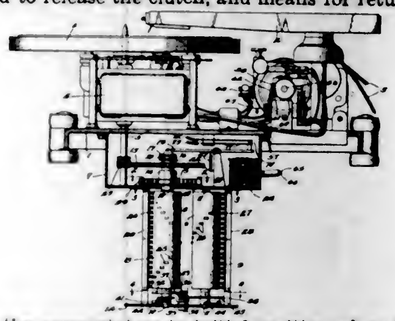
2,098,215

FILM DRIVING APPARATUS

William A. Black, Montclair, N. J., assignor to United Research Corporation, Burbank, Calif., a corporation of Delaware

Application July 14, 1936, Serial No. 90,559
8 Claims. (Cl. 271—2.3)

1. A system for the continuous and uniform advancement of a film past a translation point comprising a film roller, a shaft having said roller mounted on one end thereof, a flywheel mounted on the other end of said shaft, a quill within which said shaft is rotatable, a bearing exterior of said quill and at one end thereof, a hollow rotatable shaft adapted to rotate on said bearing, means for driving said hollow shaft, and means for interconnecting said shaft with said flywheel during acceleration of said flywheel and for instantly disconnecting said shaft from said flywheel when said flywheel has reached uniform speed, said flywheel being driven thereafter by said film at the speed of said flywheel when released.



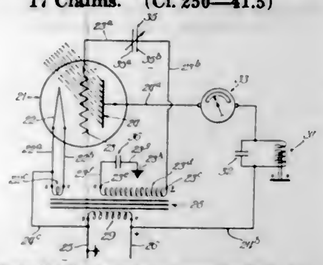
2,098,216

ROBOT PHONOGRAPH

Lloyd J. Andres, Chicago, Ill., assignor to Automatic Instrument Company, Grand Rapids, Mich., a corporation of Michigan

Application March 9, 1936, Serial No. 67,863
13 Claims. (Cl. 274—1)

12. In a multiple contactor for a robot phonograph having a turntable for playing a record, a pick-up arm and a motor for moving it to and from record engaging position, a plurality of commutators driven by the turntable, each having a series of contacts, intermittent gearing connecting the commutators, a clutch for connecting the commutators to the turntable, and a relay actuated when the pick-up arm motor is actuated to release the clutch, and means for returning the commutators to initial position when the relay is actuated.



2,098,217

ELECTRONIC APPARATUS

Fred B. Aubert and Jerome Rossetti, Chicago, Ill., assignors, by direct and mesne assignments, to Super Sensitive Controls Corp., a corporation of Illinois

Application August 22, 1935, Serial No. 37,396
17 Claims. (Cl. 250—41.5)

14. A translating system comprising, in combination, an electric valve having an anode, a cathode and a control electrode; means for applying an alternating potential between said anode and cathode, means for biasing said control electrode to a potential negative with respect to said cathode, means for increasing the negative potential of said control electrode as a function of light intensity, and means connected to be responsive to the change in current flow through said valve in response to change in said light intensity.

2,098,218

BOBBIN AND METHOD OF PRODUCING THE SAME

Dickerson G. Baker, Holyoke, Mass., assignor to The American Thread Company, New York, N. Y., a corporation of New Jersey

Application December 16, 1931, Serial No. 581,324
Renewed April 28, 1937
3 Claims. (Cl. 112—251)

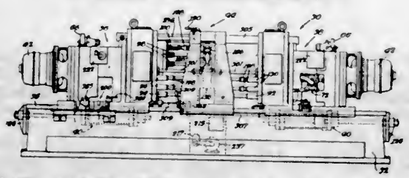
1. In a filled bobbin having a tubular core having thread cross-wound thereon in a mass, and disks of resilient material on the ends of said core, the improvement which comprises said core being provided at each end with a series of outwardly struck projections indented into the inner edge of the inner periphery of the associated disk, and the ends of the core being swaged so as to secure the disks against the ends of the thread mass.

2,098,219

METHOD OF MAKING WOUND BOBBINS

Dickerson G. Baker, Holyoke, Mass., assignor to The American Thread Company, New York, N. Y., a corporation of New Jersey

Application April 13, 1935, Serial No. 16,148
1 Claim. (Cl. 112—251)



The method of making bobbins of the type described which comprises cross winding thread on a core having shoulders spaced equal distances from the ends of the core, the thread being wound substantially flush with the shoulders on the core, thereafter applying disks on the ends of the core, subjecting the disks, mass of thread and core to pressure axially applied, and swaging over the ends of the core so as to cause said ends to hold the disks against said shoulders and against the thread mass.

2,098,220

MATERIAL WORKING APPARATUS

John S. Barnes, Paul R. Guirl, and George C. Johnson, Rockford, Ill., assignors to W. F. & John Barnes Company, Rockford, Ill., a corporation of Illinois

Application August 12, 1932, Serial No. 628,580
Renewed December 5, 1936
48 Claims. (Cl. 29—38)

1. In metal working apparatus, a support for a plurality of work-pieces, spindle carrying means positioned on opposite sides of said work support, a plurality of spindles in said spindle carrying means adapted to carry tools for performing a succession of cutting operations upon each work-piece from opposite sides thereof, power means for effecting relative movement between the support carrying the spindles and the work-piece, whereby to cause the tools carried by said spindles to act upon the work from opposite sides thereof, control means for adjustably varying the speed of the power means during and in preselected timed relation with respect to the complete automatic cycle of operation of the spindle carrier, and means for indexing the work support after each machining operation, whereby to enable a succession of machining operations to be performed on each work-piece until completed.

2,098,221

CEMENT OR BINDER MATERIAL

Philip S. Barnhart, Westfield, Mass., assignor to Westfield River Paper Company, Russell, Mass., a corporation of Massachusetts

No Drawing. Application January 15, 1936, Serial No. 59,308
4 Claims. (Cl. 134—17)

1. A cement or binder composed of a mixture of paraffin wax having a melting point of approximately 155° F., rosin, rubber and petrolatum having a melting point of approximately 125° F., said ingredients being thoroughly intermixed and combined in the following proportions, namely, wax 40–63%, rosin 20–45%, rubber 3–12% and petrolatum 7–13%.

2,098,222

METHOD OF MAKING CEMENT OR BONDING MATERIAL

Philip S. Barnhart, Westfield, Mass., assignor to Westfield River Paper Company, Russell, Mass., a corporation of Massachusetts

No Drawing. Application January 15, 1936, Serial No. 59,309
4 Claims. (Cl. 134—17)

1. A method of compounding a cement or bonding material having as ingredients wax, rosin, rubber and petrolatum which consists of softening the rubber by a pressing and kneading action, adding petrolatum to the rubber and heating and thoroughly intermixing the rubber and petrolatum mixture and then adding the mixture to melted paraffin wax and petrolatum and adding rosin to said mixture.

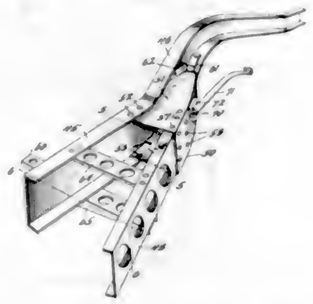
2,098,223

LAMINATED SHEET OF PAPER OR LIKE MATERIAL

Philip S. Barnhart, Westfield, Mass., assignor to Westfield River Paper Company, Russell, Mass., a corporation of Massachusetts

Application January 15, 1936, Serial No. 59,310
4 Claims. (Cl. 154—50)

1. A laminated paper sheet comprising a pair of sheets of glassine paper united by a binder composed of a mixture of paraffin wax having a melting point of approximately 155° F., rosin, rubber and petrolatum having a melting point of approximately 125° F., said ingredients being combined in the following approximate proportions, namely, wax 40–63%, rosin 20–45%, rubber 3–12% and petroleum 7–13%.



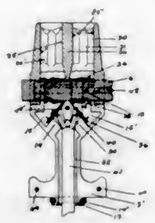
2,098,224

MOTOR VEHICLE

Frank C. Best, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan

Application June 30, 1934, Serial No. 733,317
9 Claims. (Cl. 280—106)

1. In a motor vehicle frame, the combination with side frame members of channel section having the flanges thereof directed inwardly, of an X frame structure connecting said side frame members, said X frame structure including forwardly extended members forming an acute angle with said side frame members, and generally U-shaped members having the legs thereof secured to the respective flanges of said side frame members and having the bases thereof engaging



and secured to the members of said X frame structure.

2,098,225

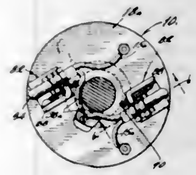
SWITCH PLUG CONNECTER

Pearley B. Boone, San Francisco, Calif.

Application May 15, 1934, Serial No. 725,714
12 Claims. (Cl. 200—51)

1. An electrical plug connecter comprising a body formed of two separate plug members each provided with a pair of spaced contact terminals therein, a switch device movably mounted within the connecter arranged and adapted to connect and to disconnect the pairs of terminals upon movement thereof, said plug members and switch device being formed and adapted to coact for retaining the plug members connected together.

2,098,226



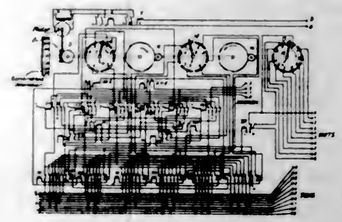
ENGINE STARTING APPARATUS

James A. Charter, Chicago, Ill., assignor to Charter Automatic Starter Inc., Chicago, Ill., a corporation of Illinois

Application June 27, 1932, Serial No. 619,565
2 Claims. (Cl. 290—80)

1. In starting mechanism for internal combustion engines and the like, a drive shaft, a supporting plate mounted on said shaft in a plane at right angles to the axis of said shaft, a plurality of tubes each adapted to contain a body of mercury, a body of mercury in each tube, mountings for said tubes allowing rotation thereof about a horizontal axis, said tubes being secured by said mountings about said shaft on said plate in outwardly and upwardly slanted positions in planes parallel to the axis of said shaft and coincident with tangents to a circle

concentric with said shaft but smaller than said plate, screw adjusting means carried by said mountings for varying the upward slant of said tubes, and a pair of contacts in the inner and lower end of each tube and adapted to be connected by the body of mercury therein, said bod-



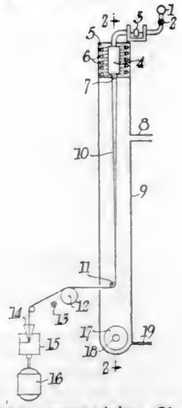
ies of mercury connecting said contacts when said plate is stationary or rotating at less than a selected speed, and leaving said contacts to remove the connection therebetween upon a sudden acceleration of the rotation of said plate or upon said plate rotating at more than said selected speed.

2,098,227

TELEGRAPHY SYSTEM WITH POSITION INDICATORS

Louis Lucien Eugene Chauveau, Paris, France, assignor to Compagnie Generale de Telegraphie Sans Fil, a corporation of France

Application February 20, 1934, Serial No. 712,130
In France February 20, 1933
1 Claim. (Cl. 177—311)



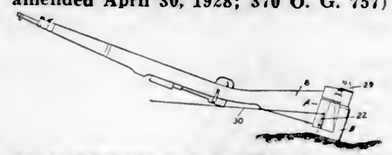
Apparatus for controlling a movable member remotely located from a control and indicating station having indicating means to indicate the position of said movable member, comprising a reversibly controlled motor for driving said movable member to be controlled through different degrees of rotation, means coupled to said motor for driving a distributor mechanism through ratio gearing means to make and break contacts proportional to hundreds, tens and units degrees of rotation of said controlled member, said contacts being made to select and energize corresponding conductors leading to said control and indicating station, where said energized conductors control corresponding relays to establish potential drops across corresponding resistors and excite separate indicators in proportion to the hundreds, tens and units degrees of rotation of said controlled member, and means for simultaneous readings of the separate indicators to give an indication in degrees of the then obtained angular position of the controlled member.

2,098,228

ARTIFICIAL SILK

Hans T. Clarke, New York, and Carl J. Malm, Rochester, N. Y., assignors, by mesne assignments, to Eastman Kodak Company, Jersey City, N. J., a corporation of New Jersey

Original application March 4, 1931, Serial No. 520,149. Divided and this application June 22, 1934, Serial No. 731,916
6 Claims. (Cl. 28—1)



1. Synthetic yarn comprising filaments of cellulose acetate-butyrate containing acetyl groups and having a butyryl content of at least 10%.

2,098,229

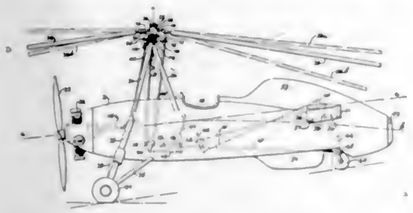
DISCHARGER FOR PROJECTILES

Richard C. Coupland, United States Army, Norfolk, Va.

Application August 14, 1935, Serial No. 36,137
7 Claims. (Cl. 42—1)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a discharger, a receiver comprising a body having spaced rails, hollow stud bolts in the top of the body, a cap plate on the bolts, nuts on the bolts, said body and cap plate having in one side complemental elements of a socket, a groove in the opposite side of the body between the rails, a barrel holder between the rails of the body and having a tongue slidable in the groove of the body, a foot on the holder extending under the body, a barrel carried by the holder, rods fixed in the foot and extending through the body and hollow stud bolts, a spring on each rod confined between the body and the front end of the rod, and a firing mechanism in the holder.

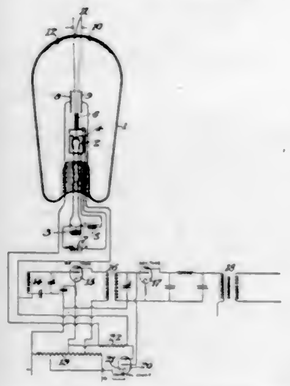
2,098,230



AIRCRAFT WITH FREELY ROTATIVE WINGS

Juan de la Cierva, Madrid, Spain, assignor to Autogiro Company of America, Philadelphia, Pa., a corporation of Delaware

Application March 6, 1934, Serial No. 714,242. Renewed October 23, 1936. In Great Britain March 13, 1933
26 Claims. (Cl. 244—19)

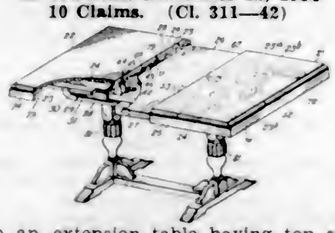


1. In an aircraft having a powered means of forward propulsion and a normally air-driven

autorotative-winged rotor as the primary means of sustension, controlling mechanism operatively connected with the rotor to vary the position of the lift line thereof relative to the aircraft for purposes of lateral control, and normally fixed surfacing positioned within the slipstream of said propulsion means at an aerodynamic incidence relative thereto to effect an automatic couple opposite to the reaction torque of the

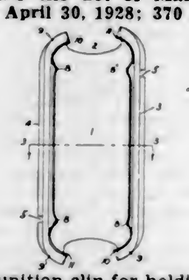
propulsion means, the positioning and effective area of said surfacing within the slipstream being such as to render said couple of a magnitude approximating the magnitude of the reaction torque, whereby the burden of correcting for such torque is substantially removed from the rotor controlling mechanism, together with means automatically acting to substantially eliminate yawing of the craft throughout the range of slipstream conditions.

2,098,231
CATHODE RAY DEVICE
Allen B. Du Mont, Upper Montclair, N. J., assignor to Allen B. Du Mont Laboratories, Inc., Upper Montclair, N. J., a corporation of Delaware
Application May 28, 1932, Serial No. 614,064
6 Claims. (Cl. 250—40)



1. A cathode ray tube comprising a bulb, different substances mounted upon a side of the bulb making an acute angle with the rays and differently affected by said cathode rays for making the said rays differentially manifest to human sense, and means for deflecting said rays to transfer their effect from one of said substances to another, said substances respectively occupying segregated areas which appear to the eye as separate and distinct.

2,098,232
COATING COAL
Harvey R. Fife, Pittsburgh, Pa.
No Drawing. Application March 2, 1934, Serial No. 713,694. Renewed December 19, 1936
9 Claims. (Cl. 44—6)

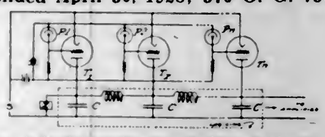


2. A coating composition for protectively coating solid lump fuel of the type subject to degradation by oxidation and to objectionable dusting comprising a paraffin substance having the approximate composition of a blend of paraffin wax and a petrolatum, said coating composition being substantially non-volatile at temperatures below 500° F., and said coating composition as existing in an applied film on the lump fuel being noncrystalline and tough at low temperatures and having lubricating qualities.

2,098,233
EXTENSION TABLE
Norman Stanley Giles, Glen Iris, Australia
Application November 9, 1935, Serial No. 48,959
In Australia November 12, 1934
10 Claims. (Cl. 311—42)

1. In an extension table having top sections arranged to be moved horizontally toward and from each other, a vertically movable leaf arranged to be housed below the said sections and to be raised to align therewith, means to raise the leaf when the sections are moved apart, means arranged to hold the leaf in raised position, and means on the leaf adapted to engage said holding means and arranged so that when the lifted leaf is moved horizontally, it is supported independently of the lifting means.

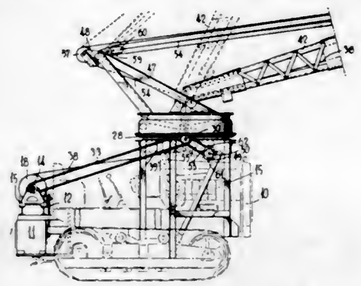
2,098,234
CARTRIDGE CLIP FOR FIREARMS
John C. Garand, Springfield, Mass., assignor to the Government of the United States of America, as represented by the Secretary of War
Application May 22, 1929, Serial No. 365,205
4 Claims. (Cl. 42—88)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



1. An ammunition clip for holding two rows of cartridges in staggered relation and adapted to be inserted into the magazine of a firearm embodying a back plate, side plates extending from the back plate, inwardly curved ends on the side plates, and projections on the side plates adjacent to the ends extending into the rectilinear paths of travel of the cartridges as they are elevated through the clip.

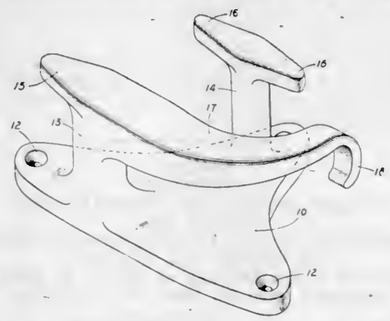
2,098,235
CUSHION SHOE
Francis M. Gilkerson, St. Louis, Mo., assignor of one-half to Paul H. Gilkerson, St. Louis, Mo.
Application March 30, 1935, Serial No. 13,803
2 Claims. (Cl. 36—17)

1. In a cushion shoe, the combination of a shape-determining inner sole, an upper, an outer sole, a welt, a resilient cushion member coextensive with and cemented to the bottom side of the insole at the forepart of the shoe and cemented to the outsole at the forepart over a sufficient area so as to cause the sole members to act as a unit, the upper having a lasted over edge at the forepart overlapping the outer edge portion of said cushion member, means passing through and securing together said inner sole, outer edge portion of said cushion member, lasted over edge of said upper and the welt, and means securing said outer sole to said welt at the forepart of the shoe.



2,098,236
TELEVISION TRANSMISSION SYSTEM
Marcel J. E. Golay, Oceanport, N. J.
Application June 6, 1933, Serial No. 674,558
7 Claims. (Cl. 178—7.1)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In a television transmission system, which employs an image plane divided into lines; means for translating light energy into electrical energy, comprising light sensitive cells arranged in a column and corresponding in number of units to the number of said lines; means for projecting upon the cells the image of an object to be transmitted and for shifting the image across said column of cells; circuit means operatively coupled to the output of said cells, comprising a general circuit and a series of local circuits; and means to effect a commutation of the signal impulses comprising lag line sections operative with each local circuit whereby a signal impulse will cause a charge to be placed upon the lag line sections which is a direct function of the illumination of their respective cells at any instant, all of said lag line sections being serially connected to form a single lag line which is characterized by a time delay which determines the time consumed in scanning one column of points of said image plane.

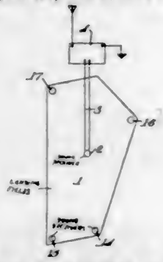


2,098,237
FULL CIRCLE BOOM CRANE
James Hailey, Tulsa, Okla.
Application August 17, 1936, Serial No. 96,511
7 Claims. (Cl. 212—68)

1. A full circle boom crane comprising a race having a hollow king pin, a turn table mounted on the race and rotatable about the axis of said pin, a boom hingedly mounted on the central portion of the table for movement about an axis arranged perpendicular to the axis of the king pin, a back brace mounted on the table and extending upwardly and outwardly away from the periphery of the table, sheaves carried by the upper end portion of the back brace and by the outer end portion of the boom, a sheave connected to the race and arranged below the king pin, another sheave mounted on the turn table at one side of

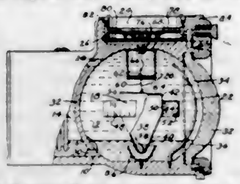
the king pin, a boom line guided by said sheaves and having one of its ends operatively connected to the back brace, means for winding and unwinding the boom line, hook line sheaves supported by the boom, another hook line sheave mounted on the turn table at the opposite side of the king pin, another hook line sheave carried by the race and arranged below the king pin, a hook line guided by the hook line sheaves and extending through the king pin, and means for winding and unwinding the hook line.

2,098,238
BITT-CHOCK
Charles G. Halpine, United States Navy
Application April 22, 1937, Serial No. 138,410
5 Claims. (Cl. 114—101)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



1. A chock comprising a post; and a second post arranged in spaced relation to said first mentioned post, said first mentioned post being provided with an arm projecting laterally to a point offset with respect to said second post and thence longitudinally to a point in substantially lateral alignment with and in spaced relation to said second post for preventing a line disposed between said posts from becoming displaced therefrom by strains exerted along said line.

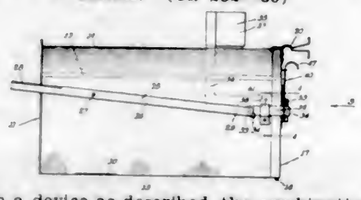
2,098,239
SYNTHESIS OF CYCLOPROPANE
Henry B. Hass and George E. Hinds, West Lafayette, Ind., assignors to Purdue Research Foundation, West Lafayette, Ind., a corporation of Indiana
No Drawing. Application March 26, 1934, Serial No. 717,429
15 Claims. (Cl. 260—167)



1. The process of producing cyclopropane, which consists in causing trimethylene chloride to react with a metal of the class consisting of zinc, magnesium, and sodium, in the substantial absence of any compound containing hydrogen displaceable by the metal used under the conditions employed in the reaction, and under boiling-point-raising conditions and at a temperature above the normal boiling point of trimethylene chloride; to obtain a chloride of the metal, and cyclopropane.

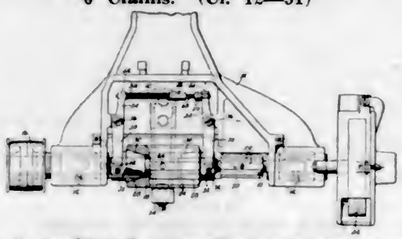
2,098,240
NAVIGATION OF AIRCRAFT
Harvey C. Hayes, Washington, D. C.
Original application March 11, 1931, Serial No. 521,686. Divided and this application January 22, 1935, Serial No. 2,970
5 Claims. (Cl. 177—352)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. In combination, a plurality of sound pick-up devices located at definite points on or about a landing field, each of said pick-up devices being tuned so as to respond to a definite and different frequency component of the sound generated by an aircraft, a radio transmitter for broadcasting the pick-up of said pick-up devices, and radio receiving means on said aircraft for receiving from said radio transmitter the sounds picked up by said pick-up devices so that the pilot may determine the position of his craft with respect to said landing field.



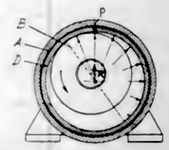
2,098,241
COMPASS
Albert F. Hegenberger and Max Isaacson, Dayton, Ohio
Application February 14, 1933, Serial No. 656,708
33 Claims. (Cl. 33—223)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A liquid damped magnetic compass comprising, two suitable immiscible mediums of different densities and a magnetically controlled card having a mean density greater than that of the lighter medium but sufficiently less than that of the heavier medium so that a major portion of the card, including the portion bearing the cardinal points, is buoyantly supported in the lighter liquid medium, and having a form such that the portion of the card that lies in the common surface of said mediums is sufficiently small in cross-sectional area as to effect a negligible surface tension drag.



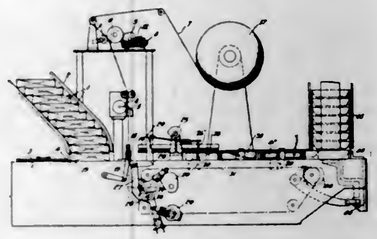
31. In a compass, the combination with a liquid damped magnetic sensitive element, of a buoyant member for operably supporting such element, said member being provided with a thermo-expansible medium whereby a buoyant effect is produced that is substantially constant at different temperatures.

2,098,242
RURAL MAIL BOX
Charles I. Holmes, Chino, Calif., assignor of one-fourth to Roy Sebring, and one-fourth to Ernest W. Soper, both of Chino, Calif.
Application May 15, 1935, Serial No. 21,517
7 Claims. (Cl. 232—35)



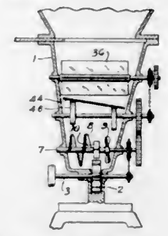
1. In a device as described, the combination of a mail box having a hinged door at one end, an owner's signal having a straight arm pivoted to one side of the box, a pivotally mounted catch on the side of the box having a hook to engage one end of the said arm and hold the arm in non-signalling position, a latch bolt slidably mounted on the door, and a spring normally retaining said bolt in inoperative position, the bolt having a finger to engage the catch on manually operated movement of the bolt to actuate the catch to release the said arm, the arm being weighted to swing by gravity into a vertical signalling position.

2,098,243
SHOE BEATING MACHINE
Charles E. Hood, Lynn, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application May 4, 1936, Serial No. 77,702
In Great Britain March 6, 1936
6 Claims. (Cl. 12—51)



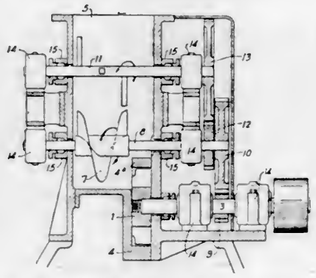
1. A machine for operating upon shoes comprising a shaft, a smoothing roll secured to the shaft and having a recess in one end thereof, and means for heating the roll comprising an annular member movable longitudinally of the shaft, and means for forcing the member into frictional engagement with the wall of the recess.

2,098,244
ROTATING MACHINE
Georg Hopfensberger, Heidenheim-on-the-Brenz, Germany
Application February 6, 1936, Serial No. 62,653
In Germany February 7, 1935
5 Claims. (Cl. 230—79)



1. In a rotating machine, a rotating cylindrical drum mounted on bearings, a multiple-cell runner mounted eccentrically with respect to said drum and rotating within said drum, an auxiliary fluid between said drum and said runner and means for sealing the cells of said runner, the axis of rotation of said runner being above that of said drum and being so disposed that the resultant of the sealing, centrifugal action, and working forces substantially completely counteracts the action of gravity.

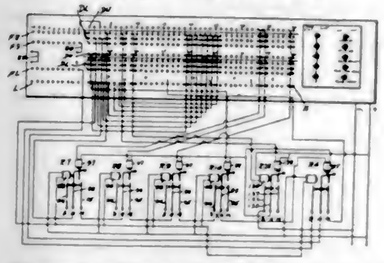
2,098,245
WRAPPING MACHINE
Thomas Grayland Jackson, Deptford, London, England, assignor to Molins Machine Company, Limited, London, England
Application September 27, 1935, Serial No. 42,521
In Great Britain October 19, 1934
12 Claims. (Cl. 93—2)



9. In a wrapper machine, the combination with means to position a wrapper blank transversely of the path of an article, of a plunger to move an article into engagement with a wrapper blank and to move the article and wrapper blank to mechanism to partly fold the wrapper blank about the article, folding devices to complete the folding of the wrapper blank about the article, and a pusher piece carried by an endless conveyor to engage the partly wrapped article and to move it to said folding devices, said mechanism for partly folding the wrapper blank about the article including means to fold the wrapper blank into a U about one face of the article, one limb of the U being longer than the other limb, means to fold the end portion of the longer limb so that it is overlapped by the shorter limb, said shorter limb being folded into engagement with the article before the end portion of the longer limb, and means to lift the end portion of the shorter limb clear of the article whilst the end portion of the longer limb is being folded into position to be overlapped by the longer limb.

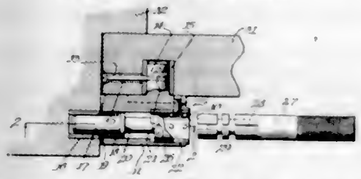
2,098,246
AUTOMATIC BAG-FILLING AND WEIGHING MACHINE
René Jarrier, Saint Quentin, France, assignor to Bartlett Arkell, New York, N. Y.
Application March 24, 1932, Serial No. 600,884. Renewed January 25, 1936. In France April 4, 1931
10 Claims. (Cl. 198—128)

1. In a bag filling machine of the class described, the combination of a hopper having a discharge throat near its lower end and a pocket leading into said throat, a propeller having a substantially horizontal axis and blades projecting generally radially for propelling the material through the discharge throat, the wall of said pocket covering portions of the sides of said propeller adjacent said throat, and means for forcing the material sidewise toward the uncovered portions of the sides of the propeller and between the blades.



2,098,247
AUTOMATIC BAG-FILLING AND WEIGHING MACHINE
René Jarrier, Saint-Quentin, France, assignor to Bartlett Arkell, New York, N. Y.
Application March 24, 1932, Serial No. 600,885. Renewed February 17, 1937. In France January 19, 1932
5 Claims. (Cl. 198—128)

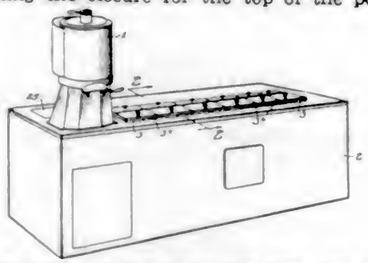
1. In a bag filling machine of the class described, the combination of a hopper having a discharge throat near its lower end and an upwardly opening pocket leading into said discharge throat, a propeller mounted in said pocket having its axis arranged substantially horizontal and its sides arranged in proximity to the sides of the pocket, the upper portion of said propeller projecting above the upper end of said pocket, a cover extending over the upper portion of the periphery of said propeller, and



means for forcing material sidewise between the portions of the blades projecting above said pocket.

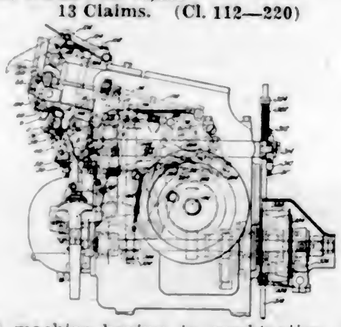
2,098,248
MASTER CONTROL UNIT
Lincoln M. Keefe, Springfield, Mass.
Application July 31, 1931, Serial No. 554,191
51 Claims. (Cl. 235—61.7)

1. In combination with a tabulating machine having a sensing means, an accumulator and machine control means, an electrical relay detachably included in a circuit with the sensing means and the machine control means, and a second relay detachably connected to said sensing means and to said first relay for disabling said circuit and for including said first relay in a circuit with the sensing means and the accumulator.



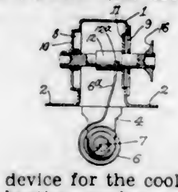
2,098,249
UNIVERSAL BOLT LOCK
Herman H. Kistner, Baltimore, Md., assignor to Kistner Lock and Appliance Company, Baltimore Md., a corporation of Maryland
Application September 18, 1935, Serial No. 41,116
10 Claims. (Cl. 70—141)

1. A rim lock comprising a body having a cylindrical stud projecting from its base and adapted to fit in a corresponding hole in the door style, and a sliding bolt projectable from the body at one side in a direction at right angles to the axis of said stud to engage in a corresponding shaped socket in the door frame, said stud and bolt being of substantially equivalent bending and shearing strength, whereby said body is fixedly secured to the door and frame by its stud and said bolt when the bolt is in projected position.



2,098,250
DEVICE FOR HANDLING FROZEN MATERIAL
James S. Knight, Chicago, Ill.
Application February 6, 1933, Serial No. 655,384
8 Claims. (Cl. 62—114)

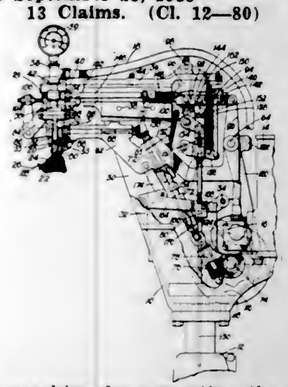
1. A device for handling frozen material comprising a hardening cabinet provided with a space for the containers containing the material, a cooling device extending around said space, a portion of such cooling device projecting over a part of the top of said space and an insulating piece forming the closure for the top of the portion



of the cooling device projecting over the top of said space.

2,098,251
SHOE SEWING MACHINE
Bernard T. Leveque, Wenham, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Original application March 12, 1935, Serial No. 10,621. Divided and this application May 12, 1936, Serial No. 79,281
13 Claims. (Cl. 112—220)

1. A machine having, in combination, devices cooperating to perform an operation, a cam shaft, driving means therefor, separate trains of mechanism for actuating said devices from the cam shaft comprising elements movable to disconnect the actuated devices from the shaft, means for disconnecting the cam shaft from its driving means, means comprising a control member for moving said elements, and means for actuating said control member to disconnect the actuated devices from the shaft while permitting continued rotation of the shaft to final stopping position.

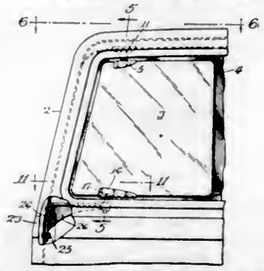


2,098,252
THERMOSTAT CONTROLLED VALVE
James K. Lund, Chicago, Ill., assignor to The Dole Valve Company, Chicago, Ill., a corporation of Illinois
Application September 24, 1934, Serial No. 745,176
9 Claims. (Cl. 236—34)

5. A valve device for the cooling system of an internal combustion engine, comprising a casing having an admission opening and a discharge

opening, a substantially balanced controlling device for said discharge opening, and a bi-metal thermostat for moving said controlling device, whereby the thermostat is rendered independent of the pressure of the liquid in the system.

2,098,253
CHANNEL CEMENTING MACHINE
Wilbur L. MacKenzie, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Original application October 1, 1935, Serial No. 43,064. Divided and this application November 18, 1936, Serial No. 111,453. In Great Britain September 25, 1935
13 Claims. (Cl. 12—80)



1. In a machine for cementing the channels of the soles of lasted shoes, a tapered nozzle adapted to be inserted in the channel of a shoe sole, a driven feed wheel on one side of the nozzle coacting with the upper of a lasted shoe presented thereto to carry the shoe edge past the nozzle, and means located on the other side of the nozzle for holding the flap against the nozzle.

2,098,254
METHOD AND MATERIAL FOR RETARDING OXIDATION AND RANCIDITY IN FOOD SUBSTANCES
Henry A. Mattill and Harold S. Olcott, Iowa City, Iowa, assignors to Lever Brothers Company, a corporation of Maine
No Drawing. Application August 28, 1936, Serial No. 98,342
13 Claims. (Cl. 99—150)

1. The process of obtaining an antioxidant concentrate having at least one hydroxyl group from a lipid and antioxidant containing vegetable substance which comprises extracting the fatty constituents of said substance, separating the antioxidant and lipid containing portion of said fatty constituents, and subjecting said portion to a fractionation treatment to separate said antioxidant from the pigments and sterols contained in said portion.

13. The method of retarding oxidation and rancidity of food materials which comprises adding thereto approximately 0.02% by weight, of an inhibitol having the probable formula $C_{13}H_{14}O_5$, containing at least one phenolic hydroxyl group, and distilling within the range 165–185° C. at 0.1 mm. pressure, and which is soluble in ether, acetone, methyl alcohol and chloroform, substantially free from sterols and pigments and is obtainable by subjecting the unsaponifiable portion of the fatty constituents of lettuce to a fractionation treatment to separate such substance from sterols and pigments.

2,098,255
AIR DEFLECTING DEVICE
Willard L. Morrison, Lake Forrest, Ill.
Application November 20, 1933, Serial No. 698,769
8 Claims. (Cl. 296—84)

4. An air deflecting device for automobiles having a window opening, comprising a deflector element, there being a pivot receiving recess in the bottom of said deflector element, a rotatable pivot having its upper end in said pivot receiving recess, said pivot rotatable about its longitudinal axis, and projecting through the reveal, a bracket under the reveal and fastened to a part of the automobile and having a part which extends under said pivot, the pivot being supported thereon.

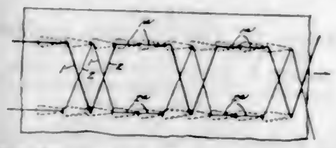
2,098,256
METHOD OF PREVENTING CONTACT SEIZURE OF METAL PARTS
Arthur L. Parker, Cleveland, Ohio
No Drawing. Application August 15, 1934, Serial No. 740,029
5 Claims. (Cl. 91—70)

1. The method of preventing contact seizure of threaded aluminum and like metal parts, consisting in coating the parts, after they have been threaded and subjected to anodic treatment, locally at the threaded portions thereof with a solution including a volatile solvent and lacquer and a stearate of the group consisting of zinc, aluminum and lead stearates which is insoluble in gasoline and motor oils, vaporizing the solvent, and baking to form on the threaded parts a thin adhering protecting coating of the stearate.

2,098,257
FUNGICIDAL AND INSECTICIDAL COMPOSITIONS
Paul Donald Peterson, Newark, Del., assignor to Freeport Sulphur Company, New York, N. Y., a corporation of Delaware
No Drawing. Application September 19, 1934, Serial No. 744,740
17 Claims. (Cl. 167—21)

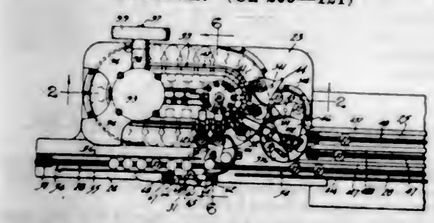
1. A fungicidal composition adapted for use in fungicidal sprays, containing a soluble polysulphide, and a manganese compound in catalytic proportions acting as a sulphur-film forming catalyst.

2,098,258
PROCESS OF MAKING ADHESIVELY-SECURED SEAMED STRUCTURES
William Wallace Rowe, Cincinnati, Ohio, assignor to The Paper Service Company, Lockland, Ohio, a corporation of Ohio
Application December 13, 1932, Serial No. 647,000
11 Claims. (Cl. 229—62)



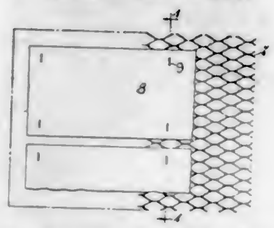
5. In a heavy duty bag or like container having portions at the filling opening thereof adapted

to be lapped and adhesively secured one to another in forming a closure seam, each of said portions being coated with a layer of rubber derived from a rubber dispersion, which layer is adapted to form an autogenous bond with another body of such rubber but is relatively non-adhesive to other substances, said adhesive layers being so positioned with respect to said filling opening as to provide means for completely sealing said



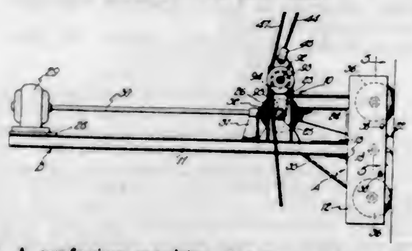
opening, and a protective covering of sheet material disposed over said adhesive coated portions to prevent said portions from being rendered non-adhesive by dust or foreign substances, said material being separable to permit the introduction of contents into said container without removal of said protective covering and being readily removable from said adhesive layers for the purpose of sealing said container.

2,098,259
EMBROIDERED FABRIC
Joseph Schifter, New York, N. Y.
Application January 26, 1933, Serial No. 653,580
3 Claims. (Cl. 112—266)



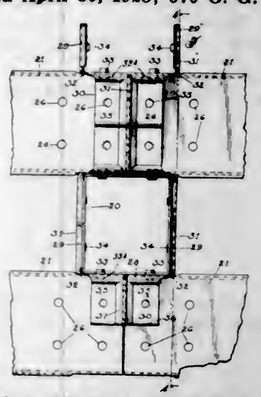
1. An embroidered fabric comprising, in combination, a piece of fabric having embroidered therein composite stitching composed of a pair of threads, said stitching embodying successively interconnected stitches presenting on one face of the fabric stitches disposed in spaced parallel rows and cross-stitches disposed transversely of said spaced parallel rows of longitudinal stitches and intersecting each other intermediate their ends, said stitches being interconnected with each other on the reverse side of the fabric.

2,098,260
FILLED CAN WEIGHING AND SORTING APPARATUS
William Ross Smith, Portland, Oreg., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application December 27, 1933, Serial No. 704,194
19 Claims. (Cl. 209—121)



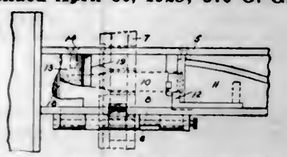
1. In a can weighing machine, the combination of an endless conveyor, scale units carried by said conveyor and adapted to receive and weigh cans, a revoluble turret for receiving said cans after weighing, discharge mechanism carried by said turret for moving the weighed cans successively therefrom, and means actuated by the said scale unit and selectively determined by its weighing position at the time of weighing and in accordance with the weight of the can then in said unit for selectively operating the said discharge mechanism so that the discharge of cans is accompanied by a segregation into groups of the same weight range.

2,098,261
PLASTER BASE
Arthur V. Spinosa, Parkersburg, W. Va., assignor to Penn Metal Company, Parkersburg, W. Va., a corporation of Massachusetts
Application November 22, 1933, Serial No. 699,104
6 Claims. (Cl. 72—116)



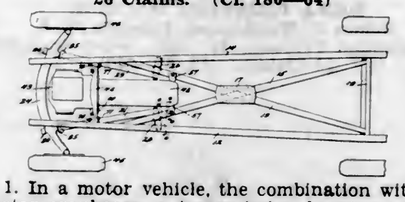
1. A plaster base comprising a sheet of expanded metal lath and a backing therefor secured thereto at spaced intervals and consisting of paper board, said board being of lesser weight per unit area than and possessing an inherent stiffness at least as great as that of said lath and thereby substantially reinforcing the latter, and having an elasticity permitting the board to yield under pressure sufficiently to allow the plaster to cover the lath and key itself thereto.

2,098,262
SURFACING MACHINE
John C. Temple, New York, N. Y.
Application December 13, 1935, Serial No. 54,186
5 Claims. (Cl. 114—222)



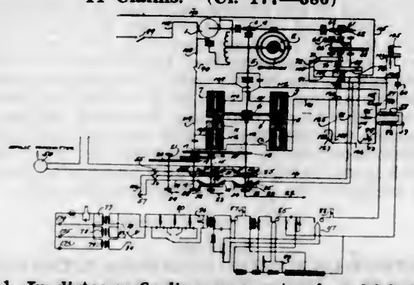
1. A surfacing machine for use upon vertical or inclined surfaces comprising in combination, an arm, a traction work head at one end of said arm, a counterbalance weight at the other end of said arm, a horizontally disposed track adapted to be supported above the surface to be worked upon, a trolley carriage movable over said track, a driven rotatable drum mounted on said arm, and block and tackle means operatively connecting said trolley carriage and said driven rotatable drum for suspending, controlling and guiding the machine with the counterbalance weight over balancing said traction work head, to cause the latter to engage a surface to be worked upon.

2,098,263
CRIBBING SADDLE
Frederick J. Trumpour, Forest Glen, Md.
Application October 8, 1936, Serial No. 105,521
5 Claims. (Cl. 61—47)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



1. A cribbing structure comprising stretcher and header units having rectangular portions in cross section, a plurality of apertures arranged in the faces of said rectangular portions, a saddle having a plate portion adapted to lie in a substantially horizontal position between the rectangular end portions of adjacent stretchers and a rectangular portion of a header, said plate portion having lugs projecting in opposite directions adapted to engage apertures in said stretchers and header to prevent movement of the ends of the stretchers longitudinally of the header and the separation of the ends of said stretchers, pairs of spring locking members extending vertically in opposite directions from said plate portions a distance equal to one-half the vertical cross section of the rectangular portion, having lugs adapted to engage apertures in the rectangular portions of said stretchers and header to prevent relative movement of said parts, flanges arranged at the ends of said spring locking members adapted to come into contact with corresponding flanges on adjoining saddles to relieve the crushing effect on the stretchers and header.

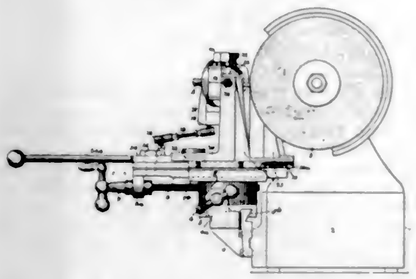
2,098,264
CARTRIDGE STOP FOR MACHINE GUNS
Norman K. Turnbull, Philadelphia, Pa.
Application April 28, 1937, Serial No. 139,490
4 Claims. (Cl. 89—33)
(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)



1. In an automatic firearm, a receiver casing having a transverse cartridge feedway, a block in the front end of the feedway and at one side thereof, said block formed with a partially cylindrical groove disposed longitudinally of the gun, the upper portion of the block above the groove extended to provide a lip, and the block being so positioned that the portion of its rear face marginally defining the groove will be engaged by the front face of a cartridge case that is positioned for extraction from the feedway.

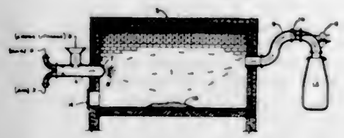
2,098,265
MOTOR VEHICLE
Cornelius W. Van Ranst, Detroit, Mich., assignor to Packard Motor Car Company, Detroit, Mich., a corporation of Michigan
Application March 21, 1932, Serial No. 600,345
26 Claims. (Cl. 180—64)

1. In a motor vehicle, the combination with a motor crankcase, a transmission housing adjacent said crankcase, a supporting member positioned intermediate said crankcase and housing and secured thereto, a vehicle body frame comprising a pair of longitudinally extending side frame members, cross frame members connecting said side frame members, each cross frame member extending from a point adjacent the forward end of one side frame member to a point adjacent the rearward end of the other side frame member, said side frame members and cross frame members extending forwardly of said supporting member and being secured thereto.



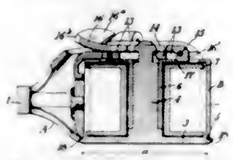
2,098,266
DISTANCE FINDER
William L. Walker, New York, N. Y.
Application December 28, 1929, Serial No. 417,122
11 Claims. (Cl. 177—386)

1. In distance finding, apparatus by which the time elapsing between the occurrence of a primary signal and the receipt of a complementary signal is indicated by a rotatable indicator, the improvements which comprise, sound-receiving devices, a rotatable indicator, rotatable driving means therefor, a separable connection between said driving means and said indicator, said connection comprising an electric clutch which includes an electro-magnetic member continuously rotated by said driving means, a resiliently and swayably supported annular armature carried rotatably in close proximity to said electro-magnetic member and having positive connection with said indicator, a fixed electro-magnetic member or stator mounted opposite and close to said armature, an energizing circuit for said rotary magnetic member that is closed substantially simultaneously with the occurrence of the primary signal to attract said armature for making said driving means operative to cause said



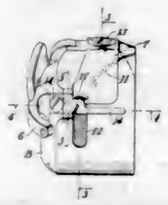
armature and said indicator to move in proportion to the time that elapses after the occurrence of the primary signal, and means actuated by the sound receiver for de-energizing said rotatable electro-magnetic member and for energizing said stator member to stop the motion of said armature and said indicator upon the receipt of said complementary signal.

2,098,267
DRILL GRINDING MACHINE
Robert C. Weishampel, Paterson, N. J.
Application February 18, 1935, Serial No. 6,925
10 Claims. (Cl. 51—219)



7. A drill grinding machine having a grinder wheel, a supporting table, and a mechanism for presenting the drill to the grinder, of the type comprising in combination a carrier shiftable on the table relatively toward and from the grinder, a cradle carried wholly upon the carrier and pivoted to rock thereon, a chuck adapted to hold the drill and journaled on the cradle to turn on an axis slanting to the grinding face at an angle determined by the cutting-edge-angle of the drill, such cradle and chuck axes being at substantial angles to each other, an operating lever or actuator, a connection operated by the throw of the lever to shift the carrier toward the grinder, and connections operated by the throw of the lever to rock the cradle and turn the chuck in coordination with the shift of the carrier; and such combination being characterized in that the chuck is journaled on the cradle by circular bearing members on each, surrounding the drill.

2,098,268
METHOD OF MAKING SUBLIMED LITHARGE
Bernard S. White, Hammond, Ind., assignor to The Glidden Company, Cleveland, Ohio, a corporation of Ohio
Application September 26, 1934, Serial No. 745,601
2 Claims. (Cl. 23—146)

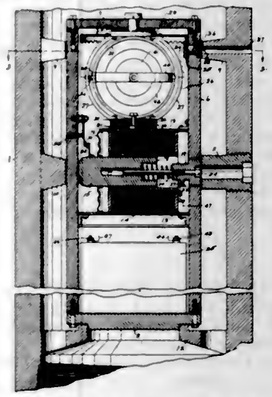


1. The process of making litharge and sublimed litharge, which comprises mixing air, a combustible gas and lead oxide bearing powder before ignition, burning the mixture in a furnace whose lower portion is maintained at or below 1,325° F., collecting litharge on the floor of the furnace, drawing the sublimed litharge through a flue maintained at or above 1,050° F. and separating the sublimed litharge from the flue gases.

2,098,269
SEWING MACHINE SHUTTLE
Alfred R. Wood, Bridgeport, Conn., assignor to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey
Application January 2, 1937, Serial No. 118,845
2 Claims. (Cl. 112—232)

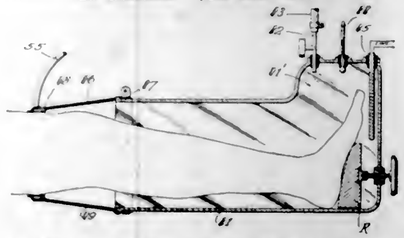
1. In a sewing machine, the combination with a stationary cup-shaped bobbin-case having at its open end a circular rim and having within it a tubular bearing element coaxial with said rim, of a circularly moving shuttle-body having an arbor on which said bearing element is freely journaled and a rear wall which carries said arbor and is formed in its inner face with a completely circular groove of substantially the same diameter as the rim of the thread-case and in juxtaposition with said rim.

2,098,270
BOBBIN-THREAD CASE FOR SEWING MACHINES
Alfred R. Wood, Bridgeport, Conn., assignor to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey
Application January 2, 1937, Serial No. 118,846
8 Claims. (Cl. 112—233)



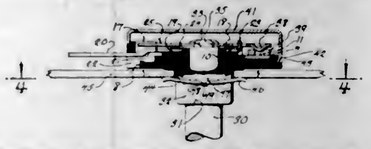
1. A bobbin-thread case, for sewing machines, having a cylindrical cup-shaped body, a free ended tension leaf-spring applied circumferentially to the cylindrical wall of said body, and a thread-guide applied to the cylindrical wall of said body independently of said tension spring and disposed immediately adjacent the free end of the latter.

2,098,271
DEVICE FOR ORIENTING WHIP STOCKS
Ovide Bares, Sulphur, and Roy I. Bares, Vinton, La.
Application July 23, 1936, Serial No. 92,092
10 Claims. (Cl. 255—1)



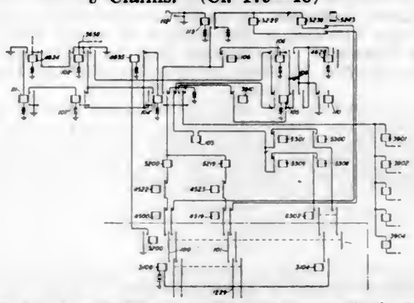
1. In a device of the character described, a housing, an impact member reciprocable in the housing, an electro-magnet for retracting the impact member, mechanical means for actuating the impact member, a source of electrical energy, a circuit leading from said source through said

electro-magnet, means for completing the circuit to effect retraction of said member and for



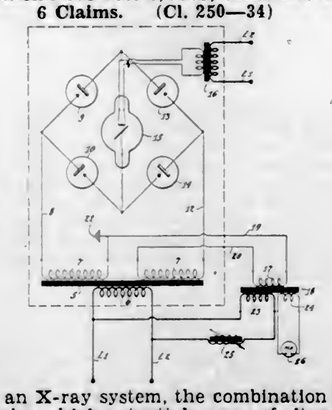
breaking said circuit to permit actuation of said member.

2,098,272
THERAPEUTIC APPARATUS
Simon Benson, Chicago, Ill.
Application March 25, 1935, Serial No. 12,863
19 Claims. (Cl. 128—38)



1. A device of the character set forth comprising a chamber, a cover for said chamber provided with an opening the size and shape of a human arm, a concave annular wall fitting into said opening, a section of foraminous material forming a part of said concave wall, an outer annular wall surrounding said inner wall forming a recess intermediate the walls, and means for reducing the pressure within said recess.

2,098,273
RHEOSTAT
Harry L. Bradley and Ferdinand J. Haas, Milwaukee, Wis., assignors to Allen-Bradley Company, Milwaukee, Wis., a corporation of Wisconsin
Application June 9, 1933, Serial No. 675,006
20 Claims. (Cl. 201—55)



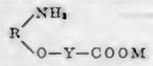
1. A rheostat comprising a base, a resistor embedded in the base with one surface exposed, a terminal for the resistor partially embedded in the base and having a part overlying and contacting the exposed surface of the resistor, a shaft journalled in the base, a contactor to traverse the resistor, a terminal for the contactor in electrical engagement therewith and partially embedded in the base, the embedded portions of said terminals being disposed under the contactor, and means to attach the contactor to the shaft in a position bearing down on said embedded portion of the terminals whereby the contactor secures the resistor and both terminals assembled with the base.

2,098,274
TELEPHONE SYSTEM
Warren W. Carpenter, Garden City, and Oscar Myers, Brooklyn, N. Y., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application January 29, 1937, Serial No. 122,973
9 Claims. (Cl. 179—18)

1. In a telephone system, a control device, means for seizing said device, testing means in said device, timing means started when said device is released and means for preventing the operation of said testing means if said device is reseized before said timing means completes its operation.

2,098,275
X-RAY MEASURING SYSTEM
Benedict Cassen, Detroit, Mich., assignor to Westinghouse X-Ray Company Inc., a corporation of Delaware
Application November 6, 1935, Serial No. 48,469
6 Claims. (Cl. 250—34)

1. In an X-ray system, the combination of an X-ray tube, a high potential source of alternating current electrical energy connected to said X-ray tube for energizing the same with the loading energy supplied to said X-ray tube having an in-phase current-voltage characteristic and said source also having a no-load out-of-phase current



voltage characteristic, means connected to said source and to said X-ray tube to cause only unidirectional electrical energy to be supplied to said X-ray tube, means electrically connected to said high potential source for neutralizing the no-load out-of-phase current-voltage characteristic thereof so that the energy supplied to said last mentioned means is proportional to the loading energy supplied to said X-ray tube, and means connected to said last mentioned means for indicating only the current supplied to the latter which is representative of the useful current actually supplied to said X-ray tube.

2,098,276
AZO DYES AND METHODS FOR THEIR PREPARATION

Samuel Coffey, Morvan Lapworth, and Wilfred Archibald Sexton, Blackley, Manchester, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain

No Drawing. Application May 11, 1935, Serial No. 20,982. In Great Britain November 30, 1932
12 Claims. (Cl. 260—91)

1. A process for the manufacture of new azo compounds which comprises coupling a compound including the radical of a diazotized aromatic amine, with a coupling component containing in its structure the radical

wherein R stands for an aryl radical of the benzene series, Y for a member selected from the group consisting of the radical CH_2, CH(alkyl) and C(alkyl)$_2$, and M for an alkali metal, the groups NH_2 and O—Y—COOM being located in ortho position to each other.

2,098,277
RUBBER HEEL

Rocco Conticchio, Mount Vernon, N. Y., assignor of one-half to John W. Guzzetta, Mount Vernon, N. Y.

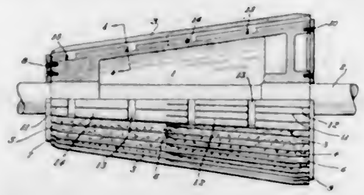
Application April 20, 1937, Serial No. 137,973
2 Claims. (Cl. 36—35)

1. In combination with a conventional heel provided with a depression in its outer surface, a rubber heel including a main body portion, cupped marginal portions formed with said main body portions, a locating platform rising from the inner surface of said main body portion and extending into the depression in the conventional heel, and means to affix said main body portion to the conventional heel and hold the same in a flexed position.

2,098,278
MANUFACTURE OF TITANIUM PIGMENTS

Roy Dahlstrom, East Orange, and Lonnie W. Ryan, Westfield, N. J., assignors, by mesne assignments, to National Lead Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application November 9, 1933, Serial No. 697,304
16 Claims. (Cl. 23—202)



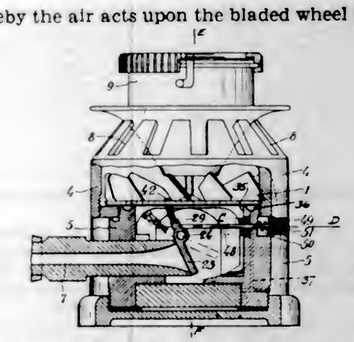
12. In a method of producing hydrous titanium oxide nuclei, the step which consists in mixing alkali-precipitated titanium compounds and an aqueous solution of sulphric acid and a compound selected from the group consisting of sodium sulphate, sodium chloride, magnesium sulphate and sodium nitrate to dissolve said alkali-precipitated titanium compounds therein.

14. In a method of producing hydrous titanium oxide nuclei, the step which consists in heating a solution of alkali-precipitated titanium compounds having a hydrogen ion concentration of pH=1.0 to pH=less than 2.0 at a sufficiently high temperature and for a sufficient length of time to precipitate therein by hydrolysis permanent macroscopic hydrous titanium oxide nuclei.

2,098,279
BANDLESS JORDAN PLUG

Alfred Dorman, Pittsfield, Mass., assignor to E. D. Jones & Sons Company, Pittsfield, Mass., a corporation of Massachusetts

Application December 5, 1934, Serial No. 756,025
5 Claims. (Cl. 92—27)

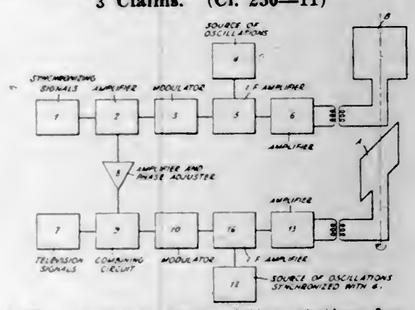


1. In a machine of the class described, and in combination, a forwardly tapered frusto-conical plug having full-length peripherally spaced supporting slots and part-length rearward supporting slots between said full-length slots, encircling grooves at right angles to the supporting slots, and undercut shoulders extending rearwardly from the forward walls of said peripheral slots, ribbed grinding bars seated in said slots and having lateral projections engaged under said shoulders, forward filler blocks between the bars in the full-length slots and with rearward ends abutting the forward ends of the grinding bars seated in the part-length slots, rearward filler blocks between the bars seated in the part-length slots and those seated in the full-length slots, cover plates closing off the interior of the plug at each end and extending radially beyond the plug surface so as to hold the grinding bars and filler blocks against motion endwise of the plug, said filler blocks being complementarily grooved to engage the ribbed grinding bars by forward motion along the plug.

2,098,280
SPIROMETER

Hugo Dornseif, Radevormwald, Germany

Application May 20, 1936, Serial No. 80,793
In Germany March 9, 1934
15 Claims. (Cl. 128—2.08)

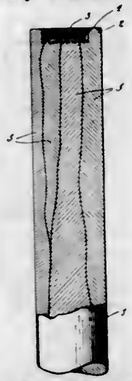


1. In a spirometer the sub-combination of a housing; a bladed wheel in said housing; a counting mechanism operatively connected with said bladed wheel; a helical guide conduit for supplying air to said bladed wheel; and a collecting chamber for the moisture deposited in said conduit by centrifugal force, connected to said guide conduit at its lowest part, said guide conduit being arranged coaxially with the bladed wheel and opening immediately on to the bladed wheel, whereby the air acts upon the bladed wheel in the helical direction of flow imparted to its by the guide conduit.

2,098,281
WIRELESS DIRECTION FINDING SYSTEM

Harry Melville Dowsett, Winchmore Hill, London, and Louis Edward Quintrell Walker, Maida Vale, London, England, assignors to Radio Corporation of America, a corporation of Delaware

Application March 20, 1934, Serial No. 716,474
In Great Britain March 31, 1933
3 Claims. (Cl. 250—11)

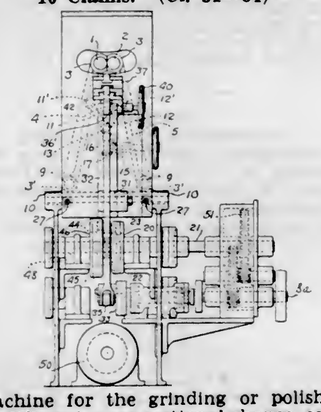


1. In a wireless transmitting station for use for direction finding, television apparatus for transmitting television signals representative of a characteristic subject, including a directional indication, means for transmitting accompanying signals for synchronization, a plurality of directive antenna systems the directivity of which may be varied according to variations in the directional indications to be transmitted, means for energizing one of said antenna systems with carrier energy modulated with the television signals, a source of synchronizing signals, and means for energizing all of the said directive systems with carrier energy modulated with said synchronizing signals.

2,098,282
CLAD METAL BODY

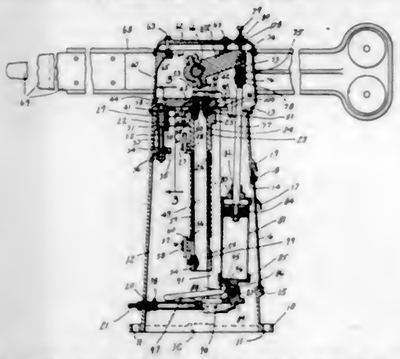
Frank H. Driggs, Highland Park, Ill., assignor, by mesne assignments, to Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania

Original application February 6, 1932, Serial No. 591,300. Divided and this application April 20, 1935, Serial No. 17,469
7 Claims. (Cl. 250—35)



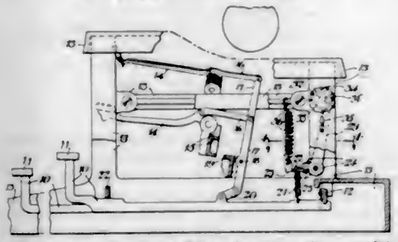
1. A clad metal comprising a body of metal having a relatively high melting point and another body of metal having a relatively low melting point, the quantity of said low melting point metal being materially in excess of that of said high melting point metal, said metals being contiguous, the joint at the place of contiguity being a firm, tenacious, mechanical union of said two metals, said union having high thermal and electrical conductivity characteristics said low melting point metal being free from oxides and containing no voids and having the longitudinal axes of its crystal structure adjacent the relatively high melting point metal perpendicular to the greatest surface area thereof to increase the tenacity of the mechanical union therebetween.

2,098,283
APPARATUS FOR POLISHING RAZORS AND OTHER ARTICLES



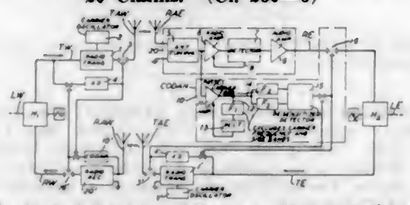
Carl Friedrich Ern, Jr., Solingen-Wald, Germany

Application March 28, 1936, Serial No. 71,389
In Germany April 2, 1935
10 Claims. (Cl. 51—84)



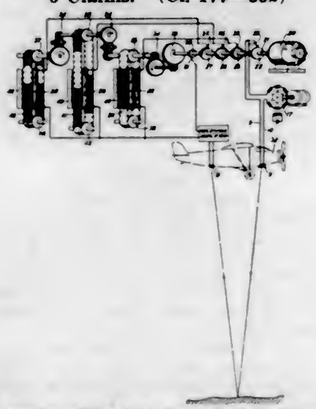
1. Machine for the grinding or polishing of tools of different cross sectional shapes, comprising grinding wheels arranged at opposite sides of a central grinding plane, two adjustable levers, bearings in said levers for the grinding wheels, pivot bearings for the levers, and means for swinging the levers to move the wheels through circular arcs of comparatively slight curvature, the distance between the wheel bearing and the pivot bearing in each lever being substantially greater than the distance between the latter bearing and the said grinding plane, and the latter distance having such a ratio to the length of each lever that the point of contact of the grinding wheel with the tool remains constant in height for grinding wheels of different diameters.

2,098,284
GATE CONSTRUCTION
James H. Fraser, Louisville, Ky.
Application May 22, 1933, Serial No. 672,267
7 Claims. (Cl. 39—7)



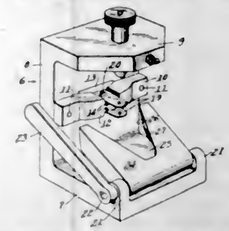
1. The combination with a gate arm, a horizontally turnable, gate arm supporting head, a rock shaft carried by the head and arranged for tilting said gate arm, a head supporting pedestal structure, of a shaft rotatably supported at the upper end by a pedestal structure and rigid with the head, means operatively associated with the head and the pedestal including a spring mounted on said second mentioned shaft for returning said head to predetermined position when released from a constraining head turning force, a cylinder and piston construction operatively connected at one end to the rock shaft, and a fluid pressure supply connected to said construction for causing relative movement between the elements thereof to secure gate arm tilting movement, of means independent of the second mentioned shaft and carried by said head and supporting said construction.

2,098,285
TYPEWRITING MACHINE
Carl Gabrielson and Edson George Moshier, Syracuse, N. Y., assignors to L C Smith & Corona Typewriters Inc., Syracuse, N. Y., a corporation of New York
Application August 30, 1935, Serial No. 38,520
9 Claims. (Cl. 197—33)



5. A typewriting machine having, in combination, a set of type actions having operating keys, a set of contractile return springs for said actions, a shiftable device to which and to said actions the opposite ends of said set of springs are connected and which device is supported for shifting movement thereof which will simultaneously and uniformly vary the lengths of the springs, a member supported to turn in contactive engagement with said device about a fixed axis and in a fixed plane, the contactive parts of said member and device being effective to hold said device in different shifted positions varied by the turning of said member and to positively limit turning of said member in both directions about its axis, and a handle connected with said member for turning of the latter in opposite directions by the handle.

2,098,286
TRANSMISSION CONTROL IN SIGNALING SYSTEMS
Owen R. Garfield, Floral Park, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application July 31, 1936, Serial No. 93,584
20 Claims. (Cl. 250—6)



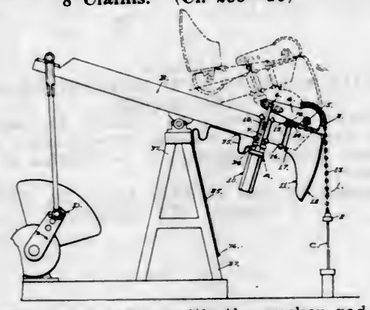
1. A receiving circuit for a carrier wave signaling system subject to static, comprising a signal demodulating path normally disabled in its output, a wave-operated switching circuit responsive to the received carrier waves to remove the disability from said path while signals are being received, and means to minimize the effect of static on the operation of said switching circuit comprising one static controlled means unresponsive to received carrier waves for suppressing from said signaling circuit the slow variations in static and another means for substantially suppressing therefrom the fast variations in static while controlling the sensitivity of said switching circuit in accordance with the applied static variations so as to maintain it at all times at maximum sensitivity to the carrier waves for the amount of static present.

2,098,287
SYSTEM OF INDICATING DISTANCE
Edgar W. Gent, Morristown, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 21, 1935, Serial No. 55,589
5 Claims. (Cl. 177—352)

1. A sonic altimeter for airplanes comprising means for transmitting a longitudinal wave at predetermined intervals, a plurality of gaseous space discharge devices corresponding to different ranges of distances to be indicated, means responsive to said waves after passing through a molecular medium for selectively discharging one of said devices to indicate the particular range of distances traveled by said longitudinal wave, and means associated with each of said devices for indicating the distance within said range through which said longitudinal wave has traveled.

2,098,288
HEEL DRILLING FIXTURE
Hiram Gordon and Albert C. Rogge, Columbus, Ohio, assignors to Perma Corporation, Chicago, Ill., a corporation of Illinois
Application May 23, 1936, Serial No. 81,477
10 Claims. (Cl. 12—42)

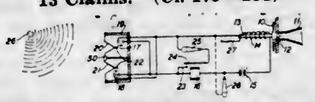
1. A drill fixture comprising a frame formed to include horizontally disposed top and bottom walls and a connecting vertical wall, a horizontally extending saddle carried by said vertical wall, said saddle including a gaging face, horizontally adjustable work positioning means movably carried by said vertical wall and saddle, said means projecting beyond said gaging face, a work supporting tongue projecting horizontally from said saddle, pivoted clamping means carried by the bottom wall of said frame for maintaining a body to be drilled on said tongue and in engagement with said adjustable positioning means, and a vertical drill guide carried by the top wall of said frame in registration with said tongue.



2,098,289
PROCESS FOR THE CATALYTIC SYNTHESIS OF AMINES
Crawford H. Greenewalt, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application July 13, 1934, Serial No. 734,928. In Great Britain October 13, 1932
14 Claims. (Cl. 260—127)

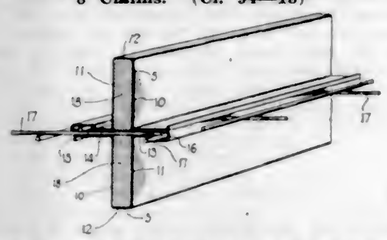
1. A process of making lower alkyl amines, which comprises catalytically synthesizing the amines at a pressure in excess of 100 lbs. per square inch and then directly fractionating the reaction product at substantially the same superatmospheric pressure to separate the components.

4. A process of making lower alkyl amines, which comprises passing a vapor comprising essentially ammonia and a lower alkyl alcohol, in proportions sufficient to react to form amines over an amination catalyst at a temperature within the range of 300° to 500° C. and cooling the resulting vapors, while maintaining the system under a pressure in excess of 100 lbs. per square inch sufficient to liquefy the vapors in the cooling step, and while maintaining that pressure constant by periodically bleeding the vapor system, said pressure being substantially the same in both the catalytic step and in the cooling step.



12. A process of making dimethylamine, which comprises creating a pressure on a liquid mixture consisting of approximately 28% ammonia, 12% monomethylamine, 40% trimethylamine and 20% methyl alcohol, of about 230 lbs. per square inch, heating said liquid mixture to vaporize same, preheating the vapor to about 380 to 390° C., passing the preheated vapor over an amination catalyst heated to about 400 to 410° C.; cooling the reaction products, passing the cooled products into a rectifying column and thereby separating from the amines formed the unreacted ammonia in the form of an azeotropic mixture of ammonia and trimethylamine, cooling this ammonia-trimethylamine azeotrope to condense same, while maintaining the entire system under a constant pressure of about 230 lbs. per square inch, separating the monomethylamine and trimethylamine from the amines formed and recycling these two amines together with the ammonia to help make up the initial liquid mixture.

2,098,290
SUCKER ROD IMPULSE AND IMPACT DAMPENER
James Carl Hinkle and Frederick Edmund Scheider, Los Angeles, Calif.; said Scheider assignor to said Hinkle
Application June 8, 1936, Serial No. 84,178
8 Claims. (Cl. 255—16)

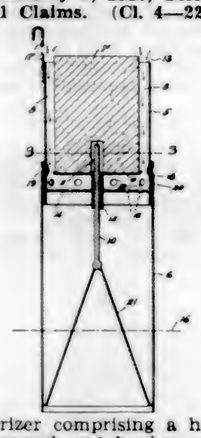


1. The combination with the sucker rod and sucker rod operating member of oil well pumping equipment, of means of operative connection between said rod and said member including a cylinder fixed on said operating member, a piston in said cylinder, means connecting said piston with the sucker rod including a lever pivoted on said operating member, and a compressible gas in said cylinder resiliently resisting movement of said piston.

2,098,291
SOUND TRANSLATING APPARATUS
Harris F. Hopkins, Bogota, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application January 30, 1937, Serial No. 123,219
13 Claims. (Cl. 179—184)

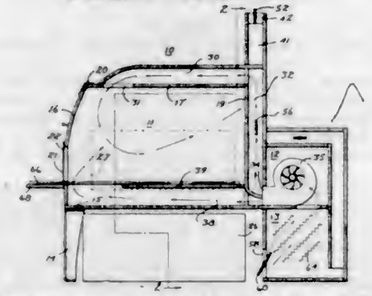
1. Sound translating apparatus comprising a diaphragm, means defining a sound passageway in communication with said diaphragm, a movable plug member in said passageway, electromagnetic means for moving said plug member to open or close said passageway, and a control circuit for said electromagnetic means.

2,098,292
EXPANSION JOINT
James H. Jacobson, Chicago, Ill.
Application February 9, 1935, Serial No. 5,792
8 Claims. (Cl. 94—18)



8. In a road joint having a pair of metallic walls, the combination with a pair of adjoining slabs and with the joint, of a reinforcing member for carrying the applied load across the joint, a pair of flanges formed of the material of the joint, said reinforcing member spanning the joint and being embedded within and anchored directly to one of the adjoining slabs and slidably retained in the next adjoining slab by being enclosed within and having bearing on one of said flanges which is integral with and is an extended portion of said joint, and which portion of said joint is embedded within and anchored to said last mentioned slab.

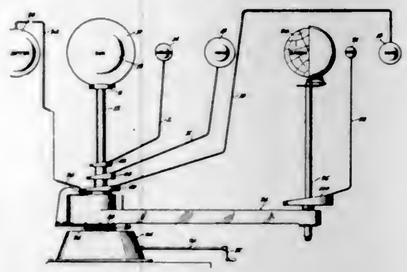
2,098,293
DUSTLESS GRITS, AND METHOD OF MAKING SAME
Frederick L. Jefferies, La Grange, Ill., assignor to International Patents Development Company, Wilmington, Del., a corporation of Delaware
Application July 18, 1934, Serial No. 735,742
4 Claims. (Cl. 127—32)



4. A corn starch product, of the type produced by subjecting the starch to heat and pressure in the presence of water, consisting of raw starch, the granules of which are intact, with some gelatinized starch in such proportion that the product gives a blue or raw starch reaction when subjected, without pre-pasting, to the Goob test, aggregated in the form of dustless flakes, containing not substantially more than 2.7% soluble substances, and containing substantially no nonstarch substances nor horny, insoluble particles of gelatinized starch, whereby the flakes are capable of being pasted, with substantial completeness, for malting.

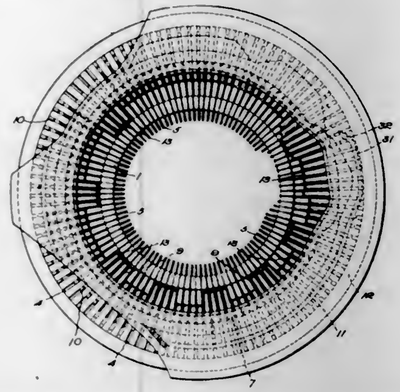
2,098,294
DEODORIZER
Joseph Dempster Keillor, Aylmer, Ontario, Canada
Application January 2, 1937, Serial No. 118,767
11 Claims. (Cl. 4—228)

1. A deodorizer comprising a hollow cylinder vertically arranged and having an open upper end, an imperforate tray horizontally supported therein circumposed by a vapor passage, said tray being adapted to seat a chemical compound for which the surrounding cylinder forms a container having an intervening air passage in communication with the aforementioned vapor passage, and means providing for lateral diffusion of vapor from the cylinder.



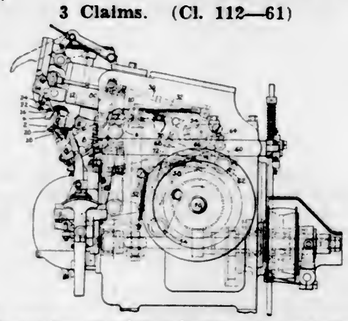
2,098,295
METHOD OF AND APPARATUS FOR CREATING AN ARTIFICIAL FEVER
Charles F. Kettering and Edwin C. Sittler, Dayton, Ohio, assignors, by mesne assignments, to General Motors Corporation, a corporation of Delaware
Application March 17, 1933, Serial No. 661,210
Renewed September 17, 1937
4 Claims. (Cl. 128—373)

1. Process comprising subjecting a human body to the effect of a high frequency field to create a fever in said body and at the same time maintaining the body substantially dry.



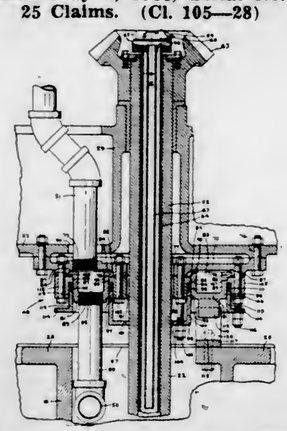
2,098,296
PLANETARIUM
Benjamin A. La Grasse, Brooklyn, N. Y.
Application January 2, 1937, Serial No. 118,737
11 Claims. (Cl. 35—45)

1. In a planetarium, a source of light representative of light from the Sun, a rotatable light transmitting globe surrounding said source to represent the Sun's surface, a sphere representing a body in the solar system, means for rotating said globe and for causing said sphere to revolve around said globe with a rotational speed differ-



ent from that of said globe, and means revolving around said light within said globe, independently of the revolution of said globe, for projecting a beam of light from said source onto said sphere while the latter revolves around said globe.

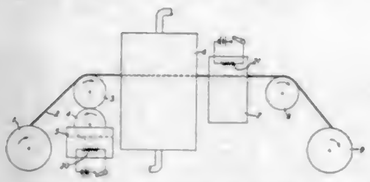
2,098,297
MECHANISM AND PROCESS FOR EFFECTING REVERSE PLATING BY NEEDLE DEFLECTION
John Lawson and Robert H. Lawson, Pawtucket, R. I., assignors to Hemphill Company, Central Falls, R. I., a corporation of Massachusetts
Application May 26, 1927, Serial No. 194,504
3 Claims. (Cl. 66—36)



1. In a circular knitting machine, a circular series of independent needles to which two threads are adapted to be fed in a plating relation, slotted supports, web holders operable between said needles and sliding in slots in said support, jacks each associated respectively with a web holder and slidable parallel to said web holders in slots in said support and adapted to engage the needle shanks to deflect the same at their loop forming ends, and means on the hook side of the needles for causing said jacks to deflect predetermined needle shanks sufficiently to cause a change in the plating relation of the two threads with continued feeding of both threads to the selectively deflected needles and pattern means for acting upon said jacks.

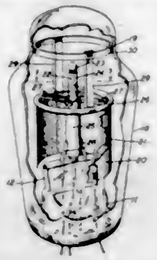
2,098,298
SHOE SEWING MACHINE
Bernard T. Leveque, Wenham, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Original application March 12, 1935, Serial No. 10,621. Divided and this application May 12, 1936, Serial No. 79,283. Renewed February 13, 1937
3 Claims. (Cl. 112—61)

1. A sewing machine having, in combination with the stitch forming devices, a work support, a presser-foot, means for pressing the presser-foot yieldingly against the work, a rock shaft, a driving clutch member secured to the shaft, a driven clutch member, connections from the driven clutch member to the presser-foot, and means for rocking the rock shaft in one direction to release the driven clutch member, and in the other direction to move the driven clutch member to clamp the presser-foot on the work.



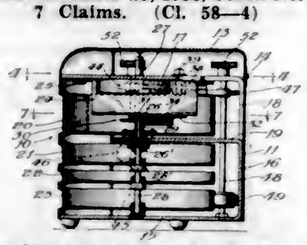
2,098,299
CRANE
Rolf E. Ljungkull, St. Paul, Minn., assignor to American Hoist and Derrick Company, St. Paul, Minn., a corporation of Delaware
Application May 2, 1936, Serial No. 77,555
25 Claims. (Cl. 105—28)

1. In a machine of the character described, a car body, a platform thereon, a vertical shaft about which said platform is revolvable, steam actuated mechanism on said platform, a different car body, a source of steam supply on said different car body, and means for conveying steam from said source of steam supply to said steam actuated mechanism, said means including a swivel joint consisting of a member surrounding said



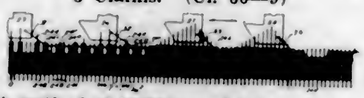
vertical shaft and secured to said platform, a second member surrounding the vertical shaft and rotatably supported by the member first mentioned to provide a chamber between said member and said second member, a steam connection leading from said source of steam supply by way of said second member to said chamber, a steam connection leading from said chamber by way of said member to said steam actuated mechanism, and a device between the second member and car body and secured upon said car body for precluding rotation of said second member with respect to said car body, said device having engagement with said second member.

2,098,300
ELECTRIC WELDING
David T. May, Port Washington, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application August 8, 1935, Serial No. 35,234
5 Claims. (Cl. 148—6)



1. The method of preparing sheet metal for welding which comprises covering one surface with a protective coating, and subjecting said sheet to a chemical reaction to produce on the other surface thereof a substance having a conductivity different from that of the metal itself.

2,098,301
GLOW DISCHARGE DEVICE
Hallam E. Mendenhall, Summit, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application October 3, 1935, Serial No. 43,296
8 Claims. (Cl. 250—27.5)

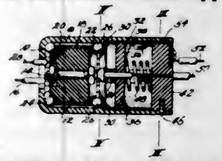


8. A glow discharge device comprising an enclosing vessel having a stem and a dome opposite said stem, a cylindrical cathode above said stem, an anode in cooperative relation with said cathode, a control electrode including an annular member adjacent the end of said cathode remote from said stem and a tubular member within said cathode, means engaging said tubular member for supporting said control electrode from said stem, and bracing means for said control electrode including an insulating member connected to said annular member and engaging the inner wall of said dome.

2,098,302
COMBINATION CLOCK AND CALENDAR
Joseph C. Morris, Chicago, Ill.
Application November 25, 1936, Serial No. 112,674
7 Claims. (Cl. 58—4)

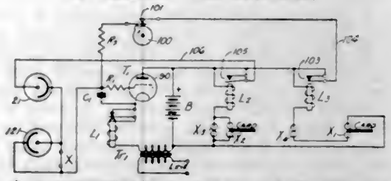
7. A combination clock and calendar comprising a casing having a plurality of openings in its face, clock mechanism in the casing, a driven shaft projecting from the clock mechanism in the casing, a drum mounted on said driven shaft, the drum carrying hour and minute designations on its peripheral surface, operative connections between the driven shaft and said drum for causing the drum to make two complete revolutions in twenty-four hours, a stub shaft in the casing aligned with said driven shaft, a series of drums loosely mounted on said stub shaft concentrically with said first mentioned drum and carrying day of the week and day of the month designations on their respective peripheral surfaces, and means for actuating the drums of said series.

2,098,303
METHOD OF KNITTING FABRIC
Charles Moses, New York, N. Y.
Application April 26, 1937, Serial No. 138,970
3 Claims. (Cl. 66—9)



1. A method of knitting a fabric upon a sinker top knitting machine with sinkers having two steps characterized by the following sequence of operations, namely, elevating needles so that the latches of said needles are below the upper step of said sinker, the already formed stitch loops holding said latches against the shanks of the needles, feeding an inlay thread to the hooks of said needles and drawing said needles down so that the hooks are below said step while said inlay thread rests within the throat of said step, elevating needles so that the latches clear said inlay thread, feeding a weft thread to the hooks of said needles and drawing said needles down so that said hooks are below the upper sinker step thus casting off said inlay thread but not the already formed stitch loops while said weft thread rests within the throat of said step, elevating needles so that the latches clear said weft thread, feeding a knitting thread to the hooks of said needles, withdrawing said sinkers whereby the already formed stitch loops drop to the lower sinker step, drawing said needles down to cast off said weft thread and the already formed stitch loop.

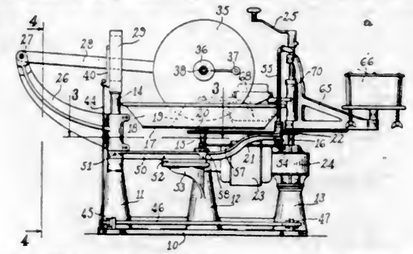
2,098,304
SWIVEL CONNECTER
Louis G. Nakich, Kansas City, Mo.
Application September 23, 1935, Serial No. 41,687
1 Claim. (Cl. 173—324)



A swivel connecter of the character described comprising a case of non-conducting material;

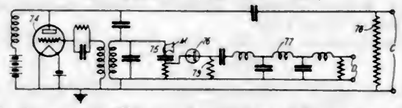
an assembly movable as a unit about an axis within the case having a body of non-conducting material, an axially extending pin of conducting material therethrough, a ball race formed of conducting material at each end of the body, and wires in connection with the said pin and ball race; another ball race formed of conducting material in opposed relation with the innermost ball race of the movable assembly; balls of conducting material in said opposed races; a

wire in connection with said last mentioned ball race; a contact pin of conducting material having a wire in connection therewith in frictional engagement with the first mentioned pin; a spring to urge the contact pin toward the said first mentioned pin; a holder of non-conducting material for said contact pin and associated spring; and another spring yieldably securing said holder in place with the pins in frictional engagement.



2,098,305
COMMUNICATION SYSTEM
Harry J. Nichols, Binghamton, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application September 23, 1936, Serial No. 102,112
19 Claims. (Cl. 164—115)

1. A communication system of the character described for use with a tabulating card containing a plurality of columns each having a plurality of positions for indications thereon, means including light responsive means for scanning the positions of each column and successive columns, a single communication circuit, means for transmitting a signal in accordance with the position of each of said indications over said communication circuit, a recorder, means for receiving said signals, the recorder having a blank card corresponding to said tabulating card, means for moving said blank card intermittently through successive columns, and means controlled in response to said signals for reproducing indications on said blank card corresponding to the respective positions of said indications on said tabulating card.

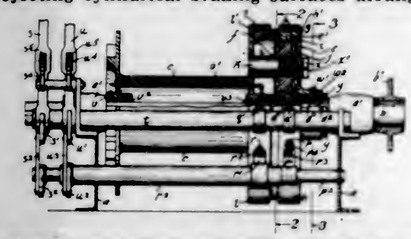


2,098,306
APPARATUS FOR APPLYING ABRASIVE TO POLISHING WHEELS, BELTS, OR THE LIKE
Joseph S. Porter, New Haven, Conn., assignor to D. & H. Scovil, Incorporated, Higganum, Conn., a corporation of Connecticut
Application March 17, 1937, Serial No. 131,461
20 Claims. (Cl. 91—18)

1. Apparatus for applying abrasive to a polishing element comprising a suitably supported upwardly opening container for the abrasive, means for rotating said container, and means for supporting a polishing element above the con-

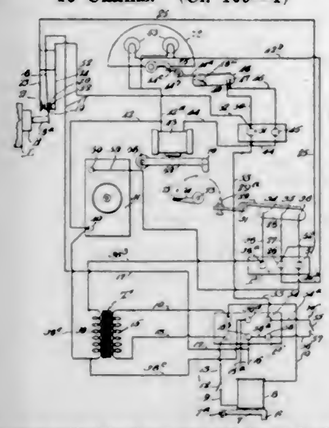
tainer with its surface in contact with the abrasive in the container.

2,098,307
SINGLE SIDE BAND TRANSMISSION
Ellison S. Purington, Gloucester, Mass., assignor to John Hays Hammond, Jr.
Original application September 6, 1930, Serial No. 480,165. Divided and this application September 6, 1935, Serial No. 39,361
3 Claims. (Cl. 179—171)



1. In a signalling system, means for generating high frequency energy, said last named means including a frequency determining variable reactance device, means for varying the variable reactance in accordance with the signal energy desired to be transmitted to thereby vary the frequency of the generated high frequency energy and cause a flow of high frequency energy through the reactance which varies simultaneously both in frequency and in magnitude, a non-selective impedance element in series with the variable reactance and arranged so that the high frequency energy passing through the reactance also passes through the non-selective impedance element whereby there is developed a potential across the impedance, rectifying means connected across the last named element and arranged so as to produce a flow of direct current the intensity of which varies in accordance with the original signalling energy and also with the departure of the frequency of the generated high frequency energy from a predetermined normal frequency value, means for filtering the output from the rectifier, a corrective network connected across the filtering means, said corrective network acting to make the voltage of the signal current relative to the impressed signal voltage vary with the signal frequency in a predetermined manner and means for amplitude modulating the original frequency modulated high frequency energy in accordance with the output of the corrective network.

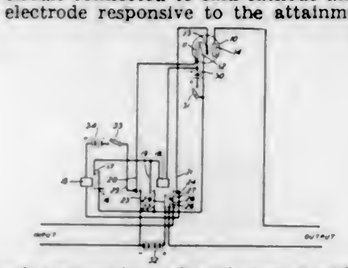
2,098,308
HOIST
Frank R. Ramsey, Portland, Oreg.
Application January 4, 1936, Serial No. 57,481
10 Claims. (Cl. 254—187)



1. A hoist comprising a frame, a driven shaft journaled thereon, a drum and disc rotatably arranged relatively upon said shaft, an external gear fixed to said shaft, an internal gear carried by said disc and a planetary gear journaled on

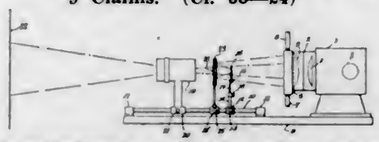
said drum upon an axis spaced laterally from that of the driven shaft, the said gears intermeshing and thus operatively engaging each other, said disc and drum elements provided with laterally projecting cylindrical braking surfaces arranged

in approximate abutment with each other overlying and housing said gear elements and means extending across the abutting edges of said braking surfaces and constituting a seal between said parts.



2,098,309
PROTECTIVE SYSTEM
Harry J. Robinson, Needham, and Ray F. Harrison, Stoughton, Mass., assignors to The Mosler Safe Company, Boston, Mass., a corporation of New York
Application July 21, 1934, Serial No. 736,298
10 Claims. (Cl. 109—1)

1. A protective system comprising a locker having a door, a manually actuable bolt for the door, a locking dog for the bolt, motor means for retracting the locking dog, a timing mechanism operative after a predetermined interval of time to make available energy for operating said motor means, a manually operable device operative to set said timing mechanism into operation, an outer protective enclosure for the locker, and means exterior to said protective enclosure operative to determine the application of energy for driving said motor means.

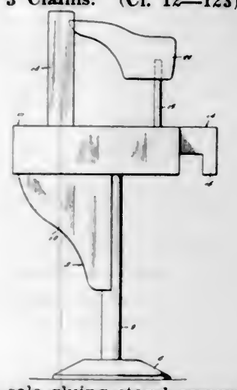


2,098,310
CIRCUIT FOR SPACE DISCHARGE DEVICES
George H. Rockwood, Jr., Orange, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application October 8, 1935, Serial No. 44,062
10 Claims. (Cl. 250—27)

1. In combination, a space discharge device comprising a cathode, an anode, and a third electrode, a heater circuit for said cathode, a normally open output circuit connected to said cathode and said anode, and means including an auxiliary circuit connected to said cathode and said third electrode responsive to the attainment of

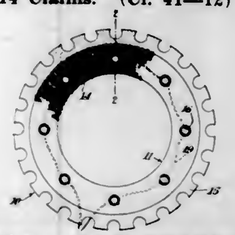
a cathode temperature after closing of said heater circuit sufficient to enable the passage of a desired space current to said anode, to close said output circuit, said auxiliary circuit including a source for applying a constant positive potential to said third electrode.

2,098,311
PROJECTING APPARATUS
Edwin C. Schattschneider, West Allis, Wis.
Application February 7, 1936, Serial No. 62,726
9 Claims. (Cl. 88—24)



1. A projecting apparatus comprising a screen, a projector, a source of light located on the other side of said projector from said screen, an object holder located between said projector and said source of light and adapted to hold an object, said object directly obstructing a portion of the beam of light from said source, whereby a silhouette of said object will be produced upon said screen, and a mirror located between said object holder and said projector for reflecting light from said source of light upon the front face of said object, said mirror having a cut away portion so that the silhouette of said object will not be obstructed by the mirror, said projector superimposing an image of said object upon the silhouette.

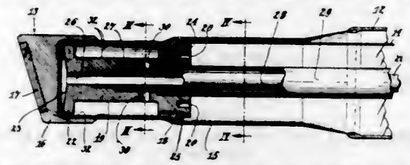
2,098,312
FOOT PAD
William M. Scholl, Chicago, Ill.
Application November 11, 1935, Serial No. 49,168
2 Claims. (Cl. 128—153)



1. A pad for application to the human body comprising a thin, perforated base ply having one surface coated for adhesive attachment to the body skin, a fibrous, cushion element united to the opposite surface and lying within the marginal edge of the base ply and having a perforation registering with the perforation of the base ply to form the shielding recess of the pad, and a thin, imperforate, water-proof, cover ply overlying the recess and extending beyond the marginal edge of the element, the extending portions of the plies being adhered together to seal the element against moisture penetration when the pad is in position on the skin.

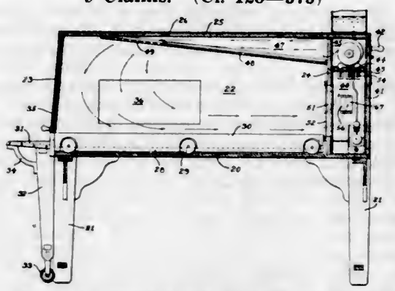
2,098,313
SHOE GLUING STAND
John Frank Sottile, Kingston, N. Y.
Application April 20, 1937, Serial No. 138,044
3 Claims. (Cl. 12—123)

1. A shoe sole gluing stand comprising a base having a column rising therefrom, a block on the upper part of said column and formed with a longitudinal groove, a slide mounted in said groove and having a standard rising therefrom, said slide being formed with a slot, an inverted shoe last having a rod depending therefrom and through said slot, and means removably mounting said rod on said block with the toe portion of the last overlying the top of said standard.



2,098,314
ORNAMENTAL WREATH
Israel H. Shalomith, Brooklyn, N. Y.
Application April 28, 1936, Serial No. 76,719
14 Claims. (Cl. 41—12)

9. In an electrically illuminated ornamental wreath, a core having an annular back member and an annular arched front member, one or more cut out openings in the said arched member each adapted to retain an electric lamp socket, a diagonal slit leading from each of the said openings to a peripheral edge of the said arched member, a wrapping of ornamental material surrounding the said core and keeping its members in position, and an annular crown member fitting closely and positioned over the outer edge of the wreath, surmounting the ornamental material.

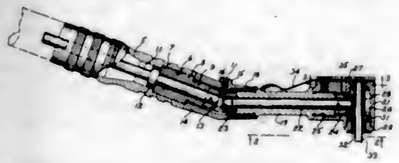


2,098,315
X-RAY TUBE
David Gordon Sharp, Bloomfield, N. J., assignor, by mesne assignments, to Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa., a corporation of Pennsylvania
Application July 14, 1934, Serial No. 735,181
6 Claims. (Cl. 250—35)

1. An X-ray tube comprising an envelope, a cathode, an anode including a refractory metal target which becomes heated during operation by electron bombardment, a back plate of good heat conducting material for supporting said target and a hollow anode stem for supporting said back plate, and means for uniformly circulating a cooling and insulating material over the maximum surface area of said back plate rearwardly of said target including a member disposed interiorly of said anode stem having passages for the ingress and egress of a cooling and

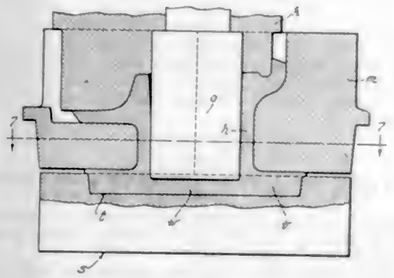
insulating material, and said member being of such size relative to said back plate and having a concave surface spaced a short distance from the adjacent rear surface of said back plate so as to impart a high turbulence and high velocity to said cooling and insulating material at all points of greatest heat to enable said material to flow over the surface of said back plate without filming and to effect maximum heat transfer from said anode to said cooling and insulating material.

2,098,316
METHOD OF AND APPARATUS FOR CREATING AN ARTIFICIAL FEVER
Edwin C. Sittler, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application July 22, 1933, Serial No. 681,750
9 Claims. (Cl. 128—373)



1. A body temperature controlling apparatus comprising walls forming a cabinet having a main compartment for receiving the body portion of a human body with the head extending without the main compartment at one end thereof and with the feet at the other end thereof, means for creating an artificial fever in the human body including means for heating and humidifying air, duct means for conducting air between the foot end of the main compartment and the head end of the main compartment, and forced draft means for circulating air through said duct means.

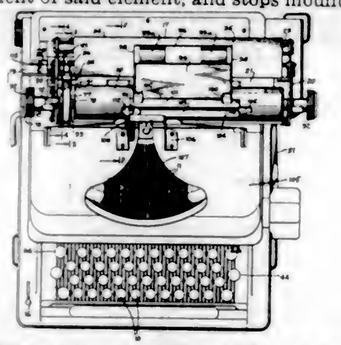
2,098,317
DENTAL APPLIANCE
Martin Staunt, Chicago, Ill.
Application September 19, 1935, Serial No. 41,219
3 Claims. (Cl. 32—27)



1. A dental apparatus comprising a head having a tubular shaft for receiving the stem of a tool, a removable bearing for one end of said

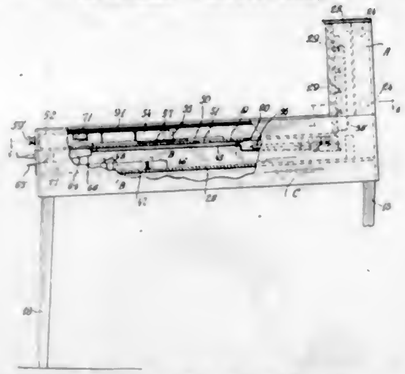
shaft, said bearing having a countersunk end, and a cap having a pressure fit in said counter-

sunk end for covering the end of said tubular shaft.



2,098,318
METHOD OF MAKING A FLANGED VALVE HOUSING
James Hall Taylor, Oak Park, Ill.
Application October 2, 1935, Serial No. 43,193
4 Claims. (Cl. 29—157.1)

1. The method of producing a valve housing, which comprises forging a cup-shaped blank comprising a tubular hub provided at its upper end with an integral continuous valve seat, a housing body element extending upward beyond said seat, and a metal mass depending from the lower end of said hub, smashing down said metal mass while confining said hub against radial distortion and thereby forming an integral bolting flange extending circumferentially of the lower end of the hub and a disc closing the lower end of said hub, removing said disc and thereby completing one housing section, and disposing two housing sections so produced in endwise alignment and welding them together on approximately the transverse median plane of the resulting housing with said flanges at the ends of the housing.

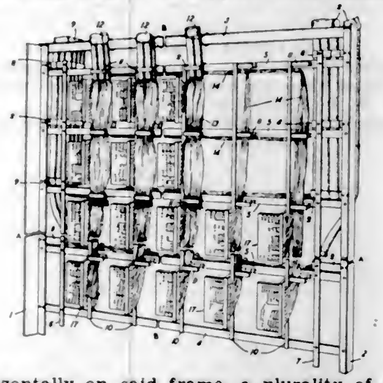


2,098,319
TYPEWRITING MACHINE
Russell G. Thompson, Rochester, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application May 25, 1934, Serial No. 727,382
11 Claims. (Cl. 197—127)

1. In combination with a platen, a platen driving element comprising a rotatable tape drum, a tape wound thereon; a driving element mounted on the tape drum and effective to drive the platen when the tape drum is rotated by pulling the tape wound thereon in a direction to unwind the tape, said element being ineffective when the tape drum is reversely rotated; a spring secured to the tape drum for reversely rotating the drum to rewind the tape when pull on the latter is relaxed, a pair of holding pawls for normally preventing rotation of the platen and releasable by initial movement of said element, and stops mounted on

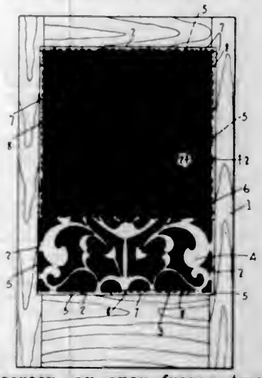
the platen and co-operating with said holding pawls to limit rotation of the platen.

2,098,320
GAME APPARATUS
Harry G. Traver, Beaver Falls, Pa., assignor to International Mutoscope Reel Co., Inc., New York, N. Y., a corporation of New York
Application July 5, 1934, Serial No. 733,779
11 Claims. (Cl. 273—122)



1. In a game apparatus, a board having openings at one end into one of which openings a ball projected from the opposite end of the board is adapted to enter, means to receive a ball entered into and passing through an opening in the board and operative to return the ball to the board, means to releasably hold said ball return means against movement after a predetermined number of balls have been received thereby, and coin controlled means to release the holding means from said ball return means.

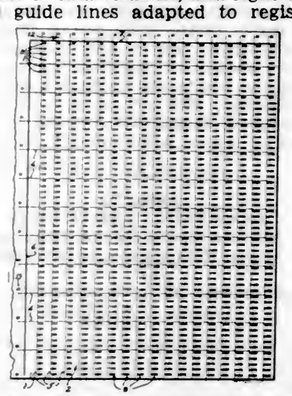
2,098,321
DISTRIBUTING FRAME
Frederick W. Treptow, Rutherford, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application June 7, 1935, Serial No. 25,397
10 Claims. (Cl. 179—98)



1. In a trunk distribution system a distributing frame, a pair of vertical supports, a plurality of horizontal members extending between said supports, a plurality of C-shaped wire supporting brackets attached to the front and rear of said members, the brackets on the front of said

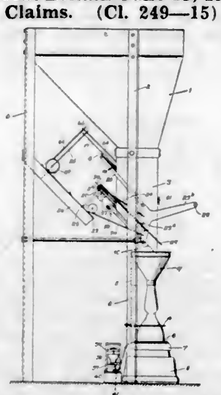
members being aligned in vertical rows to support wires extending vertically on said frame and the brackets on the rear of each of said members being aligned to support wires extending

horizontally on said frame, a plurality of vertical members attached to said horizontal members and a plurality of terminal strips secured to each of said vertical members.



2,098,322
SCREEN
Jerome M. Trotcky, Albany, N. Y.
Substituted for abandoned application Serial No. 686,011, August 21, 1933. This application May 25, 1936, Serial No. 81,552
4 Claims. (Cl. 156—14)

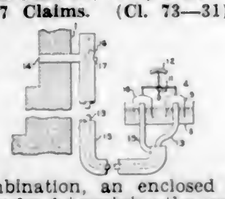
1. In a screen, an open frame, two layers of screen cloth stretched thereacross, an open-work stiffening member between the cloth layers, and means to secure the layers of screen cloth and stiffening member to the frame.



2,098,323
GAUGE FOR COUNTING TYPEWRITTEN CHARACTERS
Harry L. Wadsworth, Los Angeles, Calif.
Application May 27, 1935, Serial No. 23,728
2 Claims. (Cl. 33—1)

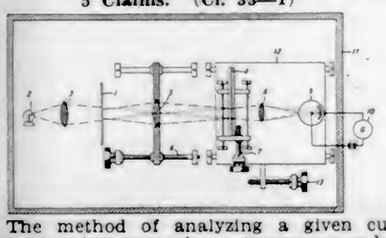
1. A gauge for counting typewritten characters comprising: a sheet of transparent material having tabularly arranged totals thereon in horizontal rows spaced to correspond to a predetermined number of characters in a line and in vertical columns spaced to correspond to the line spacing of a selected style of type and adapted to be superposed on a sheet of manuscript so that the printed totals on the gauge will indicate the total numbers of characters on the manuscript at points registering with said printed totals, horizontal rulings at regular intervals subdividing said rows into groups, and vertical rulings adjacent the left hand digits of said columns, and right angularly extended guide lines adapted to register with

characters on the manuscript to position the sheet for use, one of said guide lines being spaced to the left of the adjacent vertical column and adapted by reason of the transparency of the sheet to be placed between the first and second characters on each line of manuscript over which the sheet is placed and the other guide line being disposed to be placed below the first line of characters of said manuscript.



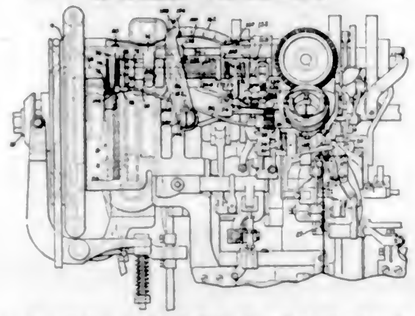
2,098,324
APPARATUS FOR DELIVERING AND WEIGHING PREDETERMINED QUANTITIES OF MATERIAL
Thomas Ottiwell Ward, Roby, and Stanley Eaton, Mossley Hill, Liverpool, England
Application June 10, 1936, Serial No. 84,538
In Great Britain June 15, 1935
2 Claims. (Cl. 249—15)

1. Apparatus for automatically delivering and weighing predetermined quantities of granular and like material, of the type referred to, comprising a slidably disposed plate shutter valve for controlling the supply of material from the hopper to the measuring chamber of said apparatus and a similar valve for controlling the supply of material from said measuring chamber to the weighing device, said valves being adapted to be



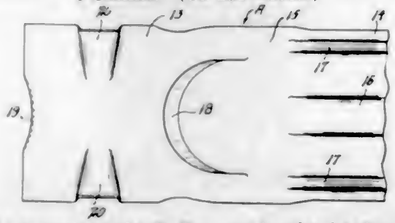
so reciprocated in unison with each other that when the discharge orifice of the hopper is open the discharge orifice of the measuring chamber is closed and vice versa, said hopper plate shutter valve having a relatively small aperture formed therein for permitting after said hopper valve has been closed a continuous dribble of the material from the hopper through the measuring chamber direct to the scale pan, a closure member disposed within said dribble aperture for controlling the area of said dribble aperture, an external handle connected to and operating said closure member, and means to compensate for the material in flight between the hopper and the weighing device after cut-off of the supply.

2,098,325
MEASURING APPARATUS
Harry E. Weaver, South Euclid, Ohio, assignor to Bailey Meter Company, a corporation of Delaware
Application June 29, 1934, Serial No. 733,065
7 Claims. (Cl. 73—31)



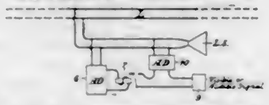
1. In combination, an enclosed structure, a pressure gage for determining the pressure within said structure, a connection between said gage and the interior of said structure, and a connection between said gage and the atmosphere at the exterior of said structure, one of said connections surrounding the other throughout substantially its entire length, said gage sensitive to the difference in the pressures within said connections.

2,098,326
CALCULATING DEVICE
Edward C. Wente, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application April 10, 1935, Serial No. 15,727
5 Claims. (Cl. 33—1)



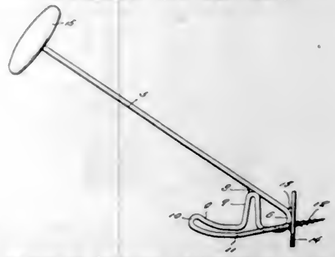
1. The method of analyzing a given curve which comprises preparing a transparency having a coefficient of transmission varying laterally in accordance with the variations in one period of the curve, preparing a second transparency having a vertically constant coefficient of transmission varying laterally in accordance with a sinusoidal function having a period which is an integral part of the period of the curve, optically aligning both said transparencies in a uniform beam of radiant energy, detecting the total radiant energy transmitted through both transparencies, shifting said second transparency until the total radiant energy transmitted is a maximum, measuring said maximum, again shifting said second transparency until the total radiant energy transmitted is a minimum, measuring said minimum, and determining the magnitude of a harmonic of said curve from said readings.

2,098,327
LOCKSTITCH SEWING MACHINE
Erastus E. Winkley, Lynn, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application November 19, 1935, Serial No. 50,532
18 Claims. (Cl. 112—186)



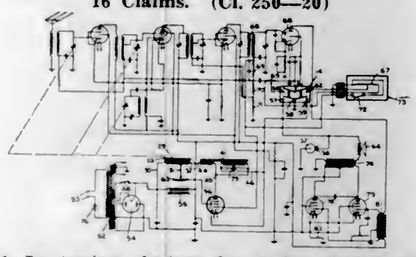
1. A lockstitch shoe sewing machine having, in combination, a needle, a locking thread case, a loop taker for passing a loop of needle thread about the thread case during each sewing cycle of the machine, and means engaging the thread outside the thread case for feeding thread lengthwise into the thread case to replenish the supply therein.

2,098,328
SPRING PLANK
Ralph B. Winship, Montreal, Quebec, Canada
Application September 14, 1933, Serial No. 689,406
6 Claims. (Cl. 105—208.2)



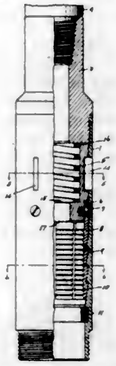
1. A spring plank for car trucks having an elongated central rigid portion, end portions adapted to rest on side frames, and flat portions joining the central portion to the end portions, said flat portions being resilient.

2,098,329
MAINTENANCE OF PROGRAM TRANSMISSION CIRCUITS
Herman Andrew Affel, Ridgewood, N. J., assignor to American Telephone and Telegraph Company, a corporation of New York
Application September 24, 1935, Serial No. 41,920
13 Claims. (Cl. 179—1.1)



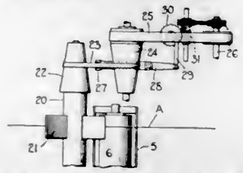
1. In a program transmission line, means for monitoring the line comprising a signal responsive device bridged across the line and responsive to line signals, a secondary circuit, and an electrically operated relay so controlled by said responsive device as to cause said secondary signal circuit to be operated during periods of program silence on the transmission line.

2,098,330
COAT AND HAT HOOK
Herbert E. Binder, Milwaukee, Wis.
Application December 28, 1936, Serial No. 117,941
2 Claims. (Cl. 248—217)



1. A garment hanger comprising a length of wire rod bent, shaped and dimensioned to provide a hat suspension arm provided at one end with a return bend merging into a U-shaped brace member secured at its closed end to said arm, and having one side at the open end of the U extended forwardly and longitudinally bowed to present a garment suspension hook, said garment suspension hook at its free end merging into a return bend, with the free end of the wire extending rearwardly from said return bend and extending beyond the first mentioned return bend with its terminal being tapered and threaded to provide an attaching screw whereby the hanger may be secured to a wall or analogous support.

2,098,331
AUTOMATIC STATION SELECTOR FOR RADIO RECEIVERS
William John Bowman, Kitchener, Ontario, Canada
Application April 21, 1934, Serial No. 721,693
16 Claims. (Cl. 250—20)



1. In tuning devices for radio circuits, the combination with power actuated frequency changing means for the radio circuit for scanning the spectrum through which the circuit is adapted to tune, of continuously operative power controlling means for the frequency changing means actuated by an incoming signal including means for causing the power controlling means to exert a controlling effect as resonance with the incoming signal is approached such that the magnitude of the controlling effect is a function of the amplitude of the signal resonance curve and its rate of application is a function of the steepness of such curve.

2,098,332
OVERSHOT
Walter L. Church, Houston, Tex.
Application January 31, 1935, Serial No. 4,262
2 Claims. (Cl. 294—102)

1. An overshot comprising a shell like housing, an operating string whose end is screwed into the housing forming a downwardly facing abutment, a tubular slip support in the housing having external J slots and whose lower end is inwardly thickened forming an upwardly facing shoulder, keys secured to the shell and working in said J slots, independent slips depending from the support, radial pins securing the upper ends of the slips to the support, said housing and slips having coacting faces shaped to effect the contraction of the slips upon downward movement of the support in the housing, and a coil spring between the abutment and shoulder and housed within the support and effective to accelerate such downward movement and to maintain the slips contracted.

2,098,333
TREATMENT OF TEXTILE MATERIAL
Camille Dreyfus, New York, N. Y., and William Whitehead, Cumberland, Md., assignors to Celanese Corporation of America, a corporation of Delaware
Original application October 28, 1931, Serial No. 571,582. Divided and this application April 25, 1935, Serial No. 18,158
5 Claims. (Cl. 8—19)

1. In apparatus for applying a liquid to yarn while it is in transit, the combination of a source of supply for the yarn, means for winding up said yarn, a source of supply for the liquid to be applied and means including a variable drive for causing the yarn to contact with the source of supply of liquid at continuously varying intervals.

2,098,334
MANUFACTURE OF ALIPHATIC ANHYDRIDES
Henry Dreyfus, London, England
No Drawing. Application April 16, 1935, Serial No. 16,622. In Great Britain April 19, 1934
14 Claims. (Cl. 260—123)

1. Process for the manufacture of an aliphatic

anhydride which comprises subjecting the corresponding aliphatic acid to thermal decomposition in presence of metaphosphoric acid produced by the thermal decomposition of a phosphate of a volatilizable base.

2,098,335

MANUFACTURE OF DERIVATIVES OF POLYHYDROXY COMPOUNDS

Henry Dreyfus, London, England

No Drawing. Application June 3, 1936, Serial No. 83,269. In Great Britain June 22, 1935
5 Claims. (Cl. 260—152)

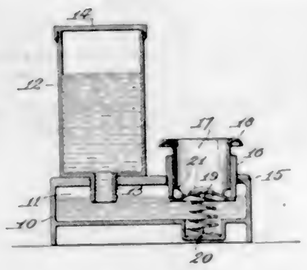
1. Process for the production of cellulose ethers, which comprises reacting on fibrous cellulosic materials with etherifying agents under substantially anhydrous conditions in the presence of aliphatic organic bases.

2,098,336

MANUFACTURE OF CELLULOSE DERIVATIVES AND PRODUCTS OBTAINED THEREFROM

Henry Dreyfus, London, England

No Drawing. Application June 3, 1936, Serial No. 83,271. In Great Britain June 22, 1935
7 Claims. (Cl. 260—101)



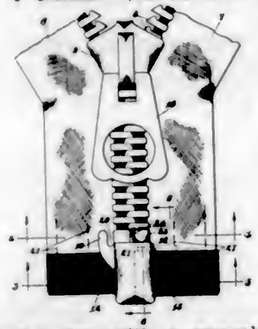
1. Process for the production of ether-esters of cellulose, comprising esterifying partial ethers of cellulose which have been produced under substantially anhydrous conditions and in the presence of an organic base.

2,098,337

CIGARETTE EXTINGUISHER

Harry D. Edwards, Los Angeles, Calif.

Application April 1, 1936, Serial No. 72,071
3 Claims. (Cl. 131—51)



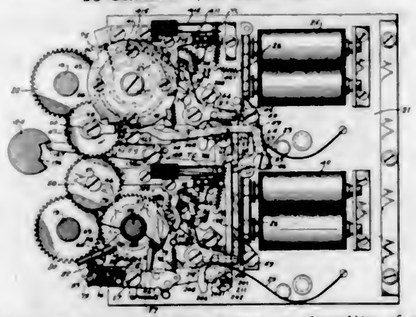
3. In a cigarette extinguisher, a base provided with a chamber adapted to contain water, an open-ended tubular member mounted on the upper portion of said base and extending downwardly into the water chamber therein, a tubular member arranged for sliding movement through said open ended tubular member, a disc carried by the lower end of said second mentioned tubular member and adapted to engage the lower end of said open ended tubular member, a spring arranged beneath said disc for yieldingly resisting the downward movement of said disc and said second mentioned tubular member, there being openings formed through the wall of the second mentioned tubular member immediately above said disc and a reservoir mounted on said base and having communication with the water chamber therein.

2,098,338

SEPARABLE FASTENER

William L. Gilmore, Meadville, Pa., assignor to Hookless Fastener Company, a corporation of Pennsylvania

Application January 28, 1933, Serial No. 654,030
6 Claims. (Cl. 24—205)



1. In combination with a separable fastener of the kind having a pair of stringers provided with cooperating series of fastener elements and a slider for engaging and disengaging said fastener elements, a separable end connection comprising cooperating independent connecting members attached respectively to said stringers and metallic reinforcing means on the end of at least one of said stringers interlocked with the connecting member, said reinforcing means overlying a portion of the stringer and having openings to permit uninterrupted passage of stitches therethrough at any desired point.

2,098,339

ACCOUNTING MACHINE

Alvin E. Gray, Flushing, N. Y., assignor, by mesne assignments, to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application June 18, 1931, Serial No. 545,256
15 Claims. (Cl. 235—61.8)

1. In an accumulating device, a plurality of accumulating elements, means for actuating said elements, means for engaging said elements with the actuating means, and means under control of one element of the device for changing the instant at which said engaging means operates to engage the next higher order element with the actuating means.

2,098,340

ORAL AIRWAY DAM

Joseph P. Henahan, Cleveland, Ohio

Application December 7, 1936, Serial No. 114,698
3 Claims. (Cl. 128—132)

2. A mouth dam of the character described comprising a body of resilient material and of a shape conforming with the construction of the dorsum portion of the mouth, said body being provided

with a vertically disposed tube at the rear side thereof, terminating at its upper end in the form of a funnel.

2,098,341

FLASHLIGHT POWDER

Albert Kälber, Pforzheim, Germany

Application March 2, 1936, Serial No. 66,751
3 Claims. (Cl. 52—24)

1. A flashlight powder mixture consisting of:

	Parts by weight
Magnesium (Mg)	120 to 140
Aluminium (Al)	25 to 32
Finely ground calcareous alabaster ($CaCO_3$)	45 to 56
Silica (SiO_2)	18 to 24
Repeatedly glowed magnesia usta (MgO)	8 to 12

2,098,342

HOIST BRAKE

Max T. Knutzen, Toronto, Ontario, Canada, assignor to Nordberg Manufacturing Company, Milwaukee, Wis., a corporation of Wisconsin

Application May 11, 1936, Serial No. 79,142
20 Claims. (Cl. 192—17)

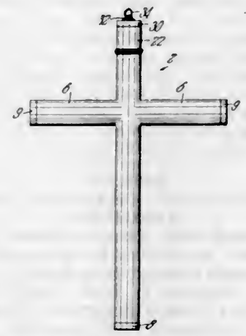
1. The combination of a power-driven shaft; a winding drum rotatably mounted relatively to said shaft; clutch means interposed between said shaft and drum and having an engaged position and a released position; a power-controlled brake for said drum including means biasing the brake in an applying direction and a motor which when energized overpowers said biasing means; a manually actuated controller for said brake motor; and means associated with said clutch means and rendered effective as an incident to disengagement thereof to interrupt the supply of energy by said controller to said motor and deenergize said motor.

2,098,343

SKELETON POLE

Lon Lawton, Stevenson, Wash.

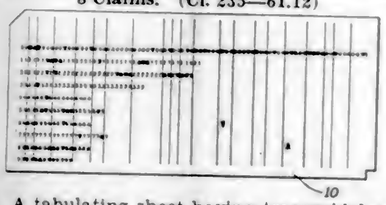
Application November 18, 1936, Serial No. 111,433
3 Claims. (Cl. 189—24)



1. A skeleton metal pole including a base plate, a resilient metal spiral attached to said base plate, said spiral extending approximately the full length of said pole, a plurality of longitudinal struts attached to said base plate about said spiral, said struts extending the full length of said pole, a series of encircling rings placed on said struts so as to cause said struts to compress said spiral, said rings secured in place on said struts at equal intervals.

2,098,344

DISPENSER



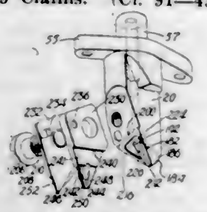
Frank Le Boeuf, Hartford, Conn.

Application June 23, 1937, Serial No. 149,963
1 Claim. (Cl. 221—1)

As a new article of manufacture, a dispensing device of the class described comprising in combination, a vertical hollow tube, horizontally-disposed and aligned side arms secured to opposite sides thereof to form a cross, a closure cap on the lower end of said tube, the latter having an open upper end and being adapted to hold liquid, an internally-threaded sleeve within the upper end part of said tube, a nozzle member having a lower part in threaded engagement with said sleeve and an upper part projecting above the upper edge thereof, and a closure cap for fitting over said nozzle.

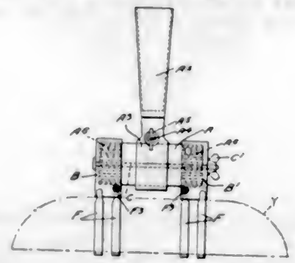
2,098,345
CONTROL CARD
Lawrence E. Lentz, New York, N. Y., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware
Application December 30, 1933, Serial No. 704,796
8 Claims. (Cl. 235—61.12)

1. A tabulating sheet having trapezoidal apertures arranged in vertical columns and horizontal rows and each having two opposite non-parallel sides, the apertures in adjacent columns being inverted.



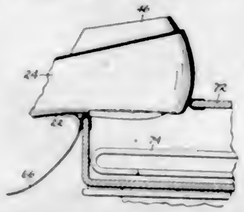
7. A control device of sheet material having locations for perforations in vertical columns and horizontal rows and having vertically tapering perforations formed at certain of said locations and relatively inverted in adjacent columns.

2,098,346
SHOE HEEL CONSTRUCTION
Robert D. MacDonald, Grosse Pointe Park, Mich.
Application February 12, 1936, Serial No. 63,484
2 Claims. (Cl. 36—36)



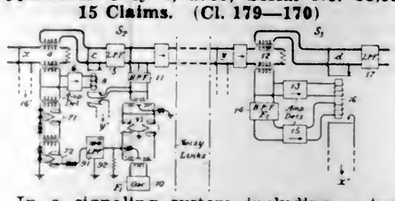
1. A shoe construction including, in combination, a relatively rigid heel member permanently secured to the shoe with which it is associated, said heel member having a channel of dovetail cross section formed in the bottom face thereof, said channel being of substantially uniform width and being substantially uniformly spaced from the marginal edge of the bottom face of said heel member, and a resilient heel member having a configuration substantially congruent to said permanent heel member, said resilient heel member having an endless ridge of dovetail cross section in the upper surface thereof adapted to seat within the channel formed in said permanent heel member to retain said resilient heel member in position with respect thereto with the lateral edges of said permanent and resilient heel members lying flush with each other.

2,098,347
NOZZLE FOR SHOE CHANNEL CEMENTING MACHINES
Wilbur L. MacKenzie, Beverly, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application October 1, 1935, Serial No. 43,064
In Great Britain September 25, 1935
25 Claims. (Cl. 91—43)



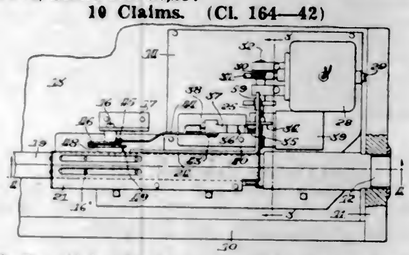
6. In a channel cementing machine, a nozzle having an end face, an outlet passage terminating in said end face, a cover member spaced from the nozzle and provided with a flat inner surface, and an apertured intermediate deflector the work-engaging end of which is provided with shoulders upon each surface, thereby together with faces of said nozzle and said cover to define two sets of lateral passages through which cement may be delivered to the channel flap and the channel bed.

2,098,348
HANDLE ADJUSTMENT FOR BROOMS AND SIMILAR IMPLEMENTS
Charles Frederick Mason and Hugh Charles Lewis Mason, Caversham, Reading, England
Application August 29, 1936, Serial No. 98,614
In Great Britain August 29, 1935
4 Claims. (Cl. 306—17)



1. In an adjustable handle for brooms and like implements provided with a head, the combination of a horizontal supporting rod having external parallel serrations on the outer surface thereof, supporting brackets for the ends of the rod having internal serrations within the same, means for connecting the brackets to the head of the implement, a handle and receiving socket, and a clamp on the said socket adjustably mounted on the said horizontal rod.

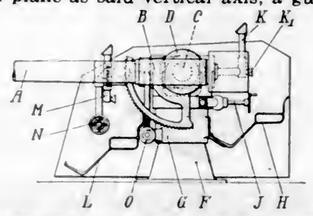
2,098,349
PROCESS OF ATTACHING HEELS TO SHOES
Ralph S. Megathlin, Wollaston, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application October 31, 1935, Serial No. 47,622
3 Claims. (Cl. 12—147)



1. The method of attaching heels to shoes which comprises heating the heel seat of a shoe in order to render the same readily moldable, heating a heel which is to form a part of the shoe, applying a mass of thermoplastic adhesive to the attaching face of the heel, forcing the attaching face of the heel under heavy molding pressure against the heel seat of the shoe, and maintaining the molding pressure of the heel against the shoe in order to retain the heel seat in molded conformation until the thermoplastic adhesive has set.

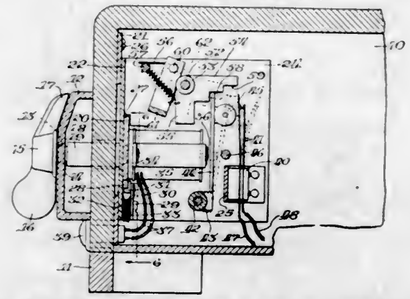
2,098,350
CONTROL OF SIGNALING CIRCUITS
Doren Mitchell, Bound Brook, N. J., assignor to American Telephone and Telegraph Company, a corporation of New York
Application July 2, 1936, Serial No. 88,636
15 Claims. (Cl. 179—170)

1. In a signaling system including a transmitting section, a receiving section and an intermediate link, means associated with the transmitting section and responsive to signal energy therein for applying distinctive control energy to the system, and means for varying the magnitude of the applied control energy inversely with variation of the magnitude of said signal energy.



2,098,351
TICKET SEVERING MEANS
Raymond T. Moloney, Chicago, Ill.
Original application April 2, 1935, Serial No. 14,314, now Patent No. 2,046,084, dated June 30, 1936. Divided and this application May 28, 1936, Serial No. 82,237
10 Claims. (Cl. 164—42)

1. In a ticket issuer, an electric motor operable when energized, a shaft driven by the motor, a cam wheel carried on and driven by the shaft, a reciprocable member operable by means driven from said shaft, a pin wheel driven from the reciprocable member for engaging a perforated band of tickets to advance the same across a guide surface to a point of discharge, a knife blade fulcrumed adjacent one end for pivotal movement and held in inoperative position adjacent the band, means engaging the knife blade to hold the knife in such position, said last mentioned means including a member engaging and controlled by the cam wheel to cause release of the knife blade for movement to operative position to sever a ticket from the band, and a spring operatively associated with the knife blade and engaging same to press it to severing position when released.



2,098,352
GUNS HAVING MEANS FOR HORIZON- ADJUSTMENT
Eduard Müller, Dusseldorf, Germany, assignor to Rheinmetall-Borsig Aktiengesellschaft, Dusseldorf, Germany
Application March 3, 1936, Serial No. 66,947
In Germany August 29, 1930
6 Claims. (Cl. 89—37)

1. A gun mounting for use on unsteady platforms, ships, and the like comprising an undercarriage capable of turning about a vertical axis for training adjustment, a saddle capable of horizontalizing turning movement in said undercarriage about a horizontal axis lying in the same vertical plane as said vertical axis, a gun cradle

capable of elevational adjustment in said saddle, and sighting means including an eye-piece arranged on said horizontalizing saddle with the eye-piece substantially coaxial with the horizontalizing axis.

2,098,353
SELECTOR
Frank G. Nicolaus and Charles J. Breitenstein, Chicago, Ill., assignors to Raymond T. Moloney, Chicago, Ill.
Application November 21, 1936, Serial No. 112,108
13 Claims. (Cl. 200—98)

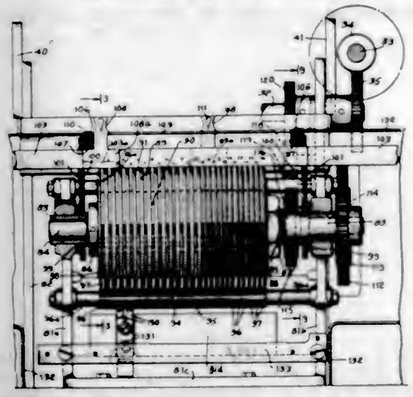
1. A circuit selector adapted to be carried in a wall member, said selector comprising a bracket, a plate carried in the bracket for endwise movement, a handle element for moving said plate, a plurality of normally open switches carried adjacent the bracket, a cross shaft carried by the bracket between the plate and switches, a plurality of levers individually carried by said shaft for pivotal movement and each lever including switch engaging means to close an adjacent switch, an electromagnetic device carried by the plate and movable thereby to a position adjacent a lever without operating same, whereby when the electromagnetic device is subsequently energized a lever is moved to engage and close a selected switch.

2,098,354
METHOD OF MAKING FOOTWEAR
Frederick F. Olson, Belmont, Mass., assignor to Hood Rubber Company, Inc., Watertown, Mass., a corporation of Delaware
Application November 20, 1934, Serial No. 753,885
4 Claims. (Cl. 12—142)

1. The method of making a high-heeled article of footwear which comprises providing a form of less width than that of a last of usual shape for the size of footwear being made and corresponding substantially in perimeter upon any plane of cross-section to the perimeter at a corresponding plane of cross-section of the last, and formed with

a high heel portion of a shape substantially corresponding to the final shape of the heel portion of the footwear, fitting a rubberized upper material upon the form and extending across the bot-

tom thereof and around the heel portion, removing the fitted article from the form and mounting it upon a last of the aforementioned shape, and completing the article of footwear.



2,098,355

RECORD CONTROLLED MACHINE

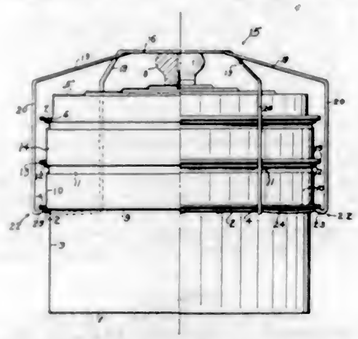
Ralph E. Page, Binghamton, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application October 4, 1935, Serial No. 43,493

13 Claims. (Cl. 209—110)

1. A selecting commutator for record controlled machines comprising a series of rotatable contact devices; a series of slides manually movable transversely of the plane of rotation of the contact devices, said slides being arranged in an arc and wiped by the contact devices during their rotation; and means on the slides and movable therewith for preventing electrical contact with a predetermined number of the contact devices.

2,098,356



COMBINATION FOOD CONTAINER

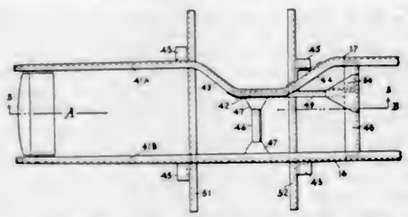
Frederick F. Pfefferkorn and Carl A. Stevens, Carrollton, Ohio, assignors to The Carrollton Metal Products Company, a corporation of Ohio

Original application April 4, 1934, Serial No. 719,058. Divided and this application July 15, 1935, Serial No. 31,352

5 Claims. (Cl. 220—1)

1. In combination, a plurality of containers each having an outwardly flaring margin affording a laterally offset portion surrounded by an adjoining upstanding portion, said offset portion and upstanding portion constituting a shallow socket, said containers being adapted to be nested together with upper containers resting on the laterally offset portions and fitting within the upstanding portions of next lower sockets, a cover adapted to rest on the laterally offset portion and to fit within the upstanding portion of the uppermost container, a knob fastened to the top of the cover, a one-piece wire clip having inturned portions and an intermediate portion joining the inturned portions, said clip being engageable with the cover and the lowermost container, with the intermediate portion

extending over the cover and engaging the knob and with the inturned portions engaging the underside of the outwardly flaring margin of the lowermost container, the clip being out of substantially forceable engagement with any intermediate container, the clip being in sprung condition to maintain the ensemble tightly together, the clip being detachable by springing the inturned portions free from the outwardly flaring margin.



2,098,357

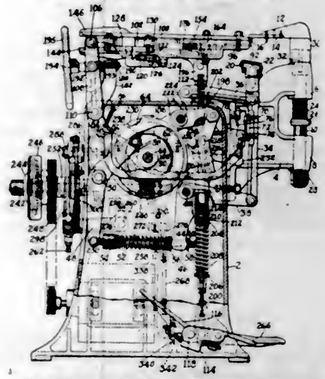
DELIVERY VEHICLE CHASSIS

George S. Piroumoff, New York, N. Y.

Application October 10, 1936, Serial No. 105,037

4 Claims. (Cl. 280—106)

1. In a motor driven vehicle provided with a demountable body equipped with a depending pit platform extending inwardly from a body side one step beneath the body floor level, the combination of a chassis comprising front and rear wheel axles suspending thereacross a pair of longitudinally continuous frame channels that respectively lie in spaced relation within the confines of their contiguous body sides, one such channel in the forward half of the wheel base being medially offset and laterally deflected toward its mate on a level lying above the wheel centers to accommodate the aforesaid platform, and means cross-bracing said frame channels, said means including bracket means depending from each such channel and an interconnected transverse beam extending crosswise beneath said channels and outwardly beyond said one channel to reenforcingly uphold said platform.



2,098,358

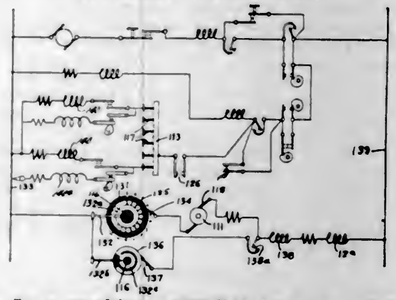
LASTING MACHINE

Arthur F. Pym, Swampscott, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey

Application July 3, 1936, Serial No. 88,819

23 Claims. (Cl. 12—14)

1. In a lasting machine, wipers for wiping the margin of an upper inwardly over the bottom of a last around an end of the last, means movable by the operator thus to operate the wipers, and power-operated means comprising a cam-operated member for thereafter effecting relative movement of the wipers and the last heightwise of the last to cause the wipers to apply compacting pressure to the overwiped margin of the upper.



2,098,359

TABULATING MACHINE

Lynus Clyde Reynolds, Sweetwater, Tenn., assignor, by mesne assignments, to International Business Machines Corporation, New York, N. Y., a corporation of New York

Application December 5, 1930, Serial No. 500,234

10 Claims. (Cl. 235—61.7)

1. In a machine controlled by a record tape comprising spaced record fields each containing item designations and item classification designations, the combination of analyzing means for the item designations in the record fields, a second analyzing means for the classification designations adapted to sense the classification designations of each field a predetermined number of machine cycles prior to analysis of the same record field by the first analyzing means, means for feeding the tape to both analyzing means, means for rendering said second named analyzing means effective to sense only predetermined classification designations, accumulating mechanism controlled by the first named analyzing means, a device for rendering the first named analyzing means ineffective to control said accumulating mechanism; a rotary timing member rotated in synchronism with the feeding of the tape, said member having a plurality of elements, each settable to control the operation of said device, said elements corresponding in number to the number of machine cycles required for analysis of any given record field by both analyzing means; and means controlled by the second named analyzing means for setting one of said elements on the occurrence of classification designations which the second named analyzing means is effective to sense.

2,098,360

TEXTILE APPARATUS

Reginald Henry John Riley, Ralph Ashton, and Harold Livesey, Spondon, near Derby, England, assignors to Celanese Corporation of America, a corporation of Delaware

Application August 20, 1935, Serial No. 36,942

In Great Britain September 3, 1934

7 Claims. (Cl. 118—62)

1. A cap spinning device provided with damping means said device comprising a non-rotary cap, a mass located in proximity to the head of said cap, and means for retaining said mass on said cap, said means permitting a limited movement of said mass with respect to the axis of said cap and resisting such movement.

2,098,361

RESIN PRODUCTION

Joseph Rivkin, Pittsburgh, Pa., assignor to The Neville Company, a corporation of Pennsylvania

No Drawing. Application December 21, 1935, Serial No. 55,613

4 Claims. (Cl. 260—7)

1. The herein described selective recovery steps as practiced upon a solvent naphtha containing in solution alcohol soluble resinous products of a mixed reaction involving the polymerizables occurring initially in the solvent naphtha and a phenol to produce a phenol-modified coumarone resin and containing traces of an unspent acid catalyst, which recovery method comprises removing a portion of the resinous reaction products having greater alcohol solubility from solution in the hydrocarbon liquid by agitating with the solvent naphtha a water solution of a strong base in a quantity and concentration in excess of that adequate to effect neutralization in the liquid with consequent stratification into an aqueous layer containing resin of greater alcohol solubility and a solvent naphtha layer containing resin of lesser solubility, separating the two layers of diverse character, and individually recovering the resinous content of each.

2,098,362

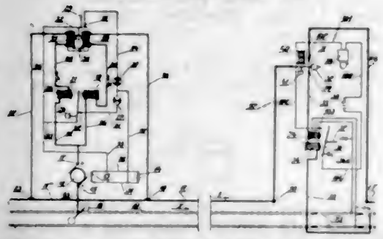
CELLULOSE ACETATE COMPOSITION

Joseph Rivkin, Pittsburgh, Pa., assignor to The Neville Company, a corporation of Pennsylvania

No Drawing. Application November 27, 1936, Serial No. 113,011

4 Claims. (Cl. 106—40)

1. A composition of matter comprising a solution of cellulose acetate in an oily, viscous, alcohol



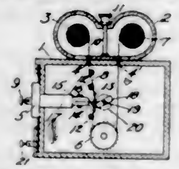
soluble fluid comprising the lower molecular weight, normally liquid products formed by polymerization and phenolic interreaction in a mixture of crude solvent naphtha and a phenolic reactive with production of an alcohol soluble resinous body containing distillation separable, alcohol soluble coumarone resin and said oily fluid.

2,098,363

RAILROAD SIGNALING DEVICE BASED UPON THE SPACING DUE TO THE SPEED

Raymond Arthur Tuot, Strasbourg, France, assignor to Société Auxiliaire d'Etudes Electrotechniques, Strasbourg, France

Application May 15, 1935, Serial No. 21,617
In France August 18, 1934
5 Claims. (Cl. 246—67)



1. A signaling system for trains on railroads, comprising an electric generator with constant field on a train, said generator being driven in dependence on train speed, a connection from one terminal of the generator to ground through the wheels of the train, a sectionalized pilot wire of high resistance extending parallel to the rails, a shoe on the train contacting said pilot wire, track apparatus between consecutive sections of the pilot wire and comprising a contact device normally grounding the end of the pilot wire section contacting said shoe and operable upon sufficient increase of current in said section to connect the latter to the next section, an indicator on said train, a connection from the second terminal of the train generator to said shoe, and current responsive means in said connection for operating the indicator.

2,098,364

METHOD OF AND MEANS FOR TRANSMITTING, RECORDING, AND REPRODUCING SOUND

Joseph Tykocinski-Tykociner, Urbana, Ill.

Application May 11, 1929, Serial No. 362,446
8 Claims. (Cl. 179—100.3)

1. In combination, a photo-sensitive film, a source of actinic effect comprising a minute gas film, an electrode defining said gas film, another electrode guiding the motion of the photosensitive film, both electrodes being maintained substantially in contact with said film, means for pressing said electrodes against the sensitive film and means for impressing sound controlled variations of potential upon said electrodes for varying the intensity of the discharge.

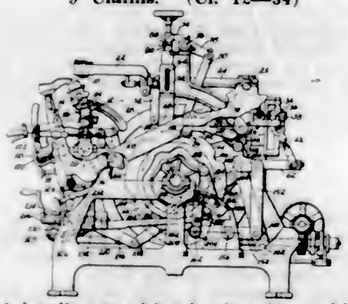
2,098,365

POROUS HALOGEN CONTAINING RUBBER DERIVATIVES

Herbert A. Winkelmann, Chicago, and William C. Calvert, Oak Park, Ill., assignors to Marbon Corporation, a corporation of Delaware

No Drawing. Application September 5, 1935, Serial No. 39,220
4 Claims. (Cl. 18—53)

1. As a new article of manufacture, a solid, porous, flexible mass comprising a vulcanized halogen containing rubber derivative and having uniformly distributed pores of such size and amount as those present in rubber sponges.



4. The method of making a porous, oil resistant, flexible mass which comprises heat treating a mixture of a rubber hydrochloride, a vulcanizing agent, and a blowing agent at a temperature and for a time sufficient to cure the halogen containing rubber derivative and decompose the expanding agent whereby a porous mass is produced.

2,098,366

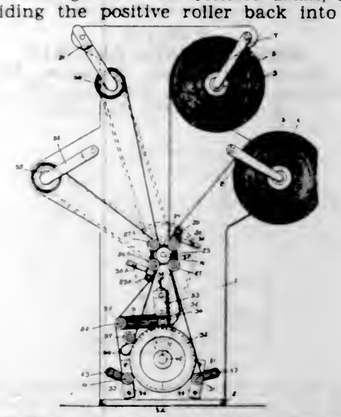
LEVELING MACHINE

Erastus E. Winkley, Lynn, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey

Application July 7, 1936, Serial No. 89,365
9 Claims. (Cl. 12—34)

1. A leveling machine having, in combination, a shoe support, a leveling roll, means for effecting relative movement of said shoe support and leveling roll in directions lengthwise of the shoe to cause the leveling roll to operate along the bottom of the shoe, means for pressing the roll upon the shoe and for relieving the pressure at predetermined times in the cycle of operations of the machine, and means for varying the rate of relative movement of the shoe support and leveling roll in operating upon both the forepart and shank to control their relative positions at each and every time in the cycle when the pressure of the roll is relieved in operating on shoes of different styles.

2,098,367



MOVING PICTURE FILM PRINTING MACHINE

Remsen V. Wood, Rochester, N. Y., assignor, by direct and mesne assignments, to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application June 8, 1931, Serial No. 542,867
Renewed September 28, 1934
2 Claims. (Cl. 95—75)

1. In a moving picture printing machine the combination of a film sprocket adapted to have a positive and negative film mesh simultaneously therewith, a control drum adapted to have the positive film travel over the periphery thereof, an annular guide flange on said control drum,

a pressure roller, an annular ridge on the periphery of said pressure roller, said negative film being adapted to travel under said pressure roller to have said annular ridge make contact with the negative film and force said negative film into frictional contact with the positive film while traveling over said control drum, means for guiding the positive roller back into mesh

with said film sprocket and a guide roller adapted to guide the negative film at a slight angle away from said pressure roller to slightly turn the film under the annular ridge of said pressure roller and force one edge of the negative film against said guide flange of said control drum into alignment with the corresponding edge of the positive film at the point of contact between the two films on said control drum.

2,098,368

MANIFOLDING ATTACHMENT FOR WRITING MACHINES

Hans Ziegler, Zollikon-Zurich, Switzerland

Application January 23, 1936, Serial No. 60,424
In Switzerland March 28, 1935
3 Claims. (Cl. 197—126)

1. A device on typewriters for making copies by means of auxiliary ribbons consisting of a rod mounted on the platen-carriage of the typewriter, at least one support to be attached to said rod, a shaft revolvably mounted in lateral parts of said support, said shaft consisting of two parts joined and guided by a piece of tube containing a helical spring between the ends of said joined two parts, the latter being pushed away from each other under the action of said spring, said axial displacement of said two parts being limited by keys inserted in said tube, the exterior ends of said shaft each possessing an arm curved corresponding to the circumferential curving of the platen, the free end of said arm being adapted for supporting an auxiliary ribbon provided with end-pieces.

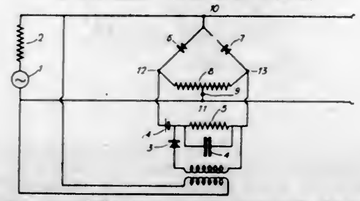
2,098,369

PIPE HANDLING TOOL

Lawrence F. Baash, Los Angeles, Calif.

Application June 21, 1935, Serial No. 27,753
1 Claim. (Cl. 81—186)

In a tool for gripping pipe and like objects, a jaw part having a groove in its active face, the groove including a portion spirally curved in one direction and a portion spirally curved in the other direction, and a die comprising spirally curved sections fitted in the said portions of the groove



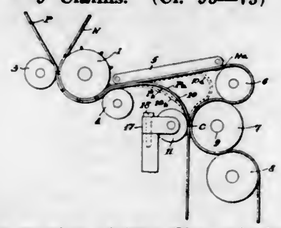
to be in end to end relation, and gripping teeth on the sections spirally curved to substantially follow the margins of their respective sections and extend both axially and circumferentially of the object or pipe being gripped.

2,098,370

AUTOMATIC CONTROL OF AMPLIFICATION

Hans Bartels, Berlin-Spandau, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application October 28, 1935, Serial No. 47,089
In Germany November 5, 1934
9 Claims. (Cl. 179—100.1)



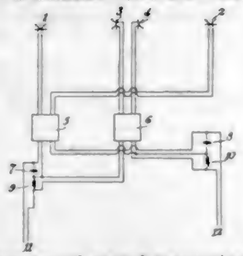
1. An amplification ratio control device including a bridge element comprising a resistor and a pair of rectifiers, a pair of terminals connected to said bridge element respectively at a point between said rectifiers and to an intermediate terminal of said resistor, and means operable to apply to the end terminals of said resistor a potential which varies as the volume of the signal supplied to said terminals.

2,098,371

PRINTER

Alda V. Bedford, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application December 29, 1933, Serial No. 704,436
9 Claims. (Cl. 95—75)



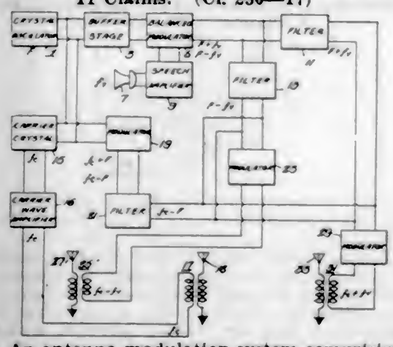
9. In a moving picture film printing machine the combination of a film sprocket for simultaneously feeding the positive and negative films from their respective supply reels, a rotatable drum spaced from said film feeding sprocket, a pair of film guiding members for guiding one of said films around the drum and in frictional contact

therewith, a pressure roller of smaller diameter than said drum under which the other film is passed, and by which it is forced into frictional contact with the first said film on said drum, at an angle to the direction of the movement of the films after leaving said feeding means in order to form a loop in said other film which stretches the emulsion side of the said other film before making contact with the first named film, thus causing both films to travel at a constant speed at their point of contact regardless of any changes in the length of said other film and means for photographically printing the negative film onto the positive film at their point of contact.

2,098,372
SOUND-TRANSMISSION, SOUND-RECORDING, AND SOUND-REPRODUCING SYSTEM

Alan Dower Blumlein, West Ealing, London, England, assignor to Electric & Musical Industries, Limited, Blyth Road, Hayes, England

Application October 31, 1934, Serial No. 750,898
In Great Britain October 23, 1933
2 Claims. (Cl. 179—1.2)

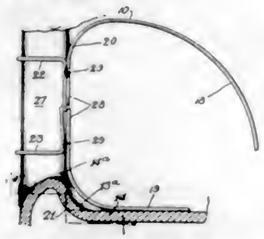


1. In a system of sound transmission comprising a plurality of microphones connected to a plurality of loud speakers, two comparatively closely spaced microphones adapted to pick up high frequency sounds, two more widely spaced microphones adapted to pick up sounds of lower frequencies, and means in the circuits from each pair of microphones adapted to transmit differences of phase between the impulses received from the microphones, over at least part of the frequency range being dealt with, as differences of loudness in the loud speakers.

2,098,373
ANTENNA CIRCUIT MODULATION

George H. Brown, Haddonfield, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application July 16, 1936, Serial No. 90,825
11 Claims. (Cl. 250—17)

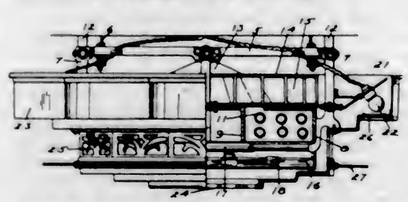


1. An antenna modulation system comprising a plurality of antennas, means for impressing an unmodulated carrier current on one antenna, means for impressing an upper side band current on a second antenna, means for impressing a lower side band current on a third antenna, and means for minimizing radiation coupling between said antennas.

2,098,374
SINK STRAINER BRACKET

Charles H. Bullock, Evanston, Ill.

Application January 8, 1936, Serial No. 58,086
3 Claims. (Cl. 248—94)

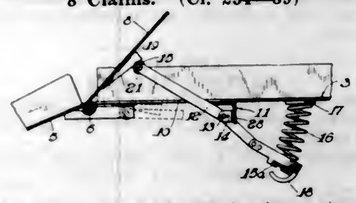


2. A bracket for removably receiving and supporting a conventional sink strainer of substantially triangular form in one of the vertical corners of a conventional sink and with its bottom spaced above the bottom of the sink, comprising a body fashioned from a metallic strand and having two angularly related spans which are projected at substantially right angles from a common center and an arcuate span connecting the remote ends of said two spans whereby to receive said strainer perimetrically adjacent the top thereof, and a pair of spaced engagement members extending laterally from one of said two spans and spaced from said common center sufficiently to avoid the usual up-curve at the juncture of the top of the sink side and the sink back so that said two right angularly related sides of the bracket may fit closely within the vertical corner formed at such juncture in the sink.

2,098,375
SPACE CONDITIONER

Lachlan W. Child, South Bend, Ind., assignor, by mesne assignments, to Air Devices Corporation, Chicago, Ill., a corporation of Delaware

Original application June 8, 1934, Serial No. 729,544. Divided and this application May 22, 1936, Serial No. 81,230
3 Claims. (Cl. 257—1)

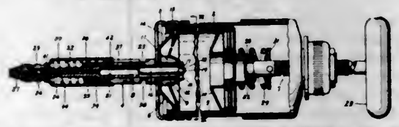


1. A space conditioner comprising a casing having an air inlet opening in its lower portion and an open top, heat transfer means in the casing, a fan in the casing to circulate air from the space therethrough, an annular air deflector mounted in the casing adjacent the top thereof with its radially inward edge below the fan outlet, and a light source between said deflector and the casing for distributing light to the space.

2,098,376
CHOCKING DEVICE FOR VEHICLE LIFTS

James M. Cunneen, Jersey City, N. J., assignor to The Lubrication Corporation, Chicago, Ill., a corporation of Delaware

Application August 23, 1934, Serial No. 741,040
8 Claims. (Cl. 254—89)

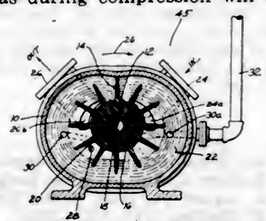


3. In a motor vehicle lift having a track arranged to be raised and lowered, a ramp pivoted adjacent one end of the track, a chock member independently pivoted coaxially with said ramp and an operating member for said chock member comprising a lever pivoted intermediate its ends with one end adapted to engage the chock and move it into operative position as the track is raised and the other end adapted to engage the ground to move said first end in a direction away from the chock as the track is lowered.

2,098,377
LUBRICATING DEVICE

Adiel Y. Dodge, South Bend, Ind., and Harry R. Tear, Evanston, Ill., assignors to The Lubrication Corporation, South Bend, Ind., a corporation of Delaware

Application May 26, 1934, Serial No. 727,604
8 Claims. (Cl. 221—47.4)

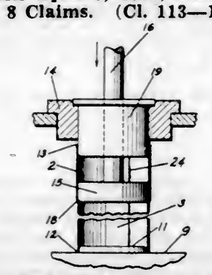


1. A lubricating device comprising, in unit assembly, a high pressure pump having a piston, a low pressure lubricant supply source for said pump including an interchangeable lubricant supply cartridge having a discharge outlet and quick detachable means to secure said cartridge to the pump with its outlet in communication with the pump inlet, means adapted to be moved into operative relationship with said cartridge for placing the lubricant in said cartridge under low pressure, and means operable at will for retaining the pump parts in such relationship as to provide minimum lubricant space between the cartridge outlet and the discharge port of the pump from which lubricant may be discharged during the immediately succeeding pump cycle, said space being less than the displacement of said pump piston.

2,098,378
AIR-CIRCULATING EQUIPMENT

Adiel Y. Dodge, South Bend, Ind.

Application November 8, 1934, Serial No. 752,042
13 Claims. (Cl. 261—28)

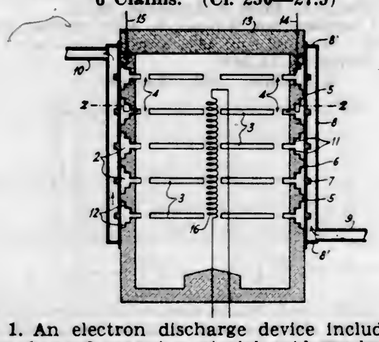


11. An air conditioning compressor and expander comprising a non-circular casing, a vaned rotor in said casing closely approaching the casing at two points, and gas inlet and outlet ports in the casing on opposite sides of each of said two points whereby gas admitted through said inlet port will be compressed and then expanded before being discharged through said outlet port whereby at least a part of the energy absorbed by the gas during compression will be returned to the rotor thereby during expansion and means to cool the compressed gas prior to its expansion.

2,098,379
LUBRICATING DEVICE AND METHOD OF MANUFACTURE

Adiel Y. Dodge, South Bend, Ind., assignor to The Lubrication Corporation, Chicago, Ill., a corporation of Delaware

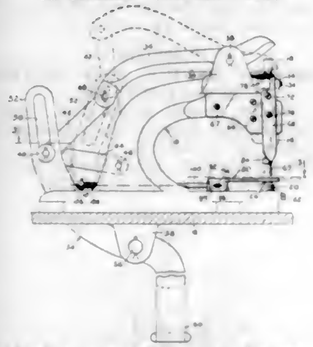
Application April 5, 1935, Serial No. 14,792
8 Claims. (Cl. 113—120)



1. The method of forming a sheet metal cylinder which comprises, rolling a relatively thin rectangular metal sheet into the form of a cylinder, joining the adjacent edge portions of said sheet in a seam, and forcing a planishing tool axially through said cylinder to smooth out the irregularities in the inner side wall of the cylinder and to assure uniform inside diameter thereof and to reduce to a negligible amount the irregularity resulting from the seam.

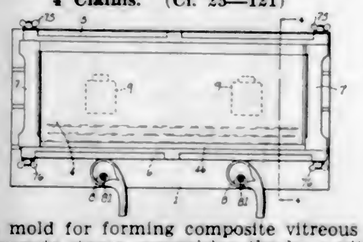
2,098,380
GAS DISCHARGE DEVICE

Alfred Engelmann and Günther Wolf, Berlin, Germany, assignors to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany



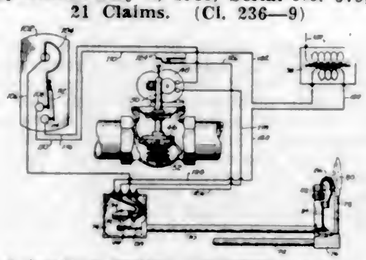
Application July 13, 1937, Serial No. 153,328
In Germany July 19, 1936
6 Claims. (Cl. 250—27.5)

1. An electron discharge device including an envelope of ceramic material, said envelope having a slot extending through the wall of said en-



velope, a metallic electrode positioned on the outside of and sealed to said envelope and closing said slot, a thermionic cathode filament within said envelope and a control electrode supported in the wall of said envelope in registry with said slot and out of contact with the electrode outside of said envelope.

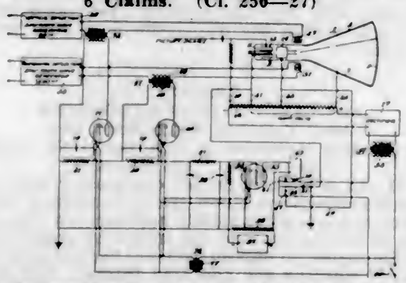
2,098,381
SAFETY DEVICE
Harry A. Fine, Flushing, N. Y., assignor to I. B. Kleinert Rubber Company, New York, N. Y.
Application August 14, 1935, Serial No. 36,160
18 Claims. (Cl. 192—130)



1. Apparatus comprising a frame, a tool mounted in said frame for movement to retracted position and to work-engaging position, and releasable means for preventing movement of said tool to work-engaging position, said means comprising a member in fixed relation to said tool and movable therewith, a stop member pivotally mounted on said frame in the path of movement of said first member to engage the latter and thereby prevent movement of said tool to work-engaging position and movable out of said path to permit movement of said tool to work-engaging position, and a lever pivotally mounted on said frame and having an operative connection with said stop member for moving the latter out of said path, said lever having a slot and said connection comprising a stud fixed to said stop member and projecting into said slot for engagement with said lever, said stud having limited movement in said slot to limit the movement of said stop member.

2,098,382
MOLD FOR MANUFACTURING COMPOSITE VITREOUS TILE AND CONCRETE STAVES
Percy C. Fish, Kalamazoo, Mich.
Original application August 1, 1931, Serial No. 554,430. Divided and this application July 17, 1935, Serial No. 31,789
4 Claims. (Cl. 25—121)

1. A mold for forming composite vitreous tile and concrete staves, comprising the base with a stop rail at the rear, a rear mold rail having a groove for forming a tongue, a front mold rail having a rib for forming a groove, end mold bars having clamps for forming a frame to cooperate with a vitreous tile having rib projections to engage said stop rail and front rail to position and hold the said rails in proper spaced relation to said vitreous tile, eccentric clamps for clamping the said positioned tile and mold against the stop rail, and a vibrator to agitate the concrete into place.

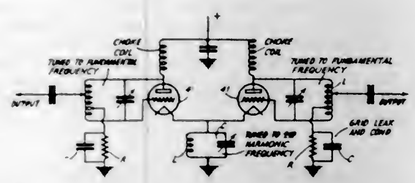


2,098,383
HEATING SYSTEM
Francis A. Furlong, Chicago, Ill., assignor to Autogas Corporation, Chicago, Ill., a corporation of Delaware
Application July 8, 1933, Serial No. 679,521
21 Claims. (Cl. 236—9)

1. A heating system comprising a room-temperature control device having a first thermostatic switch set for a lower limit and a second thermostatic switch set for an upper limit and having an intermediate range, a heating plant having a combustion chamber, an electrical device controlling the operation of said plant, a third thermostatic switch controlled by the combustion chamber temperature, and an electrical control system for said electrical device having parallel circuits one of which includes the first and second thermostatic switches and the other of which includes the second and third thermostatic switches, together with a pilot-controlled safety switch automatically operable to open both circuits if the pilot of said plant goes out.

14. A safety pilot comprising in combination a pilot burner, a temperature responsive means located in proximity to said burner, and means positioned to divert a portion of the flame issuing from said burner on to said temperature responsive means and which means encircles and protects one side of the temperature responsive means.

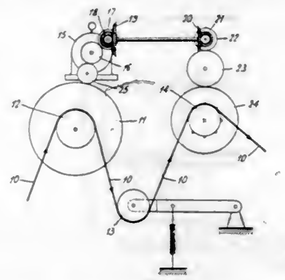
2,098,384
PROTECTIVE SYSTEM
Robert R. Goodrich, Camden, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application May 19, 1934, Serial No. 726,442
6 Claims. (Cl. 250—27)



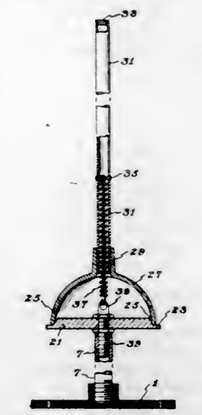
1. In combination, a cathode ray tube having a fluorescent screen, means within the tube for developing a cathode ray and directing it toward the screen, means for deflecting the ray across the screen according to a pre-determined recurrent pattern, a ray-accelerating anode within the tube, connections for supplying a potential to the anode and means for depriving the anode of potential and connecting it to ground upon failure of the ray-deflecting means.

2,098,385
RECLAIMING METHOD
Fred W. Hall, Nutley, and Norman R. Wilson, Belleville, N. J., assignors, by mesne assignments, to The Stamford Rubber Supply Company, Stamford, Conn., a corporation of Connecticut
No Drawing. Application September 30, 1936, Serial No. 103,368
2 Claims. (Cl. 106—23)

1. The method of cyclically reclaiming and reducing to a fine powder rubber like scrap whether raw or vulcanized, natural or synthetic which consists in bringing together said scrap and a quantity of vulcanizable oil; then effecting a vulcanization of said oil to solidify it and form together with said scrap a large cake; then progressively abrading away the major portion of said cake, then again treating as scrap the residual portion of said cake as aforesaid with fresh quantities of vulcanizable oil; and continuing the sequence of operations.



2,098,386
OSCILLATION GENERATOR
Clarence W. Hansell, Port Jefferson, Long Island, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Original application August 1, 1933, Serial No. 683,115. Divided and this application May 24, 1935, Serial No. 23,171. In Canada June 29, 1934
13 Claims. (Cl. 250—36)

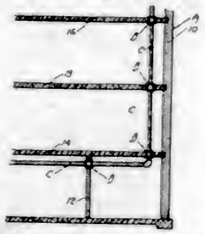


1. The method of obtaining a desired phase relation between the outputs of a plurality of electric tube oscillators which comprises utilizing harmonic frequency energy to produce a degenerative effect in said oscillators at phase relations other than the desired relation.

2,098,387
FILM DRIVE MECHANISM
Adolf Heine, Berlin-Zehlendorf, Germany, assignor to Klangfilm G. m. b. H., Berlin, Germany, a corporation of Germany
Application May 1, 1935, Serial No. 19,137
In Germany July 25, 1934
10 Claims. (Cl. 271—2.3)

1. The combination of a film drive mechanism, a film driven flywheel, and means operable to couple said flywheel to said mechanism a fixed time interval after initiating the operation of said mechanism.

2,098,388
DEFLECTABLE ANTENNA
Leo J. Hruska, Merchantville, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application November 30, 1935, Serial No. 52,313
5 Claims. (Cl. 250—33)

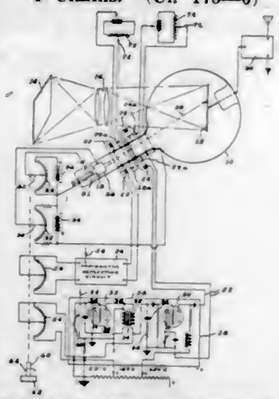


1. A deflectable antenna comprising a fixed section, a deflectable section, a base member mounted on one of said sections, a cup shape member mounted on the other of said sections, and a spring under tension for firmly engaging said base and cup shape members, the relative shape and junction of said members being such as to insure a good high frequency contact and to exclude moisture.

2,098,389
ADJUSTABLE PIPE SLEEVE WITH FLOOR AND CEILING PLATE
J Howard Hutchison, Enfield, Pa.
Application June 11, 1937, Serial No. 147,635
5 Claims. (Cl. 72—105)

1. A pipe sleeve adapted to be inserted in the space defining the floor prior to the pouring of concrete which comprises a sleeve having its curved bounding surface threaded, a complementary interfitting sleeve with threads upon its curved bounding surface whereby the sleeves may

be screwed together in order to extend or contract the length of the sleeve, a paper tube surround-



ing the curved bounding surface of the interfitting sleeve parts.

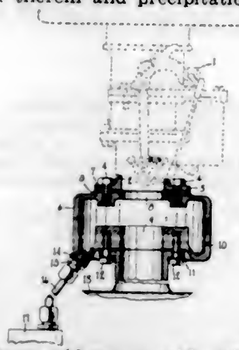
2,098,390

TELEVISION TRANSMITTING APPARATUS

Harley Iams, East Orange, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application May 26, 1934, Serial No. 727,763
4 Claims. (Cl. 178—6)

1. In television transmitting apparatus, a scanning device for developing picture signals comprising a tube provided with screen structure and with means for developing a cathode ray and directing the same at said structure, means for varying the intensity of the ray, means for deflecting the ray through a given angle in one direction and means for deflecting the ray simultaneously through a given angle in another direction to cause the ray to scan a given area of the surface of said screen structure, control means for varying the angle of ray-deflection by said first-named ray-deflecting means, control means for varying the angle of ray-deflection by said second-named ray-deflecting means, and means common to said two control means and said means for varying the ray intensity to actuate the same simultaneously and in such sense to cause either simultaneous increase in both angles of ray-deflection and increase in the ray-intensity or simultaneous decrease in both angles of ray-deflection and decrease in the ray-intensity.



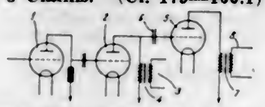
2,098,391

GASOLINE SAVER

Ward M. Irvin, Battle Creek, Mich.

Application January 2, 1936, Serial No. 57,095
5 Claims. (Cl. 183—107)

5. In a device of the type described, a hollow casing having inlet and outlet openings, said inlet and outlet openings being in register and the passageway between said inlet and outlet openings being unobstructed, said casing being of substantially greater diameter than said inlet and outlet openings permitting expansion of gasoline vapor therein and precipitation of gasoline



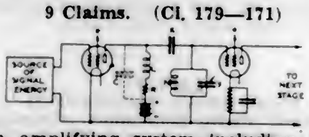
particles from said vapor, said casing communicating freely with the space between said openings through an annular passage of substantial area, a well in said casing to collect the precipitate, and means to drain the precipitate from said well.

2,098,392

SOUND TRANSMITTING SYSTEM

Ernst Kammerer, Berlin-Tempelhof, Germany, assignor to Klangfilm G. m. b. H., Berlin, Germany, a corporation of Germany

Application August 3, 1935, Serial No. 34,516
In Germany July 14, 1934
3 Claims. (Cl. 179—100.1)



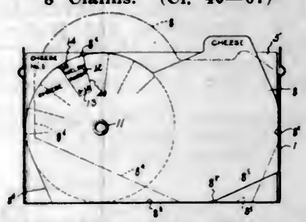
1. A sound-transmitting system including a main loudspeaker and a monitoring loudspeaker, an amplifier for actuating the main loudspeaker, a driving amplifier for actuating said first amplifier, and an amplifier having a higher gain than the first of said amplifiers connected to said driving amplifier for actuating said monitoring loudspeaker.

2,098,393

COUPLING ARRANGEMENT

Ernst Klotz and Erich Zepler, Berlin, Germany, assignors to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany

Application May 14, 1932, Serial No. 611,259. Renewed August 17, 1934. In Germany July 2, 1931
9 Claims. (Cl. 179—171)



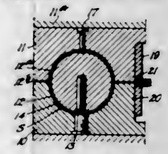
1. An amplifying system including a circuit tuned to signal frequency and an inductance coupled to said tuned circuit, said inductance together with its associated capacities determining a natural frequency less than, but not greatly less than, the lowest frequency to which said tunable circuit may be tuned, the value of the coupling between said inductance and tuned circuit being of the order of twenty percent, and means for increasing the resistance of said inductance sufficiently to make the power factor of said inductance too poor to permit of sharp resonance effects at the said lower frequency.

2,098,394

RECIPE FILE

Herbert G. Lane, New York, N. Y., assignor to Oxford Filing Supply Co., a partnership comprising Richard A. Jonas, Richard A. Jonas, Jr., Robert P. Jonas, Frank D. Jonas, and Edward F. Jonas, New York, N. Y.

Application December 2, 1936, Serial No. 113,781
8 Claims. (Cl. 40—67)



1. An index device as described comprising a card, having a bottom which comprises two portions extending at an angle to each other whereby the card may be oscillated by depressing opposite ends thereof, said card having a window therein and an indicator movably mounted thereon in back of the window.

2,098,395

PROCESS OF AND APPARATUS FOR MOLDING HOLLOW RUBBER ARTICLES

James Allan Law, Kensington, Victoria, Australia

Application August 16, 1934, Serial No. 740,128
In Australia August 24, 1933
4 Claims. (Cl. 18—42)

1. Mold devices for plastic rubber comprising two co-operating parts having spaced apart cavities in registry, means to support a core centrally in each cavity of one of the mold parts, a wall on one mold part entirely surrounding the area of the mold and projecting beyond the said mold part to close the space between the said mold parts while they are in spaced apart position and apertures in said wall, and means in the other mold part to engage the cores to cause the adjacent faces of the mold parts to be spaced apart a short distance when the molds are closed to their most adjacent position and when the mold parts are in such position the apertures in the wall register with the space between the said parts.

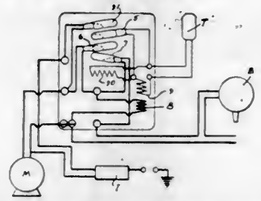
2,098,396

AIR CONDITIONING METHOD AND APPARATUS FOR PASSENGER CARS

Leo L. Lewis, Plainfield, N. J., assignor, by mesne assignments, to Carrier Corporation, Newark, N. J., a corporation of Delaware

Application January 12, 1933, Serial No. 651,287
14 Claims. (Cl. 62—117)

1. The method of conditioning air for a passenger car train which consists in chilling a cooling fluid in a master car and conducting said fluid by means of conduits from the master car to the passenger cars in the train, shunting



the fluid from said conduits to a cooler in each passenger car in the train, and drawing the air to be cooled over said cooler and discharging said cooled air into the car.

2,098,397

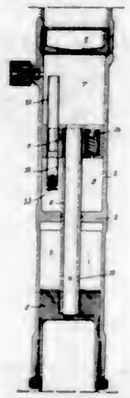
ELECTRICAL CONTROL

Ira E. McCabe, Chicago, Ill.

Original application March 20, 1933, Serial No. 661,759. Divided and this application November 11, 1935, Serial No. 49,224
6 Claims. (Cl. 158—28)

3. In combination with a motor operated fuel feeding mechanism and ignition means, a control system therefor including a motor circuit, a normally open motor switch in said circuit, a relay for closing the motor switch in said motor circuit, a secondary circuit for controlling the operation of said relay and including therein a room thermostat, an ignition device connected in parallel with the motor circuit, a normally closed ignition switch in the ignition circuit, a temperature responsive mechanism operable when heated by the combustion of the fuel to open the ignition switch, means normally locking the ignition switch when opened by said temperature responsive means, a thermal release for the locking means, an electrically operated heater therefor in the relay secondary circuit and an electrical resistance element in series therewith, the combined resistances of heater and element being such as to prevent sufficient energization of the relay to close the motor switch upon establishment of the secondary circuit, a shunt circuit about said electrical heater, a normally closed release switch in the shunt circuit operatively connected with the ignition switch to move therewith to open the shunt circuit with the opening of the ignition circuit whereby upon subsequent energization of the secondary circuit the thermal release releases the locking means to permit the ignition and release switches to close when the combustion responsive means attains its normal cold position, a second shunt circuit about both resistances including a switch normally open and adapted to be closed by the combustion responsive mechanism upon the establishment of combustion before the release switch is opened.

2,098,398



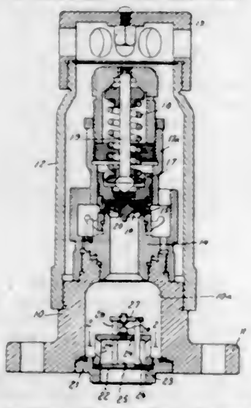
SHOCK ABSORBER

Jean Mercier, Neuilly-sur-Seine, France

Application March 12, 1936, Serial No. 68,492
In France March 19, 1935
14 Claims. (Cl. 267—64)

1. In a damping device, in combination, a container, fluid compressing means provided with two opposite walls adapted to be moved towards and away from each other, communicating means between said container and said fluid compressing

ing means, whereby said fluid compressing means is adapted to discharge fluid into said container and to receive fluid from said container when said opposite walls are moved with relation to each other, intercepting means frictionally connected to one of said opposite walls and adapted to be controlled by the other of said walls after a relative displacement between said opposite walls from their initial relative position corresponding to a portion of their maximum relative displacement and adapted to close said communi-



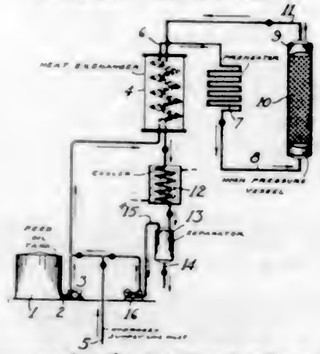
cating means after said portion of the maximum relative displacement and to open said communicating means as soon as said opposite walls are returned towards their initial relative position, a check valve in said communicating means adapted to check the circulation of the fluid only in one direction in said communicating means, and a small passage between said container and said fluid compressing means permanently allowing a reduced circulation of fluid between said container and said fluid compressing means.

2,098,399

CHEMICAL MANUFACTURE

Horace D. Munson, Niagara Falls, N. Y., assignor to The Mathieson Alkali Works, Inc., New York, N. Y., a corporation of Virginia

Application December 4, 1935, Serial No. 52,783
8 Claims. (Cl. 220—89)



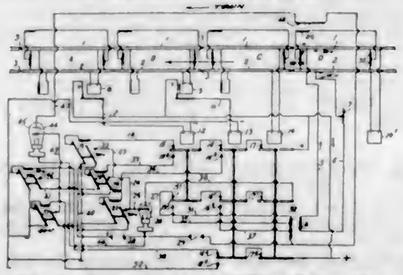
1. A protective device for closing a passage against the flow of a fluid under pressure which comprises a rupturable diaphragm closing said passage and exposed on one face to said fluid, and means normally out of contact with said fluid for supporting said diaphragm against rupture, said means including a supporting element in contact with the other face of said diaphragm and movable upon rupture thereof, and a frangible member operatively connected to said supporting element and normally preventing movement thereof by said diaphragm, said member being subjected to a pulling strain by the pressure of the fluid acting through said element.

2,098,400

PROCESS FOR HYDROGENATING DISTILLABLE CARBONACEOUS MATERIALS

Mathias Pier, Heidelberg, and Walter Simon and Walter Kroenig, Ludwigshafen-on-the-Rhine, Germany, assignors to Standard-I. G. Company, Linden, N. J., a corporation of Delaware

Application December 22, 1932, Serial No. 648,436
In Germany January 2, 1932
3 Claims. (Cl. 196—53)



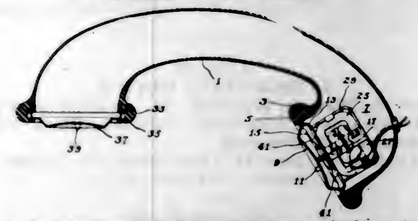
1. A process for the treatment with a hydrogenating gas of a distillable carbonaceous material which comprises treating the said carbonaceous material with the said gas at a temperature between 250 and 700° C. and under pressure of at least 20 atmospheres while in contact with a catalyst comprising a mixture of tungsten sulphide and manganese bromide.

2,098,401

AUTOMATIC RAILROAD SIGNALING AND CONTROL SYSTEM

Charles William Walker Prescott, Pymble, Australia

Application September 15, 1934, Serial No. 744,233
17 Claims. (Cl. 246—6)



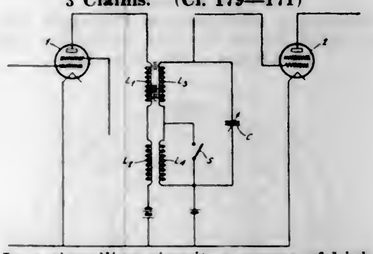
1. An electric system of railroad signaling incorporating a plurality of segregated successive track circuits, means for circulating two electric currents in each of said track circuits, one of said currents having a frequency which is dependent upon and variable with the length, up to a predetermined maximum length, of clear track ahead of that circuit, and the other of which currents having a frequency which is dependent upon and variable with the overall physical conditions affecting train speed of the said length of clear track, operating in combination with means, carried by a rail vehicle moving over one of said track circuits for separately picking up by induction said two currents in that track circuit, and an indicating instrument, carried by said vehicle, which is operated by said two induced currents in combination.

2,098,402

TELEPHONE APPARATUS

Carl N. Reifsteck, Haddonfield, and Glenn L. Dimmick, Oaklyn, N. J., assignors to Radio Corporation of America, New York, N. Y., a corporation of Delaware

Application December 1, 1933, Serial No. 700,484
2 Claims. (Cl. 179—103)



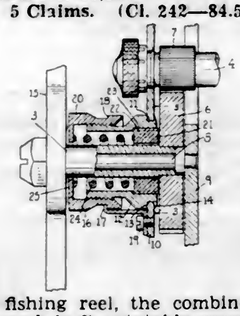
1. A telephone unit comprising a hollow tube of resilient material and shaped to have a mouthpiece at one end and an earpiece at the other end, a diaphragm located in said tube and positioned transversely thereof, and a single reversible electro-mechanical unit having an armature connected to said diaphragm, said unit also being located inside said tube and being resiliently supported thereby.

2,098,403

HIGH FREQUENCY COUPLING ELEMENT

Herre Rinia and Theodorus Anthonius Spoor, Eindhoven, Netherlands, assignors to Radio Corporation of America, a corporation of Delaware

Application August 28, 1934, Serial No. 741,784
In Finland July 4, 1929
3 Claims. (Cl. 179—171)



3. In a signalling circuit, a source of high frequency voltage including a first electronic tube provided with an anode and a cathode, a utilizing circuit including a second electronic tube, input terminals for said utilizing circuit, a coupling system provided with segregated alternating current and direct current paths, said coupling system including a coil, a connection between one terminal of the coil and the anode, a circuit connecting the other terminal of the coil to the cathode of the first tube, and a second coil connected across the input terminals, said second coil being provided with a shunt tuning condenser, capacity between said first and second coils through which alternating current is transferred from the source to the utilizing circuit, mutual inductance between said coils of such polarity and magnitude that current flowing in the second coil induces a voltage in the first coil which is substantially equal and opposite to the voltage impressed across the first coil by virtue of its connection across the anode and cathode of said first tube whereby alternating current is prevented from flowing in the circuit connecting the first coil to the cathode of the first tube.

2,098,404

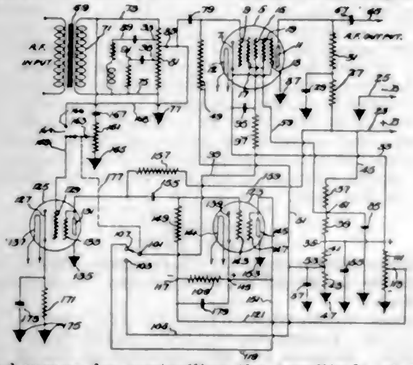
FISHING REEL

William Shakespeare, Jr., Kalamazoo, Mich., assignor to Shakespeare Company, Kalamazoo, Mich.

Original application March 21, 1935, Serial No. 12,138. Patent No. 2,035,279, dated March 24, 1936. Divided and this application March 14, 1936, Serial No. 68,820
5 Claims. (Cl. 242—84.5)

1. In a fishing reel, the combination with a frame, a crankshaft rotatably mounted on said frame, and a gear mounted on said crankshaft, of a collar surrounding said crankshaft in spaced concentric relation, an annular brake member splined in said collar for coaction with the side of said gear, a coiled compression spring surrounding said crankshaft, a brake adjusting member threaded on said collar and bearing against said spring for urging said brake member into braking engagement with said gear through said spring, the adjusting member having an external annular recess, and a stop fixed to said frame for coaction with said last named recess to limit the movement of said adjusting member on said collar.

2,098,405



DYNAMIC AMPLIFIER

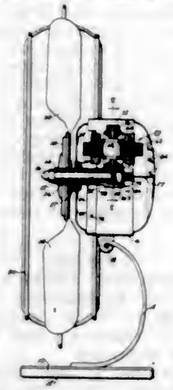
Chester M. Sinnett, Westmont, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application September 30, 1935, Serial No. 42,982
12 Claims. (Cl. 178—44)

1. In a volume expander system for audio frequency signals, an electric discharge amplifier device having two independent control grids in the space path thereof, means for applying audio frequency signals to be amplified to one of said control grids, volume control means for said signals interposed in circuit between said last named means and said one of said control grids, a signal rectifier device having an output resistor, means providing a series bias supply connection for the second control grid through said output resistor, means including a series resistor and a by-pass capacitor between the second control grid and the cathode providing a filter in said connection, a buffer amplifier including an elec-

tric discharge amplifier device coupled to said rectifier, means for applying audio frequency signals to said rectifier through said amplifier,

and means for controlling the amplitude of said last named signals independently of said first named volume control means.

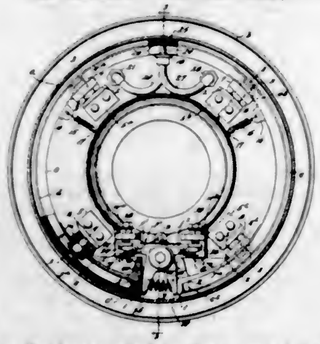


2,098,406
GAME APPARATUS
Vincent F. Slezak, Chicago, Ill., assignor to A. B. T. Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application May 15, 1935, Serial No. 21,492
5 Claims. (Cl. 273—121)

5. Amusement apparatus including a pair of reels and a flexible element attached to the same and adapted to be wound back and forth thereon responsive to turning of the reels in opposite directions, a manikin mounted on said flexible element for movement therewith, driving mechanism operable to turn a particular one of said reels to wind said flexible element thereon, releasable latching means normally preventing retrograde movement of said particular reel, energy storing means adapted to be energized responsive to the winding movement of said particular reel and adapted when said latch means is released to releasably wind-in said element from said particular reel, together with control means for releasing said latching means, and means for operating said driving mechanism to turn said particular reel to move said flexible element in the manner aforesaid.

2,098,407
VENTILATING FAN
Marshall A. Smith, Jr., South Bend, Ind., assignor, by mesne assignments, to Air Devices Corporation, Chicago, Ill., a corporation of Delaware
Application June 8, 1936, Serial No. 84,012
7 Claims. (Cl. 230—272)

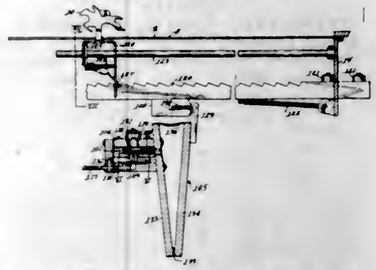
1. A fan having a driving motor including a driving shaft, a substantially horizontal supporting shaft projecting below said motor at right angles to the driving shaft in one plane and at an angle in another plane and so constructed and arranged that the center of gravity of the motor is positioned directly above the supporting shaft, driving means between the driving and supporting shafts, a bladed fan resiliently supported on the supporting shaft, a casing surrounding the



motor, and resilient means supporting the motor in the casing.

2,098,408
LUBRICATING DEVICE
John A. Watson, Hinsdale, Ill., assignor to The Lubrication Corporation, Chicago, Ill., a corporation of Delaware
Application June 11, 1934, Serial No. 730,005
9 Claims. (Cl. 221—47.3)

1. A cartridge of the character described comprising a hollow imperforate cylindrical body, a piston slidably mounted in said body in sealing engagement with the side wall thereof completely around its circumference, and means secured to the body side wall and movable toward and away therefrom and engageable with said piston for locking the piston against rearward movement in the body subsequent to the advance of the piston inwardly of the body beyond said means.

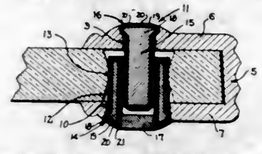


2,098,409
VEHICLE BRAKE
Richard A. Whittingham, Perryville, Md.
Application March 29, 1934, Serial No. 718,067
19 Claims. (Cl. 188—152)

1. In a fluid operated brake, a rotatable brake drum, a brake shoe support, a resilient tubular

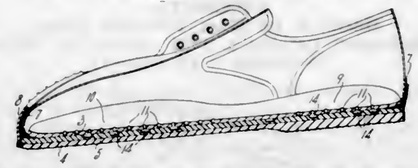
brake shoe within the drum and endwise movable on the support, means for forcing fluid into the shoe, means associated with the shoe for causing the shoe to expand radially into contact with the drum by the fluid pressure in the shoe, and a stop on the support for limiting the endwise movement of the shoe.

2,098,410
MECHANICAL GAME APPARATUS
Homer S. Williams, Youngstown, Ohio, assignor to Pace Manufacturing Company, Inc., Chicago, Ill., a corporation
Application May 25, 1934, Serial No. 727,505
34 Claims. (Cl. 273—86)



1. A game apparatus comprising a raceway formed with starting and finishing ends, a plurality of racing objects positioned for longitudinal movement over said raceway, pneumatically actuated means provided in connection with said objects for moving them over said raceway, means including a tracker bar and a perforated strip associated with said pneumatically actuated means for controlling the operations of said pneumatically actuated means, valve means associated with said pneumatically actuated means and positioned at the finishing end of said raceway and operated by the first racing object reaching said finishing end to discontinue the operation of said pneumatic means, and means for returning said racing objects to the starting end of said raceway.

31. In a device of the kind described, in combination, a stationary supporting bar, a racing figure carrier reciprocably mounted thereon, a locking member slidably reciprocative on the bar and tiltable thereon to and from cramped locking engagement with said bar, and engaging and movable with the carrier, and when locked to said bar holding the carrier from forward but permitting its rearward movement, means for moving the locking member from locking engagement with said bar, and mechanical means which exerts a continuous yielding pressure against said locking member tending to force the latter into cramped locking engagement with said bar.

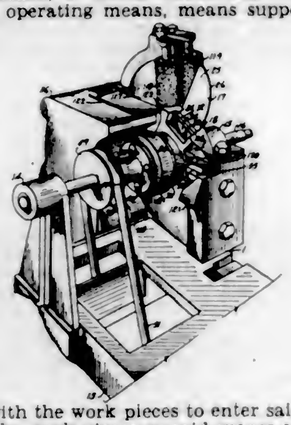


2,098,411
PLATED ARTICLE
William J. Wrighton, Southbridge, Mass., assignor to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts
Application March 16, 1934, Serial No. 715,963
2 Claims. (Cl. 113—112)

1. A method consisting in coating a body of base metal having a relatively high electric resistance and which is normally of a corrosive and tarnishable nature with an electrically deposited plating of a material having a non-corrosive and non-tarnishable nature but which is relatively soft and non-durable, coating said non-corrosive plating with an electric plating of rhodium to obtain the color desired of said body and to form a relatively durable surface thereon, plating the rhodium surface with a coating of material which will alloy with solder and with said rhodium surface on the application of heat and then soldering said coated metal body to an-

other body having a surface thereon which will adhere to solder by placing the said bodies in correlated relation with each other, associating solder with said bodies and applying heat thereto of sufficient temperature to bring about alloying of the coating on said rhodium surface with said surface and alloying of the solder with the surfaces of said correlated bodies which when cool will secure them together.

2,098,412
RUBBER SOLED FOOTWEAR
Norman Everett Bovay, Naugatuck, Conn., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware
Application June 16, 1936, Serial No. 85,462
2 Claims. (Cl. 36—3)

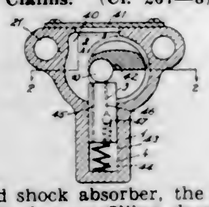


1. An article of footwear comprising an upper of fibrous material, an inner sole having a plurality of perforations disposed throughout the heel and ball areas, an outer sole of rubber composition, a filler disposed between the outer sole and the inner sole and having a plurality of channels formed in the inner sole engaging face which channels extend to the side edges of the filler and are in communication with said perforations in the inner sole, and a foxing placed around the edges of the outer sole, the filler and the upper and secured to the outer sole, filler and upper by a vulcanized bond, said foxing having a plurality of small perforations of the order of one-sixteenth inch in diameter, at least some of which are in accidental alignment with the openings of the filler channels whereby passageways are provided for the circulation of air from the interior of the article through the foxing, the admission of dirt through the foxing is materially reduced owing to the small size of the openings, and an ornamental effect is produced.

2,098,413
STRIPPING MACHINE
Dietrich Daneke, Topeka, Kans., assignor to Fred M. Brackett, Topeka, Kans.
Application October 16, 1936, Serial No. 105,924
15 Claims. (Cl. 164—68)

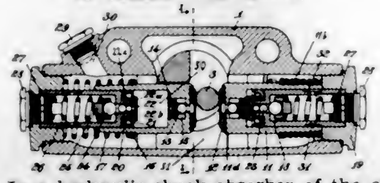
1. In a machine of the character described, means for moving work pieces in a fixed path while connected in spaced relation by a continuous strip, means for severing said strip includ-

ing a knife, means mounting the knife for movement across and shifting movement in the direction of movement of the work pieces, knife operating means, a clutch connecting the knife with said operating means, means supported in



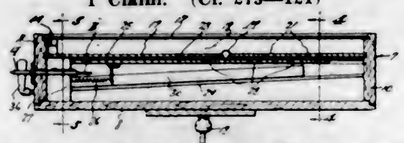
contact with the work pieces to enter said spaces between the work pieces as said spaces approach the knife, and means actuated by said contact means to render the clutch effective in actuating the knife to sever the strip.

2,098,414
ELECTRICAL CONTACT MEMBER FOR CONDUITS
Martin J. De Mask, Pittsfield, Mass.
Application October 2, 1934, Serial No. 746,548
10 Claims. (Cl. 247—3)



1. In a system for distributing power, a conduit, a bus bar disposed therein, means for supporting said bar within said conduit, a contact clip having opposed walls spring pressed toward each other and means for holding said clip within said conduit and electrically connected to said bar, said clip being positioned to receive a contact making blade, the spring pressed walls of said clip being arranged to embrace a blade with one wall of the clip interposed between the embraced blade and the adjacent bar whereby contact is maintained between said blade and said clip and contact between said blade and said bar is avoided.

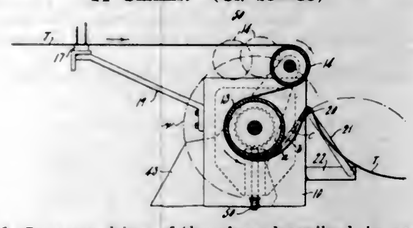
2,098,415
FLUID SHOCK ABSORBER
Fritz Albert Deutsch, Berlin, Germany, assignor to Francisco Liebhold, Brussels, Belgium
Application April 18, 1934, Serial No. 721,123
In Germany September 6, 1932
2 Claims. (Cl. 267—8)



1. In a fluid shock absorber, the combination of a housing having a refilling chamber, a shaft journaled in said housing and provided with at least one depression and at least one cylindrical pin disposed within said depression, a dampening mechanism arranged in said housing, said dampening mechanism substantially comprising cylinder and piston members movable against each other and internally forming a working chamber and a spring arranged between said cylinder and piston members and adapted to urge one of said members against said pin, at least one channel leading from said working chamber to said refilling chamber, and regulating means disposed in said channel and adapted to control the retarding effect of said dampening mechanism.

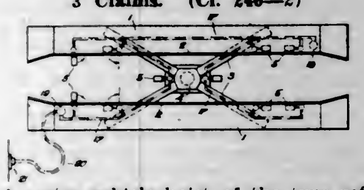
2,098,416
HYDRAULIC SHOCK ABSORBER
Fritz Albert Deutsch, Berlin, Germany, assignor to Francisco Liebhold, Brussels, Belgium
Application May 9, 1935, Serial No. 20,532
In Germany May 9, 1934
13 Claims. (Cl. 267—8)

1. In a hydraulic shock absorber of the character described, the combination of a casing having a refilling chamber, a shaft journaled in said casing and provided with actuating means, dampening means substantially consisting of a cylinder member and a piston member, movable against each other and internally forming a working chamber, one of said members being fastened to the casing the other contacting with said actuating means, an automatic refilling valve arranged in the movable member, regulating means to control the dampening effect of said dampening means disposed substantially in the longitudinal axis of the stationary member fastened to the casing, and said stationary member being provided with a connecting channel leading from the substantially highest point of the working chamber to the regulating means.



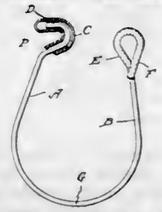
2,098,417
GAME
Barney L. Fisher, Oklahoma City, Okla.
Application July 22, 1936, Serial No. 91,819
1 Claim. (Cl. 273—121)

In a marble game apparatus, the same including a housing, a play board horizontally mounted in the upper part of the housing and upon which marbles may be rolled for play, the board having openings through which the marbles may be dropped, and a carrier board mounted in the housing below the play board and arranged for conveying the marbles forwardly to a fixed delivery point, an elevator arranged at the said delivery point, the same comprising an elevator arm pivotally mounted at one end so as to oscillate vertically between the said delivery point of the carrier board and the play board level for the



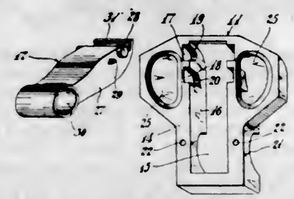
purpose of elevating marbles from the carrier board to the play board, and a baffle arm pivoted medially to oscillate across the delivery point of the carrier board in a plane of movement parallel to the plane of movement of the elevator arm, one end of the baffle arm overlying a medial point of one face of the elevator arm and being slotted longitudinally thereat and a pivot pin passed through said slot of the baffle arm and seated in the elevator arm, whereby depression of the elevator arm for engaging the marbles from the delivery point of the carrier board will operate to raise the free end of the baffle arm to clear said delivery point of the carrier board for admitting marbles from the carrier board onto the elevator arm.

2,098,418
APPARATUS FOR EQUALIZING THE TENSION OF THREADS
Raymond S. Francis, Rumford, R. I., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware
Application May 12, 1936, Serial No. 79,255
11 Claims. (Cl. 28—35)



1. In a machine of the class described, in combination, mechanism for drawing forward simultaneously a number of threads, means for equalizing the tension of the individual threads supplied to said mechanism, including a pair of power driven tension regulating rolls spaced apart to provide a free passage for the threads therebetween and one of which rolls is supported at a higher level than the other, said rolls being positioned so that said threads pass over and part way around the upper roll and form a loop about the lower roll, and a thread support spaced laterally from the lower roll to hold the threads in a looped condition about the lower roll, whereby each thread is free to sag away from the lower tension regulating roll as it becomes slack and embraces this roll as it becomes taut, the arrangement being such that the slack or taut condition of each thread controls independently of the other threads its gripping engagement with said rolls and the rate at which it is pulled forward thereby.

2,098,419
MOTOR VEHICLE HOIST
Joseph Done Handley, Liverpool, England
Application June 22, 1936, Serial No. 86,572
In Great Britain December 11, 1935
3 Claims. (Cl. 246—2)



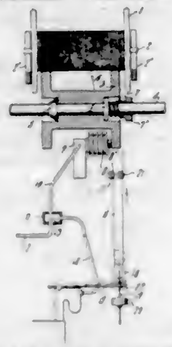
1. A motor vehicle hoist of the type referred to, wheel platforms thereon on to which the vehicle to be raised is run, a series of electric lamps fitted to the platforms and serving to illuminate the underside of the vehicle on the hoist, said lamps being carried by brackets fixed on the underside of the platforms, the brackets being mounted for swivelling movement to enable their being turned from a protected position under the platforms into a position for illuminating the underside of the vehicle, a wiring system connecting said series of lamps to a connector element on the hoist, said wiring system being housed in conduits fixedly secured to the platforms, and a source of electric current supply tapped from the connector on the hoist, said series of lamps and wiring system comprising a permanent installation of the hoist.

2,098,420
HOLDER FOR CABLE RINGS
Francis E. Jackson, deceased, late of Los Angeles, Calif., by Mildred E. Jackson, administratrix, Los Angeles, Calif.
Refiled for abandoned application Serial No. 462,915, June 21, 1930. This application April 5, 1937, Serial No. 135,180
3 Claims. (Cl. 206—46)

1. A holder for hooked end cable rings, comprising an elongated sheet folded longitudinally upon itself to provide two spaced apart walls, and having both walls bent in a hook-shaped formation approximating the configuration of the hooked ends of the cable rings, said holder being open at an end for insertion and removal of the hooked ends of the cable rings.

2,098,421
HANDLE MECHANISM
Ben F. Johnson, Cambridge City, Ind., assignor to National Metal Products Co. Inc., Connersville, Ind., a corporation of Indiana
Application January 2, 1937, Serial No. 118,853
5 Claims. (Cl. 16—112)

1. In a handle mechanism, in combination, a plate member having an opening therein and being adapted to be secured to an object to be lifted, and also being provided with two sets of slots therein, an arm member for cooperating with said plate member and being provided with two sets of lugs, said lugs and slots being so constructed and arranged as to provide for assembly of said arm member with said plate member by passage of the arm member through said opening from the back side of the plate member, one set



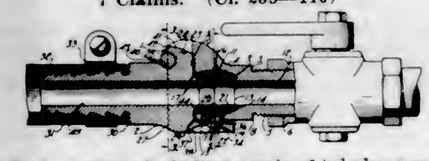
of said lugs engaging one set of said slots to form a hinge connection for the assembly, and the other set of said lugs engaging the other set of slots as said arm member swings through said opening to the front side of said plate member, to provide a stop for movement of said arm member.

2,098,422

CONSTANT TENSION CONTROL FOR ELASTIC FILAMENTS

Alexis W. Keen, Passaic, N. J., and Fayette D. Chittenden, Providence, R. I., assignors to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware

Application June 14, 1935, Serial No. 26,542
4 Claims. (Cl. 242—156)



1. A constant tension control for elastic filaments comprising supply means for delivering the filament, a weighted element adapted to be movably supported by the delivered filament, a bellows for controlling delivery from said supply means, means for supplying a gaseous medium under pressure to said bellows, a relief valve for the bellows, and means actuated by said weighted element for operating said valve.

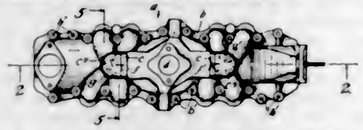
2,098,423

COUPLING DEVICE

Chester B. Kennedy, Junction City, Kans.

Application July 3, 1936, Serial No. 88,774
7 Claims. (Cl. 285—110)

7. A coupling including a pair of tubular members, intercoupling means for the tubular members including locking means movable on one of the tubular members, and cooperative engaging means on the other tubular member, and packing means between the pair of tubular members and having engagement with the locking means and movable responsive to pressure of fluid flowing through the tubular members to retain said locking means in locking engagement with said cooperative means on the other tubular member.



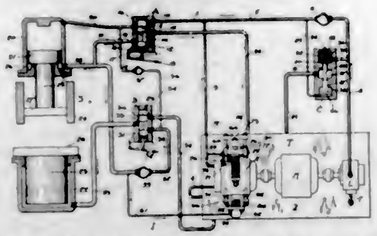
2,098,424

FUEL EQUALIZING MANIFOLD

Peter Kolimbat, Portland, Oreg.

Application August 22, 1936, Serial No. 97,388
4 Claims. (Cl. 123—52)

1. A fuel conditioning and proportioning intake manifold for V-type motors, comprising a single unit casting, a compartment positioned longitudinal and central thereof and a fuel intake port therefor, a chamber of substantial area positioned transverse of said casting and connecting with one end of said compartment, thereby forming a T having outlet ports at one side



registering with inlet ports in one of the cylinder blocks and outlet ports at the opposite side for registering with inlet ports of the opposite cylinder block, and a similarly positioned chamber at the opposite end of the compartment having outlet ports connecting with the remaining inlet ports of the cylinder blocks.

2,098,425

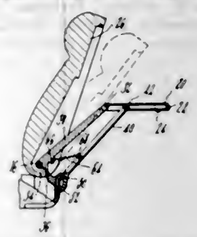
CONTROL MECHANISM FOR PUMPS

Henry W. Landenberger, Philadelphia, Pa., assignor to American Engineering Company, Philadelphia, Pa., a corporation of Pennsylvania

Application March 26, 1935, Serial No. 13,096
9 Claims. (Cl. 60—52)

1. In a fluid system, the combination with a variable stroke pump, of a fluid motor operated by said pump, means for controlling the operation of said motor including a valve, means for placing said pump on stroke, means for returning said pump to leakage stroke position, said last mentioned means comprising a pair of servo motors, one of said servo motors being constantly connected to the discharge pressure in the system and adapted to return the pump to leakage stroke position when the pressure in the system exceeds a predetermined value, means for actuating said valve to control the operation of said fluid motor and to connect the second of said servo motors to said discharge pressure whereby said second fluid motor operates in the same direction as said first mentioned servo motor to return the pump to and maintain the same on leakage stroke position at a comparatively low pressure.

2,098,426



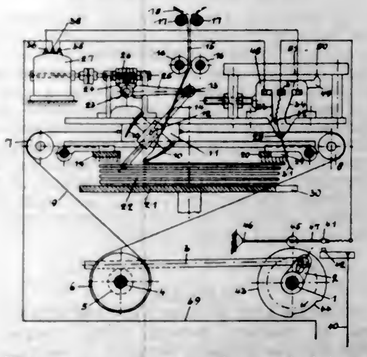
TRAY FOR RECLINER-BACK CHAIRS

Sterling B. McDonald, Chicago, Ill., assignor to Heywood-Wakefield Company, Gardner, Mass., a corporation of Massachusetts

Application July 11, 1936, Serial No. 90,081
10 Claims. (Cl. 155—128)

10. A recliner-back chair, comprising a seat frame, a back pivotally mounted on said frame to rock about a horizontal axis, said back having a shallow recess in the rear face thereof, a tray adapted to fit into said recess flush with the rear face of the back, means for releasably retaining

said tray in said recess, and means carried by said frame for supporting said tray in a horizontal



position independently of the back when released therefrom.

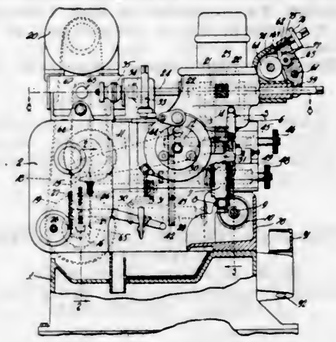
2,098,427

WEB FOLDING METHOD AND APPARATUS

Johannes Menschner, Rosswein, Germany

Application December 19, 1935, Serial No. 55,170
In Germany December 24, 1934
8 Claims. (Cl. 270—79)

1. The process of measuring and determining the length of fold in a web folding machine having pressure-grippers which includes, feeling along the folded edge of the topmost slackened fold to ascertain the actual position of said edge and regulating the length of a succeeding fold in accordance with the deviation of said actual position of the folded edge from the desired position thereof.



2,098,428

MACHINE FOR GENERATING THROATED GEAR ELEMENTS

Edward W. Miller, Springfield, Vt., assignor to The Fellows Gear Shaper Company, Springfield, Vt., a corporation of Vermont

Application January 24, 1931, Serial No. 510,958
6 Claims. (Cl. 90—9)

1. A machine for generating throated helical gear elements which comprises a work spindle, a cutter spindle, means for supporting said spindles rotatably with their axes non-intersecting and transverse to one another, means for effecting relative reciprocation between said spindles in the direction of the axis of the cutter spindle whereby a gear shaper cutter carried by the latter spindle is caused to pass endwise across the side of a work piece carried by the work spindle and make transverse cuts therein, means for simultaneously rotating the spindles about their respective axes at speeds such as to cause a generative progression of the cuts formed in the work piece, and means for incrementally oscillating the cutter spindle in timed relation with said reciprocative movements such as to cause

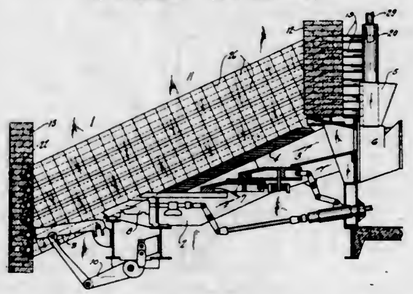
action alternately at opposite sides of the cutter teeth during alternate cutting strokes.

2,098,429

RUBBER COMPOUND

John D. Morron, Detroit, Mich., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application June 10, 1936, Serial No. 84,473
5 Claims. (Cl. 106—23)



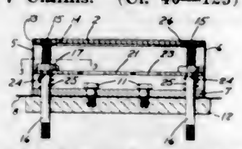
4. A molded vulcanized hard rubber product containing prior to cure, at least 30% by weight based on the rubber of sulphur and 15–200% by weight based on the rubber of wood charcoal of at least 260 mesh.

2,098,430

FURNACE WALL

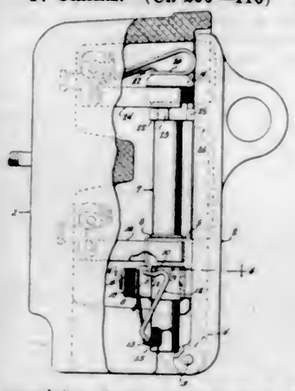
Charles L. Myers, Overbrook, Pa., assignor to American Engineering Company, Philadelphia, Pa., a corporation of Pennsylvania

Application January 23, 1937, Serial No. 122,014
15 Claims. (Cl. 122—4)



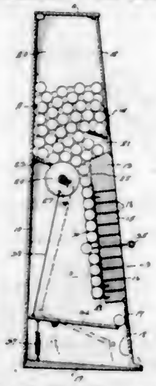
15. In a furnace, having front, rear and side walls, the combination of fluid cooled sections for said side and rear walls comprising, a pair of headers mounted exteriorly of said front wall, a third header mounted intermediate the ends of said rear wall, a series of fluid conducting tubes extending rearwardly from each of said first mentioned headers in substantially parallel relation with said side walls, said tubes being bent near their rearwardly disposed ends so as to lie in substantially parallel relation with said rear wall, and said tubes terminating in said third header.

2,098,431
WATER TREATING COMPOSITION
Everett P. Partridge, Brookside Farms, Bethel Township, Pa., assignor to Hall Laboratories, Inc., Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Application October 31, 1936, Serial No. 108,639
6 Claims. (Cl. 210—23)



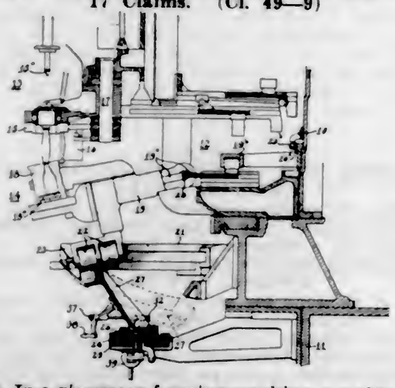
1. A water treating composition comprising a molecularly dehydrated phosphate containing finely divided metal which reacts with dissolved oxygen in water at boiler temperatures.

2,098,432
SYSTEM AND MEANS FOR AUTOMOBILE IDENTIFICATION
Clyde O. Roose, Elyria, Ohio
Application December 30, 1935, Serial No. 56,666
7 Claims. (Cl. 40—125)



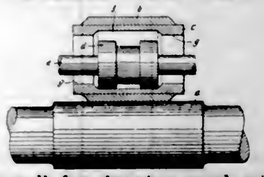
1. A plurality of identification tags, a retainer for holding said tags, said retainer having an aperture for revealing the characters on one of the tags, means for mounting said retainer on a plate, said means being concealed after the first tag has been inserted, and cooperating locking means on the tags and in the retainer to permanently lock all of said tags within said retainer.

2,098,433
FUSE
William O. Schultz, South Milwaukee, Wis., assignor to Line Material Company, South Milwaukee, Wis., a corporation of Delaware
Application January 10, 1935, Serial No. 1,084
17 Claims. (Cl. 200—116)



1. An expulsion fuse comprising a fuse tube having an open end, a fuse link within said fuse tube, and fuse link retracting means comprising a U-shaped pivoted member normally partially straddling said fuse tube and having a bail portion over which said fuse link is looped after passing from the open end of said fuse tube, said U-shaped pivoted member being resiliently urged to rock outwardly away from said fuse tube to thereby retract said fuse link, said U-shaped member being resiliently held in its outward position away from said fuse tube after said fuse link has been ruptured.

2,098,434
PUNCHBOARD GAME APPARATUS
Herman L. Smith, Grifton, N. C.
Application November 17, 1936, Serial No. 111,320
7 Claims. (Cl. 312—49)



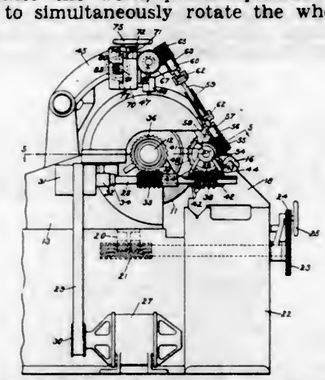
1. In a game of the character described, an element having a vertical row of perforations, a semi-tubular guideway extending vertically behind the element and aligned with the row of perforations and formed to provide a vertical series of pairs of inwardly curved resilient wings, the guideway being adapted to receive a series of globular objects having a diameter approximately equal to the cross section of the guideway and approximately equal to the vertical length of each pair of wings, the vertical row of perforations in the element opening into the guideway each before the middle of a pair of wings.

2,098,435
GLASSWARE FORMING MACHINE
Leonard D. Soubier, Toledo, Ohio, assignor to Owens-Illinois Glass Company, a corporation of Ohio
Application January 24, 1935, Serial No. 3,228
17 Claims. (Cl. 49—9)

2. In a glassware forming machine, a mold carriage mounted for rotation about a vertical axis, a blank forming unit thereon including partible cooperating body blank and neck molds, means for forming a blank in said molds, means for then opening the body blank mold and leaving a bare blank suspended from the neck mold, a partible finishing mold arranged below said blank forming unit, mechanism for raising said finishing mold to a position at which it closes about the said blank, means for advancing or retarding the point at which said mechanism is operated to thereby regulably control the point at which the blank is exposed to the atmosphere during its transfer to the finishing mold and means for accelerating the speed of operation of said mechanism to thereby shorten the period of time during which the blank is exposed to the atmosphere.

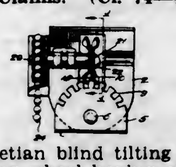
2,098,436
TOP ROLL
Wilhelm Stahlecker, Stuttgart-Bad-Cannstatt, Germany, assignor to Vereinigte Kugellagerfabriken Aktiengesellschaft, Stuttgart-Bad-Cannstatt, Germany, a corporation of Germany
Application March 27, 1936, Serial No. 71,080
In Germany March 29, 1935
3 Claims. (Cl. 19—142)

1. A top roll for drawing mechanisms, comprising a shaft, a bearing body carried by the shaft, an outer shell provided with a special coat, the bore of the outer shell being somewhat larger in diameter than is the diameter of the bearing body, thereby being loosely fitted and freely rolling on the bearing body, the shell being provided with inwardly projecting flanges for engaging the bearing body to guide and locate the shell.



2,098,437
HAIR CLIPPING IMPLEMENT
Theodore Steinbach, Millburn, N. J.
Application August 10, 1936, Serial No. 95,055
18 Claims. (Cl. 30—43)

2. A hair clipping implement comprising a handle and a head removably attached to said handle, said head having a base and a slanting roof with a cylindrically formed outer surface of unidirectional curvature, a thin strip forming the eaves of said roof and having an outer surface curved in the same sense and continuously with said cylindrically formed surface, teeth formed by parallel slots in said strip, a movable cutter between said base and said roof provided with teeth in sliding contact with the teeth in said strip, said eaves extending laterally beyond the movable cutter, and means for giving said cutter a reciprocating motion.

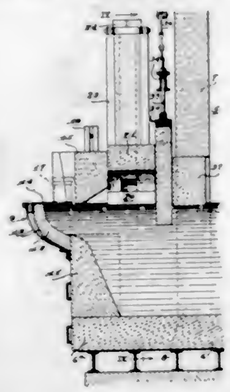


2,098,438
GRINDING MACHINE FOR GRINDING NON-CIRCULAR SHAPES
Everard Stubbs, Springfield, Vt., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts
Application May 19, 1932, Serial No. 612,232
6 Claims. (Cl. 51—105)

1. A grinding machine for grinding a rotatable work piece having the line of grinding contact at varying distances from the axis of rotation of the grinding wheel comprising a rotatable grinding wheel shaped as the conjugate of the desired work contour and a support for the rotatable work which are relatively movable for feeding the wheel into the work, power operated driving means to simultaneously rotate the wheel and

work in a definite cyclic phase relation but at different surface speeds at the line of grinding contact, and driving mechanism including a slidable connection between the wheel and the work drive, which permits a relative feeding movement of the wheel and work without disturbing the phase relation of the wheel and work.

2,098,439
SHEET METAL WORM
Walter J. Stuber, Philadelphia, Pa., assignor to Carey-McFall Co., Philadelphia, Pa., a corporation of Pennsylvania
Application June 13, 1936, Serial No. 85,170
7 Claims. (Cl. 74—458)

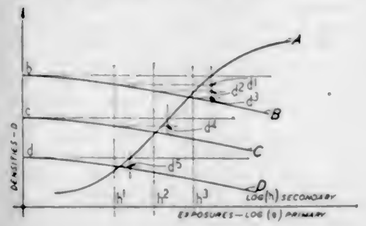


1. In a Venetian blind tilting mechanism including a tilting wheel having circumferentially spaced teeth, a worm cooperating with said toothed wheel and comprising a plurality of identical parts respectively including a central hub section and a peripheral marginal section constituting a segment of a convolution of the worm spiral with said hub and marginal sections being integral and of substantially uniform thickness over the entire areas thereof in the direction of the axis of the worm and with the marginal section of each part disposed in a plane arranged at an angle to the plane of the hub section of said part, said parts being assembled in intermeshing relation to each other with the hub sections thereof in substantially parallel and axial aligned relation one with the other and predetermined portions of said spiral segments of an intermeshing pair of said identical parts spaced apart axially of said worm to receive single teeth of said tilting wheel therebetween.

2,098,440
GLASS MELTING FURNACE
John A. Tassick, Streator, Ill., assignor to Owens-Illinois Glass Company, a corporation of Ohio
Application June 26, 1933, Serial No. 677,594
4 Claims. (Cl. 49—56)

1. In combination, a glass melting furnace including a side wall having an outlet opening

through which glass is adapted to flow from the furnace, a furnace extension exterior to the wall and including a bottom wall disposed at approximately the same level as the bottom of the furnace, side walls for the extension, an upstanding wall at the outer end of the extension, a forebay having its outer margin defined by the upper part of said upstanding wall, said forebay providing an exposed gathering area of glass, a jack



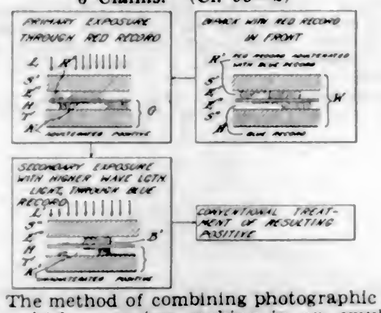
arch defining the inner margin of the gathering area, a conditioning chamber overlying the furnace extension between said jack arch and side wall of the furnace, means for regulably controlling the temperature in said chamber and a vertically movable gate interposed between said side wall and the conditioning chamber for regulably controlling the highest level at which glass may enter said furnace extension.

2,098,441

PHOTOGRAPHIC PROCESS WITH EXPOSURE DIMINUTION

Leonard T. Troland, deceased, late of Cambridge, Mass., by the Cambridge Trust Company, executor, Cambridge, Mass., assignor to Technicolor Motion Picture Corporation, Hollywood, Calif., a corporation of Maine

Application August 10, 1933, Serial No. 684,546
3 Claims. (Cl. 95—5.6)



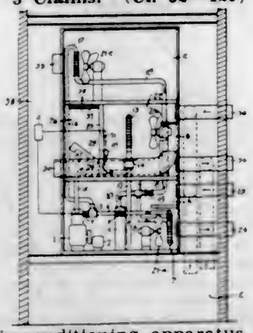
1. The method of controlling the gradation of a photographic gelatin relief, which comprises exposing a photographic emulsion through its support to an object field, uniformly exposing the latent record through said support to light adapted photographically to diminish said record, developing the record and hardening the gelatin coextensive with said record, and removing the gelatin portions not coextensive with the developed record.

2,098,442

PHOTOGRAPHIC PROCESS WITH EXPOSURE DIMINUTION

Leonard T. Troland, deceased, late of Cambridge, Mass., by Cambridge Trust Company, executor, Cambridge, Mass., assignor to Technicolor Motion Picture Corporation, Hollywood, Calif., a corporation of Maine

Original application August 10, 1933, Serial No. 684,546. Divided and this application November 16, 1935, Serial No. 50,161
6 Claims. (Cl. 95—2)



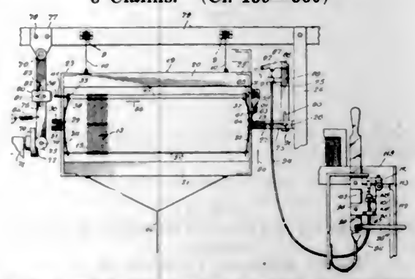
1. The method of combining photographic records, which comprises making in an emulsion layer of the silver halide type a latent record of an object field and in register therewith in a second emulsion layer a substantially permanent record of another aspect of the same field, said first layer receiving a record component substantially in conformity with said second record, and exposing said latent record in register through said permanent record with light photographically diminishing said latent record in amounts controlled by the permanent record, thereby diminishing said component in said first layer.

2,098,443

AIR CONDITIONING APPARATUS

Benjamin R. Vancott, Los Angeles, Calif.

Application February 20, 1936, Serial No. 64,842
3 Claims. (Cl. 62—129)



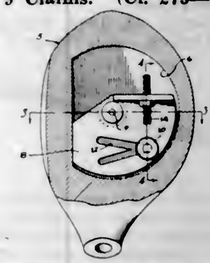
2. An air-conditioning apparatus for a room or the like comprising an evaporator enclosed in a chamber, a primary condenser enclosed in a chamber, a secondary condenser enclosed in a chamber, together with means to circulate air from said room through said evaporator chamber and said primary condenser chamber and return said air to said room; additional means to circulate air from the outside atmosphere through the evaporator chamber and said primary condenser chamber, means to circulate air through the secondary condenser chamber, and means to alternately circulate a refrigerant through said primary condenser and said evaporator, or through said secondary condenser and said evaporator.

2,098,444

MECHANICAL WARP STOP MOTION

Theodor Curt Wagner, Chemnitz, Germany

Application October 30, 1935, Serial No. 47,347
In Germany June 24, 1935
8 Claims. (Cl. 139—360)



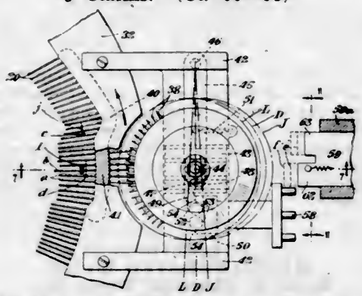
1. In a mechanical warp stop motion for looms, the combination with a heddle frame provided with a series of heddles, a bar which is circular in cross-section and which comprises teeth formed upon one of the surfaces thereof, another bar carrying the first-mentioned bar and having a portion which is U-shaped in cross-section and which is provided with teeth adapted to be situated adjacent the teeth of the first-mentioned bar in the operative position of said bars, each of the teeth of the two bars having an oblique surface and a substantially vertical surface, the vertical surface of a tooth of one bar facing oppositely to the vertical surface of an adjacent tooth of the other bar, one of said bars being rotatable relatively to the other bar about its longitudinal axis, whereby a smooth surface is presented to a heddle falling upon said bars if the rotatable bar is moved from its operative position, one of said bars being reciprocable in the direction of its longitudinal axis relatively to the other bar, the vertical surfaces of the teeth of the two bars being adapted to clamp a fallen heddle situated between them in the course of said relative movement when said bars are in the operative position, whereby the two bars are locked, means supporting said bars, means for reciprocating the first-mentioned means, and a knock-out mechanism comprising means actuated by said bars while they are locked.

2,098,445

GOLF CLUB

William L. Wettlaufer, Buffalo, N. Y.

Application March 11, 1937, Serial No. 130,333
9 Claims. (Cl. 273—77)



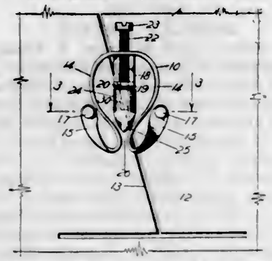
1. In a golf club of the driver type, a club head having an internal recess, a sector-like plate in said recess and means for pivotally mounting said plate so that it is movable during a backswing of the club to concentrate its weight in the vicinity of the heel of the club head and is movable during a down-swing of the said club to concentrate its weight in the vicinity of the toe of said club head, said means being connected to said plate in the vicinity of the point toward which the radially extending sides of said plate converge.

2,098,446

KNITTING MACHINE

Harry Agulnek, Brooklyn, N. Y., assignor to Samuel Mishcon, doing business as Supreme Knitting Machine Co., Brooklyn, N. Y.

Application July 25, 1936, Serial No. 92,533
6 Claims. (Cl. 66—93)



1. In a circular knitting machine, a plurality of circumferentially disposed radially movable sinkers, a rotary selector wheel with peripheral slots therein and movable to three positions with respect to the cylinder, jacks in certain of said slots, the walls of the slots and the jacks being engageable with adjacent sinkers for actuating them radially, the walls of unfilled slots being adapted to move a coacting sinker to a position for receiving yarn over the nose thereof to make a loop stitch when the wheel is in its innermost position, and to a position for receiving the yarn over the throat of the sinker to make a jersey stitch when the wheel is either in its intermediate or outermost position, each jack within a slot being adapted to move a coacting sinker to a position for receiving yarn over the nose thereof to make a loop stitch when the wheel is either in its innermost or intermediate position, and to a position for receiving yarn over the throat of the sinker to make a jersey stitch when the wheel is in its outermost position, and means for operatively actuating the wheel.

2,098,447

PISTON EXPANDER

Lionel D. Bax, Denver, Colo.

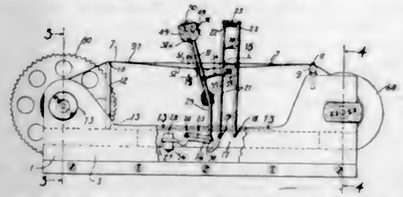
Application April 13, 1936, Serial No. 74,097
5 Claims. (Cl. 309—12)

1. An expander of the character described, comprising a resilient body formed into a central

loop terminating in wings projecting laterally at opposite sides of a narrowed throat, and adapted for attachment to a piston to which the expander is applied, an arm projecting inwardly of the loop, the loop and the arm having alined apertures for the application of an adjusting screw, an adjusting screw operating in the apertures, and a wedge-member carried by the screw within the throat.

2,098,448

COMPLEX COMPOUNDS OF CINCHOPHEN AND ITS DERIVATIVES



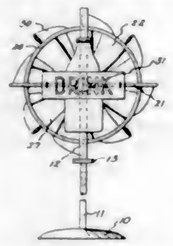
Fritz W. Bramigk, Detroit, Mich.
No Drawing. Application February 2, 1935, Serial No. 4,717
12 Claims. (Cl. 260—39)

1. A complex compound resulting from the interaction of one molecule of a phenyl quinoline carboxylic acid compound selected from the group consisting of neocinchophen, cinchophen, and the alkali-forming metal salts of cinchophen, with at least one molecule of hexamethylene tetramine and at least one molecule of a pyrazolone compound selected from the group consisting of 1-phenyl-2.3-dimethyl-5-pyrazolone and 1-phenyl - 2.3 - dimethyl-4-dimethylamino-5 pyrazolone.

2,098,449

HAND OPERATED LOOM

David C. Churchill, Berea, Ky.
Application December 20, 1935, Serial No. 55,359
4 Claims. (Cl. 139—29)



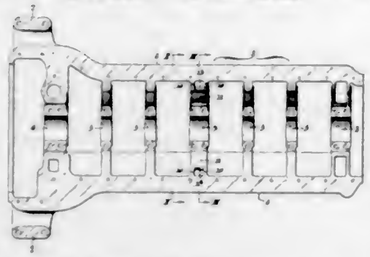
1. In a loom, a main frame, a rotatable cloth beam comprising spaced cylindrical bearing portions, a bore on the frame for one bearing portion, a recess in the frame for the other bearing portion and means for retaining it in the recess, comprising an obstruction projecting into the recess in front of the corresponding bearing portion and resiliently operably yieldable to remove it from recess obstructing position, the beam being removable from the bearing portions by lateral movement from the recess after manually effected operation of the yieldable obstruction and by subsequent longitudinal movement from the bore.

2,098,450

DISPLAY DEVICE

Marcus P. Exline and William F. Beale, Dallas, Tex., assignors of one-third to Daniel J. Lyons, St. Louis, Mo., and said Exline assignor of one-third to Katharine Morgan Exline, Dallas, Tex.
Application December 21, 1936, Serial No. 116,896
4 Claims. (Cl. 40—125)

1. A display device including, a support, a frame mounted to rotate on a vertical axis on the support, a wind-impelled element within the frame and rotatable on a horizontal axis, means on the periphery of the element for rotating the element when the wind is in a direction at substantially a right angle to the face of the element, and a display panel carrying advertising indicia secured to the frame and covering the central portion of the rotatable element, whereby

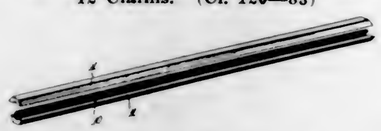


a portion of said element is visible behind the stationary panel.

2,098,451

METHOD OF STRENGTHENING CRANK-CASES

Harry Gilmore, Camden, N. J.
Application July 18, 1936, Serial No. 91,361
1 Claim. (Cl. 29—156.4)

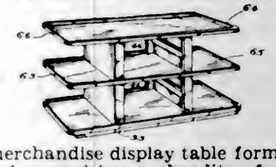


A method of strengthening a weakened crank case having a main bearing supported by two spaced webs having upper edge portions extending from the bearing to the sides of the case which consists of the following steps: forming a flange member of a width proper to connect the upper edge portions of said webs between said bearing and the sides of said casing, positioning the flange member to connect the upper edge portions of the spaced webs in preparation for welding, and welding the positioned flange member to the upper edge portions of the two webs and to said main bearing.

2,098,452

ART OF LEAD PENCIL MANUFACTURE

Karl M. Herstein, New York, N. Y., assignor to Eagle Pencil Company, New York, N. Y., a corporation of Delaware
Application January 31, 1936, Serial No. 61,639
12 Claims. (Cl. 120—83)

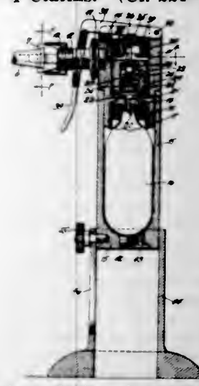


1. The processing of pencil leads which includes the application to the greasy surface of the lead, of a solution of a grease-attacking crystalline salt and evaporating such solution, with resultant crystals in part penetrating the greased lead surface and in part protruding therefrom.

2,098,453

MERCHANDISE DISPLAY TABLE

Leslie S. Janes, John G. Raben, and John Nielsen, Chicago, Ill., assignors to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York
Application October 29, 1936, Serial No. 108,194
14 Claims. (Cl. 312—140.1)

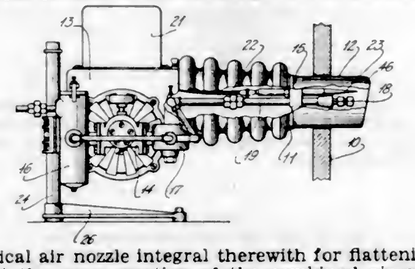


3. A merchandise display table formed of sheet metal and comprising a plurality of shelves and spacing members disposed therebetween and inwardly of the ends thereof, said spacing members having channel shaped ends, the space between said shelves being substantially free at the extremities thereof and between said extremities and said spacing members.

2,098,454

COMPRESSED AIR GUN

Isaac Dee Kelley, Jr., St. Louis, Mo.
Application May 4, 1936, Serial No. 77,797
4 Claims. (Cl. 221—73.5)



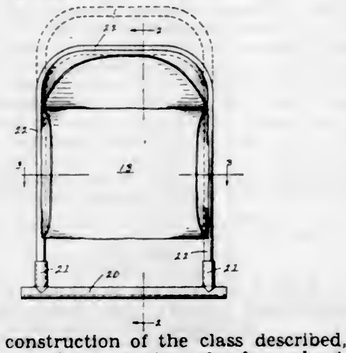
1. A device of the character described comprising a cartridge or shell enclosing compressed air or gas, means for puncturing and for forming a passage from said cartridge or shell for the flow of air or gas therefrom, and a support for said means having an outlet passage therethrough, a member attached to said support, an additional support mounted for sliding movements in said first named support, elastic means supporting and providing a seal for said additional support, a valve controlling passage of air or gas through and from said member, a stem attached to said additional support and engaging said valve, a lever pivoted to said first named support for moving said additional support in opposition to said elastic means to open said valve, and means limiting extent of movement of said lever.

2,098,455

FLUID FUEL BURNER

Emert J. Lattner, Cedar Rapids, Iowa
Application April 27, 1934, Serial No. 722,715
3 Claims. (Cl. 158—76)

1. A fluid fuel burner having a substantially cylindrical air nozzle, a fuel nozzle located within the air nozzle near the discharge end thereof adapted to project fuel flowing therefrom into the air blast to form a combined air and fuel blast, and a crescent-shaped, inwardly-curved lip on the upper portion of the discharge end of the cylin-



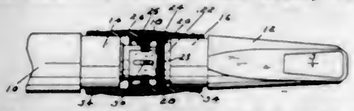
drical air nozzle integral therewith for flattening out the upper portion of the combined air and fuel blast to produce a deformed conical blast bulged out at the sides and flattened at the top.

2,098,456

SEAT BACK

Hubert S. Leader and Henry P. Nordmark, Grand Rapids, Mich., assignors to American Seating Company, Grand Rapids, Mich., a corporation of New Jersey
Application May 20, 1935, Serial No. 22,378
4 Claims. (Cl. 155—178)

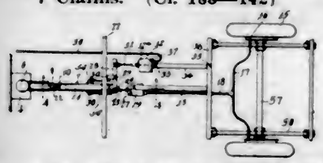
1. In a construction of the class described, a seat back comprising a rectangular frame having panels secured to the opposite sides thereof and whose respective opposite marginal side edges overhang the sides of the frame forming channels in the opposite sides of the seat back, and a frame member for the seat back comprising (1) a tubular member provided with spaced transverse sleeves and (2) a U-shaped tubular member whose opposite lengths embrace the seat back within its opposite channels and whose free ends are engaged within the spaced transverse sleeves.



2,098,457

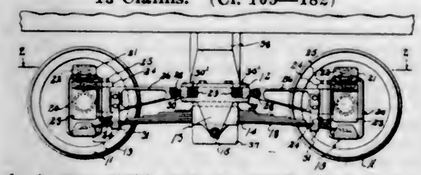
MUSICAL INSTRUMENT

Allen Loomis, Elkhart, Ind., assignor to C. G. Conn, Ltd., Elkhart, Ind., a corporation of Indiana
Application August 15, 1936, Serial No. 96,142
13 Claims. (Cl. 84—386)



1. A tuning device for wind reed musical instruments comprising telescoping sections having respectively right and left external threads and provided with interengaging parts preventing relative turning, a collar surrounding the telescoping portions of said sections and which is provided with internal right and left threads

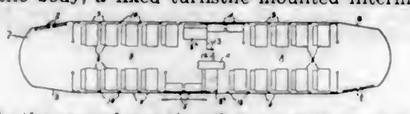
interengaging respectively with said external threads, said collar being operable to shift said sections relatively to each other axially to tune



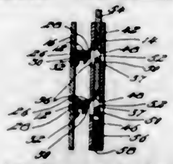
the instrument, and means within said collar for normally limiting separation of said sections to prevent disengagement of the internal and external threads.

2,098,458
TRAILER BRAKE APPARATUS
Fred J. Machovec, Monterey, Calif.
Application September 18, 1936, Serial No. 101,457
7 Claims. (Cl. 188—142)

1. In a trailer brake apparatus, to be used with a towing car having an internal combustion engine with an air intake the combination of a member constructed to be attached to the towing car, a member attached to the trailer, said members capable of relative sliding movement in the front and rear direction, means for applying the trailer brakes when the trailer moves forwardly with respect to the first named member, and means capable of being controlled by the driver of the towing car, including a pneumatic cylinder connected to the engine intake for normally preventing the trailer from relative forward movement with respect to the towing car.



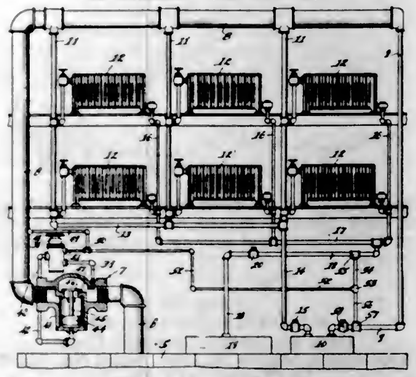
2,098,459
CAR TRUCK
John S. McWhirter, Southport, Conn.
Application June 11, 1935, Serial No. 26,011
13 Claims. (Cl. 105—182)



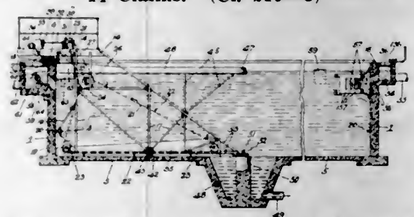
1. A non-rigid vehicle truck comprising a bolster, leaf springs secured to the ends of said bolster, a pair of axles each having a pair of wheels thereon, journal boxes mounted on said axles, swing links interconnecting the ends of the leaf springs with the journal boxes, and side members each pivotally connected at one end to a journal box on a vertical axis and at the other end to the bolster on a vertical axis.

2,098,460
VEHICLE
John S. McWhirter, Southport, Conn.
Application July 25, 1936, Serial No. 92,473
2 Claims. (Cl. 105—341.5)

1. In a vehicle adapted to be operated from either end, the combination comprising a vehicle body having door-ways on opposite sides at each end, and door-ways on both sides intermediate the ends, the second mentioned door-ways being longitudinally spaced with respect to the length of the body, a fixed turnstile mounted intermediate the second mentioned doors with respect to their longitudinal displacement and fixed barrier means cooperating with the turnstile to form a passage-way between the respective ends of the car controlled by the turnstile.

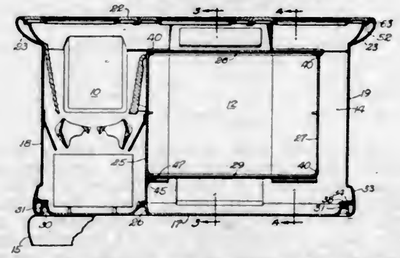


2,098,461
CATCH FOR USE IN DETACHABLY SECURING THE ENDS OF BRACELETS, CHAINS, AND OTHER ARTICLES TOGETHER
Arthur Micallef, Cranston, R. I.
Application May 9, 1935, Serial No. 20,625
2 Claims. (Cl. 24—230)



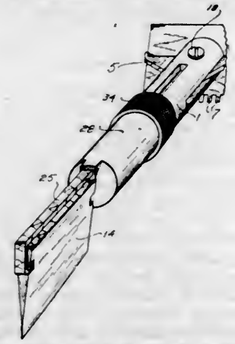
1. A spring catch for use in detachably securing the ends of bracelets, chains and other flat articles together comprising vertically spaced flat prong means, each rigidly projecting from one end of said flat article first in the plane thereof and then substantially at right angles forwardly and with the front end thereof terminating in a cam surface inclined from top to bottom and provided with an indentation in a horizontal edge thereof and an oblong hollow compartment member having the inner vertical edge thereof rigidly secured to the other article end, and having slot means in the rear wall thereof similarly spaced to receive said prong means and a hole in a horizontal wall thereof, a flat slide member vertically slidably mounted in and substantially filling the center portion of said compartment and one end of said slide having an aligning lug projecting vertically centrally thereof, slot means therein similarly vertically spaced to said prong means and compartment slot means, the rear portions of said slide member immediately vertically adjacent said slot means having cam surfaces tapered toward said slot means and an extension projecting vertically through said compartment hole substantially the height of the desired vertical movement of said slide member and spring means mounted in the other end of said compartment to surround said slide member aligning lug and abut the adjacent slide surface whereby on depression of said slide extension said spring means may be compressed to permit alignment of said slide member slot means with said compartment slot means to permit withdrawal of said prong means therefrom and on release of pressure from said slide member extension said spring means may urge said slide member vertically to cause the portions of said slide immediately vertically adjacent said slide member slot means to fit into said prong means indentations to retain said article ends together and said prong means cam surfaces may function with said slide member cam surfaces to permit the automatic insertion of said prong means within said then aligned slot means against the pressure of said spring means.

2,098,462
SELF REGULATED HEAT TRANSFER SYSTEM
Samuel P. Miller, Chicago, Ill.
Application May 15, 1936, Serial No. 79,842
In Canada January 27, 1936
29 Claims. (Cl. 237—9)



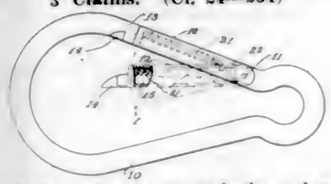
15. In a heat transfer system having a plurality of radiators, a primary supply pipe therefor, a secondary supply pipe therefor having a far end and a return for said radiators, means to prevent expansion of steam in said secondary supply pipe, said means including a control valve between said supply pipes and a control pipe for said valve connected to said secondary pipe and said far end and said return, said means including a valved aperture between said primary and secondary supply pipes, said aperture adapted to be varied inversely in proportion to the average pressure in said secondary supply pipe.

2,098,463
SLUDGE COLLECTOR
George L. Morehead, Philadelphia, Pa., assignor to Link-Belt Company, Chicago, Ill., a corporation of Illinois
Application August 6, 1935, Serial No. 34,944
14 Claims. (Cl. 210—3)



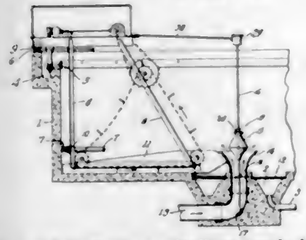
1. In combination in a circular tank adapted to contain liquid, having a relatively flat floor means for supplying liquid to it and for withdrawing liquid from it, and means for removing solid matter from the tank, said means comprising a movably mounted conveying assembly supported upon the tank and means for rotating it bodily about the tank, supported above the floor of the tank, a sludge trough situated in the floor of the tank, and a scum hopper mounted adjacent the liquid level of the tank and adjacent its wall, the conveying assembly carrying means to move material to the trough in the floor of the tank said last mentioned means including a conveyor mounted for relative movement with respect to the remainder of said conveying assembly, and means for giving it such relative movement.

2,098,464
KITCHEN RANGE
George E. Pickup, Newark, Ohio, assignor, by mesne assignments, to Florence-Wehrle Stove Co., Newark, Ohio, a corporation of Ohio
Application January 18, 1935, Serial No. 2,348
12 Claims. (Cl. 126—1)



1. In a kitchen range including a casing having a fire-box on one side therein and an enclosed oven chamber beside said firebox, a flue system leading from said fire-box about said oven chamber for conducting hot products of combustion in intimate contact with said chamber, a base plate forming the lower wall of said casing, means at the edge of said base plate providing an upwardly facing channel, a bottom plate forminto the lower wall of said oven chamber, said bottom plate including a wide downwardly projecting flange formed integrally therewith along one edge, said flange having means at its lower edge fitting within said channel and forming a joint, and a recess within the joint thus formed adapted to receive means for sealing said joint against the escape of flue waste from within said casing.

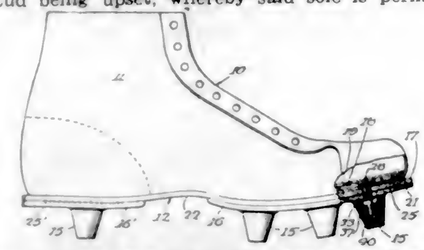
2,098,465
COMBINATION SAFETY RAZOR AND SHARPENER
Joseph Polillo, Ridgefield, Wash.
Application July 14, 1936, Serial No. 90,502
3 Claims. (Cl. 30—35)



1. In a device of the class described, the combination of a safety razor blade having a substantially thick back, a pair of rectangularly sectioned notches disposed in the ends thereof, a pair of notches having a V-shaped section normal to the blade thickness disposed in the ends thereof between the said rectangularly sectioned notches and the said back, a safety razor frame member having two ends and adapted at one end for holding the safety razor blade in position for shaving and adapted at the other end for holding the safety razor blade in position for conditioning the same.

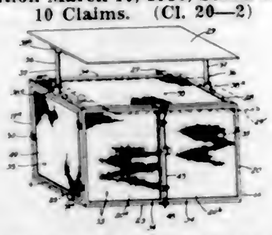
2,098,466
SAFETY HOOK
Ernst Rodenbach, Bloomfield, N. J.
Application November 10, 1936, Serial No. 110,031
3 Claims. (Cl. 24—234)

1. In a safety hook, a hook body and a tongue hingedly interconnected with one another, said tongue comprising a hollow, tubular member, a relatively long, spiral spring under compression within said tongue, the outer diameter of said spring being considerably smaller than the interior diameter of said hollow member for permitting a bodily flexing of the spring within the latter, a support for the spring end nearest to the hinge connection between said hook body and said tongue and engaging a fixed point disposed eccentrically relative to the axis of the hinge connection, said support being free to swing within said tongue.



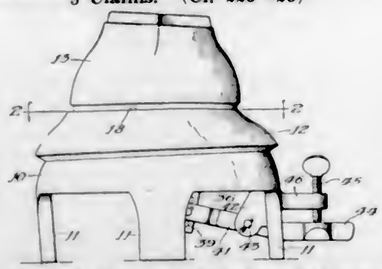
2,098,467
SETTLING TANK
William W. Sayers, Chicago, Ill., and Harold F. Watson, Philadelphia, Pa., assignors to Link-Belt Company, Chicago, Ill., a corporation of Illinois
Application June 15, 1935, Serial No. 26,781
4 Claims. (Cl. 210—55)

1. In combination, a shallow tank having an open top and a flat floor, an effluent weir about the periphery of and adapted to control the level of the liquid within the tank, an influent conduit beneath the bottom, extending from a point outside the boundary of to a point adjacent the center of the tank and there projecting upwardly through the floor, an upwardly and outwardly expanding influent nozzle having its discharge orifice at a point intermediate the floor of the tank and the liquid level as determined by said weir, said influent conduit discharging into said nozzle, deflecting vanes at the discharge orifice masking a portion thereof and curved to guide fluid discharged through the orifice along radial and spiral paths as it passes into the body of the liquid.



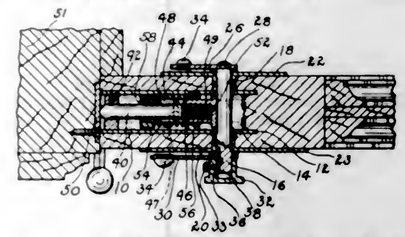
2,098,468
ATHLETIC SHOE
Isadore Shapiro, Chicago, Ill., assignor to The Athletic Shoe Company, Chicago, Ill., a corporation of Illinois
Application February 18, 1935, Serial No. 6,957
7 Claims. (Cl. 36—59)

1. In an athletic shoe, a sole carrying a flexible steel plate, a headed stud extending through said sole and substantially beyond the outer face thereof, said stud having longitudinal teeth in driven engagement with said sole and plate, said stud being upset, whereby said sole is perma-



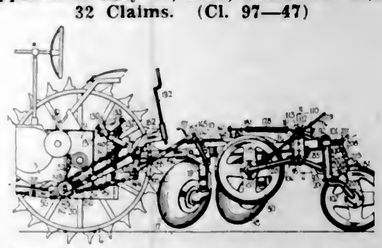
nently clamped between the head of said stud and said binding means, and a tread member having an embedded nut detachably mounted on said stud.

2,098,469
FOLDABLE ENCLOSURE
John W. Smith, Norwalk, Conn.
Application March 10, 1936, Serial No. 68,007
10 Claims. (Cl. 20—2)



1. A foldable enclosure having a stationary side wall; a plurality of movable side walls pivotally associated with said stationary side wall and movable from a normal to a folded position overlying the inner face thereof; and a bottom member secured to said stationary side wall and having a pivotally associated portion movable from a normal position extending inwardly from said stationary side wall to a position overlying the movable side walls when the latter are in a folded position.

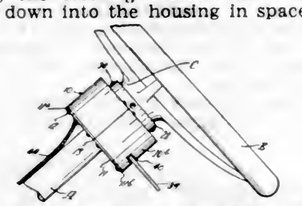
2,098,470
PULLING DIE
Abraham Solosko, Chicago, Ill.
Application May 1, 1936, Serial No. 77,352
5 Claims. (Cl. 223—25)



1. A device of the character described comprising a base, a crown form adapted to rest thereon to provide a die on which a hat may be shaped, and means for clamping said crown form in position on the base comprising aligning means on the base and the crown form, a depending bar inside said crown form, ratchet teeth on said bar, an adjustable pawl in the base adapted to engage said ratchet teeth, means for moving said pawl to draw the bar downwardly whereby to press the crown form against the base.

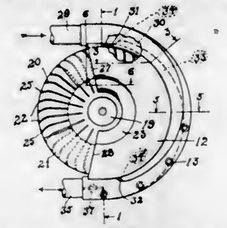
2,098,471
DOOR INDICATING DEVICE
Henry H. Starks, Tacoma, Wash.
Application May 27, 1936, Serial No. 82,145
4 Claims. (Cl. 116—133)

1. The combination with a door and its frame, of a rotary shaft mounted in said door, a weighted, indicating pointer on said shaft having a normally non-indicating position, means operated by the closing of the door for retaining the shaft in adjusted position, and means operated upon the opening of the door releasing said retaining means and the weighted pointer to said non-indicating position.



2,098,472
PLOW
Carl G. Strandlund, Moline, Ill., assignor to Deere & Company, Moline, Ill., a corporation of Illinois
Application May 22, 1935, Serial No. 22,677
32 Claims. (Cl. 97—47)

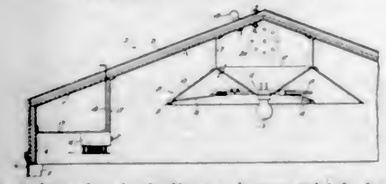
1. A tractor plow comprising an implement frame, means serving as a draft frame connected with said implement frame and adapted to be connected with the tractor for vertical swinging about generally horizontal axes to provide for raising and lowering one end of the plow, supporting wheel means for the other end of the plow and connected with the implement frame for generally vertical shifting movement, and means carried by the tractor for swinging said draft frame and shifting the implement frame relative to said supporting wheel means for raising and lowering the plow.



2,098,473
ELECTRICAL SWITCH
Charles W. Thompson, Albany, N. Y.
Application November 4, 1936, Serial No. 109,069
2 Claims. (Cl. 200—59)

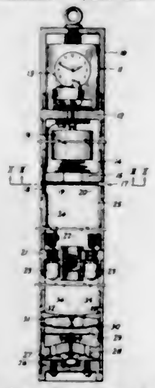
1. A turn signal switch for mounting upon the steering column of an automobile below the steering wheel thereof, the same comprising a lower annular housing section encircling the column below the wheel, this section including an annular bottom an outer cylindrical wall and an inwardly spaced annular bearing neck extended up from the bottom, the neck encircling and being secured to the column, the outer wall also encircling the column in an outwardly spaced relation, an annular cover plate anchored to the wheel and closing the upper end of the lower housing section, the cover plate being rotatable over the lower section and having a depending annular bearing neck encircling the steering column and extending centrally down into the housing in spaced rela-

tion to the upper margin of the bearing neck of the lower section so as to provide an annular space between the two around the column, an operating switch arm formed at its inner end with a flat circular eye slidably encircling the column within the said annular space between the two bearing necks, the outer end of the arm being passed freely out through a slot elongated circumferentially in the outer wall of the lower housing section, and thus arranged for lateral movement, electrical contacts on the opposite margins of the shank of the operating arm within the housing, laterally spaced co-operating contacts within the housing for controlling electrically indicated turn signals such as right and left turns.



2,098,474
DIRECT ACTION AIR COMPRESSOR AND MUFFLER
John R. Tucker, La Crescenta, Calif.
Application May 22, 1935, Serial No. 22,773
18 Claims. (Cl. 230—108)

1. An air compressor comprising a casing having a rotor chamber therein, said chamber extending about within the casing in an arc of a circle and being open to the outside air at its ends, a rotor mounted to rotate about an axis at the center of curvature of the said chamber, said rotor being partially within the chamber and partially in the open air outside the casing, vanes carried by and rigidly attached to the rotor, said vanes when within the casing forming with the casing a series of pockets, the spaces between the vanes being filled with air while the vanes are outside the casing, said casing having a pair of fluid passages extending about the chamber and in open communication therewith and with the pockets therein, means through which a fluid under pressure is admitted to one of said passages and, through it.

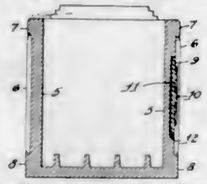


to the said chamber to enter one part of the pockets within the chamber and into direct contact with the air within said pockets, thus to compress said air and force it toward and into the other passage in the casing, and means for cutting off the communication between the pockets and the said other passage before all the air has been forced from the pockets and before substantially any of the pressure fluid has reached the second passage.

2,098,475
BROODER
Boyd W. Warner, North Manchester, Ind., assignor to The Warner Brooder & Appliance Corporation, North Manchester, Ind., a corporation of Indiana
Application February 7, 1936, Serial No. 62,838
5 Claims. (Cl. 119—33)

1. A brooder including a hover which has an anti-clinal roof, end walls and side walls, ventilators mounted in the upper portion of the end walls, and a heating unit supported by the hover, said unit comprising a reflector including a substantially truncated outer cone and a relatively reversed inner cone, and an electric heating element mounted between the outer and inner cones, said heating element being substantially surrounded by free space, whereby substantially free movement of air around said entire heating unit is permitted.

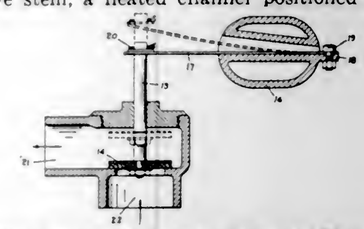
2,098,476
DIRECTIONAL INCLINATION RECORDER
Hugh B. Webster, Oakland, Calif., assignor to Standard Oil Company of California, San Francisco, Calif., a corporation of Delaware
Application November 11, 1935, Serial No. 49,273
5 Claims. (Cl. 33—206)



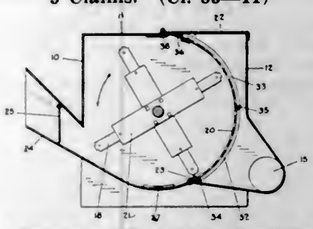
1. An inclination direction indicator comprising means forming a surface concave upwardly, a generally spherical element adapted to rest on said surface, means forming a surface concave downwardly, a fluid in contact with said last named surface, a generally spherical element adapted to be supported in said fluid to contact said last named surface, one of said concave surfaces having a longer radius of curvature than the other so that the element in contact therewith will be displaced a longer distance for a given degree of inclination than will the element which is in contact with the other concave surface, and means for indicating the direction of motion of said spherical elements from the center of said concave surfaces, so constructed and arranged that the direction of inclination of said indicator may be determined from the position of said elements with regard to said last named means.

2,098,477
DISPENSING DEVICE
John Welsh, St. Paul, Minn.
Application September 7, 1935, Serial No. 39,597
8 Claims. (Cl. 206—57)

1. In a device of the class described, a blank of sheet material having its opposite marginal edges provided with suitable loops, said blank being folded around a package of sheet paper with its looped ends spaced apart to provide a dispensing opening, and wire elements insertable in said loops, thereby to secure together said ends in spaced relation.



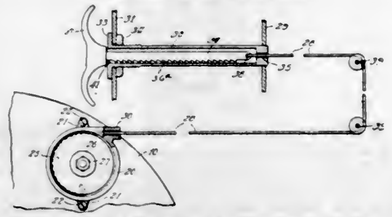
2,098,478
BATTERY CONTAINER
John Westley Young, St. Paul, Minn., assignor to National Battery Company, St. Paul, Minn., a corporation of Delaware
Application January 7, 1935, Serial No. 625
2 Claims. (Cl. 40—2.2)



1. The combination with a molded storage battery container formed with a recess in its outer surface, of a name plate formed from molded, acid-resistant composition having the appearance of an integral part of said container and a coefficient of expansion approximately equal to that of said container, said plate fitting snugly in said recess and being securely bonded to the container wall in said recess.

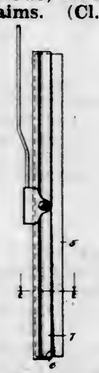
2,098,479
AUTOMATIC CHOKING DEVICE
Charles D. Ammon, Lincoln, Nebr.
Application April 22, 1935, Serial No. 17,675
6 Claims. (Cl. 123—119)

1. In an internal combustion engine, the combination of the air intake of the carburetor with an exhaust pipe, said air intake having a horizontal valve seat, a weighted valve normally seated on said valve seat, a valve stem projecting upwardly from said weighted valve, a bimetallic bar loosely secured to said valve stem, an abutment on said valve stem for limiting upward movement of said bimetallic bar relative to said valve stem, a heated channel positioned transversely through said exhaust pipe, said bimetallic bar passing through said heated channel, and a connection between said exhaust pipe and said bimetallic bar.



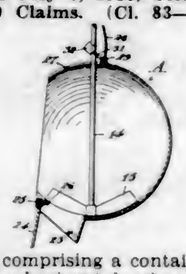
2,098,480
GRINDER
Charles D. Ammon, Lincoln, Nebr.
Application October 14, 1935, Serial No. 44,853
5 Claims. (Cl. 83—11)

4. In a hammer mill, a casing having a grinding chamber therein, a hammer reel in the chamber of the casing, a screen disposed in the rear wall of the chamber within the casing, a screen holding frame in the casing extending from the bottom wall of the chamber and having its upper part terminating adjacent the top of the casing, said frame adapted to engage the marginal lateral edges of the screen to hold the same in place, a lip hinged eccentrically to the upper end of the frame and having a heel portion to engage the screen and a cover in the top wall of the casing adapted to be closed thereon and engage the upper end of the frame to clamp the same in place and bind the heel of the lip against the upper edge of the screen and conform the latter to the frame.



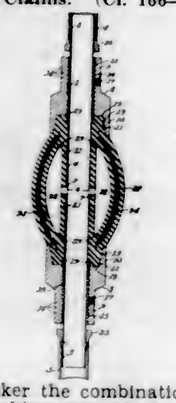
5. In a hammer mill, a main casing, a fan casing mounted on one side of the main casing, a horizontal shaft disposed axially in the main and fan casings, a hammer reel on the shaft in the main casing, a fan on the shaft in the fan casing, an inlet extending downwardly in the front side of the casing at substantially a tangent to the bottom wall thereof beneath the hammer reel, an arcuate screen extending from the rear end of the bottom wall in upright position in the rear side of the casing to receive therethrough ground material thrown off by the hammer reel for accumulation in the rear bottom portion of the casing, said casing having a collecting sump at its lower rear portion the lower wall of which extends outwardly from the screen and generally horizontally relative to the bottom wall of the casing, and a substantially horizontally disposed conduit extending from said collecting sump at said lower wall around the exterior of the main casing to said fan casing, whereby ground material tending to choke said conduit upon overloading of the main casing may gravitate along the bottom of the conduit without entirely closing the same so that the continuous draft of air may gradually absorb the overload of ground material and prevent the choking of the mill.

2,098,481
BRAKE CONTROL
Frank C. Baird, Detroit, Mich.
Application August 22, 1934, Serial No. 740,979
2 Claims. (Cl. 188—16)



1. In a vehicle having a plurality of traction wheels, individual brake mechanisms associated with each of said wheels, said brake mechanisms each comprising a drum movable with the wheel, a brake support and a shoe mounted on the support and movable to frictionally engage and disengage the drum, hydraulic mechanism operatively related to and operable to simultaneously actuate the shoes, a plurality of manually operable means each operatively related to one of said shoes, said manually operable means each consisting of a shaft rotatably mounted on said support, a spiral faced cam mounted on and operable by rotation of the shaft to operatively engage and disengage the shoe with the drum, a cable having one end connected with the shaft and operable by exerting a pull thereon to rotate the shaft and cause said cam to move the shoe into frictional contact with the drum, a handle member mounted on the other end of each cable, and means for maintaining said handle member in close proximity to the driver's seat.

2,098,482
METHOD OF AND MEANS FOR PREVENTING THE FORMATION OF SLEET ON MOBILE BODIES
Raymond I. Bashford, Philadelphia, Pa., assignor to Atlas Powder Company, Wilmington, Del., a corporation of Delaware
Application April 25, 1934, Serial No. 722,405
10 Claims. (Cl. 15—250)

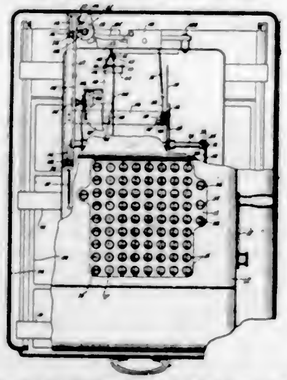


1. The process of preventing the formation of adhering ice on the windshields of vehicles by repeatedly applying to the exposed portions of such windshields the solid, water-soluble hexahydric alcohol, sorbitol.

2,098,483
PLASTER MIXER
Byron D. Bonham, Los Angeles, Calif.
Application July 7, 1936, Serial No. 89,340
9 Claims. (Cl. 83—73)

1. A mixer comprising a container mounted to swing around a horizontal axis, a revoluble shaft extending downwardly into said container, an agitator on said shaft within said container, and means for supporting and driving said shaft remote from and independent of container, said container having a side wall formed with a slot to receive said shaft on swinging said container on its horizontal axis.

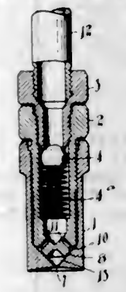
2,098,484
PACKER
William J. Brundred, William E. Crowley, and Robert B. Bossler, Oil City, Pa., assignors to Brundred Oil Corporation, Oil City, Pa., a corporation of Pennsylvania
Application April 21, 1936, Serial No. 75,574
7 Claims. (Cl. 166—10)



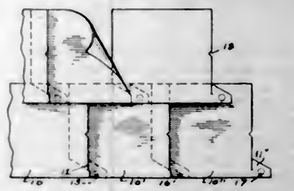
1. In a packer the combination of a stem, a chambered packing element of resilient material surrounding the stem and having its intermediate portion secured thereto, and means for inflating the chamber in said packing element causing it to expand laterally and contract axially of the stem.

2,098,485
JOIST SUPPORT
Eric Carlson, Chicago, Ill.
Application January 21, 1937, Serial No. 121,473
1 Claim. (Cl. 20—94)

A metal joist support, comprising substantially an L-shaped member, the horizontal portion of which is adapted to be received in a slot provided therefor in the narrow face of the stud, said last mentioned portion being provided with a right-angled extension adapted to contact the said narrow face of the stud and to be secured thereto, said right-angled extension being spaced from the vertical portion of said member, so as to provide a substantially square seat for the joist and means provided in said vertical portion for securing the said member to the joist.



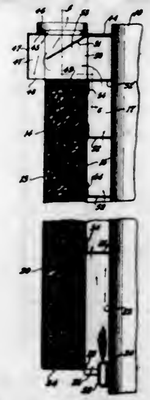
2,098,486
CASH REGISTER
Harold W. Clark, Alliance, Ohio, assignor to The McCaskey Register Company, Alliance, Ohio, a corporation of Ohio
Application March 2, 1936, Serial No. 66,620
7 Claims. (Cl. 235—22)



1. A register including an adding machine unit and a plurality of drawers associated therewith, means normally urging each drawer to open position, latch bolts normally holding each drawer in closed position, a bank of clerk or department keys, operating means for the adding machine, normally inoperative latch bolt releasing means operable by said operating means, means released by any one of said clerk or department keys for rendering said latch bolt releasing means operative, movable stop means for limiting the operation of said latch bolt releasing means, and selective means controlling the position of said stop means to selectively release a predetermined latch bolt.

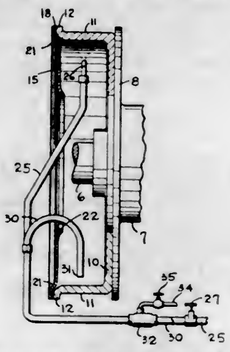
2,098,487
SPRAY NOZZLE
Edward Cooper and Thomas C. Shiels, Toronto, Ontario, Canada, assignors to Elias Rogers Co. Limited, Toronto, Ontario, Canada
Application October 12, 1936, Serial No. 105,208
2 Claims. (Cl. 299—118)

1. In a three piece spray nozzle the combination of a connection for an oil pipe having an internal valve seat; a spray conduit threaded externally on the connection; a spray casing threaded externally on the spray conduit and having a spray outlet formed in its end, the spray conduit and casing co-operating to atomize oil passing to the outlet; a coil spring housed in the spray conduit; and a ball within the spray conduit pressed by the spring and adapted to seat in the connection to cut off the flow of oil close to the nozzle when pressure of the oil supply ceases.



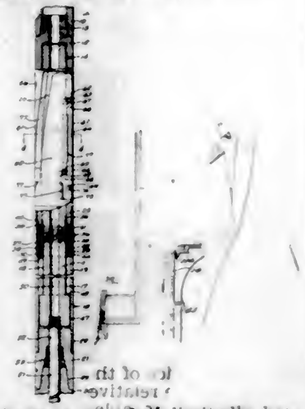
2,098,488
LOCK TYPE SHINGLE
John V. Donahue, Anderson, Ind.
Application May 31, 1930, Serial No. 458,412
4 Claims. (Cl. 108—7)

3. A roof comprising a plurality of composition shingles, each of said shingles being substantially rectangular in shape having a nail flap extending laterally from the lower right corner of the shingle, and having a notch cut out of the lower left hand corner, one of said shingles having a nail through said flap, and the next horizontally adjacent shingle having its left vertical edge above said notch inserted under the right vertical edge of the first shingle down to said flap and having the notch in the second shingle placed around the upper juncture of the flap with the first shingle to permit the butt end of the second shingle to be aligned in the same line including the butt end of the first shingle, and having a nail through the flap of the second shingle, and succeeding shingles similarly assembled one with the other to form a continuous row across the roof, and a second row of shingles overlapping the first row from above said left hand corner notch being formed to have all of the lower left corner to the left of said notch removed below the level of the bottom of said flap juncture.



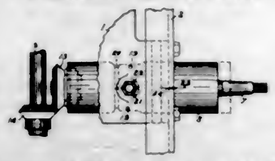
2,098,489
HOT WATER HEATER
Harry H. Everhard, Canton, Ohio
Application September 5, 1936, Serial No. 99,590
7 Claims. (Cl. 122—14)

6. A heater for a cylindrical hot water boiler, including a flexible elongated shell for fitting around the side of the boiler and forming therewith a narrow heating chamber, said shell having circumferentially adjustable top and bottom walls and a heat insulating chamber outside of said heating chamber, and a series of circumferentially adjustable baffles in the heating chamber for conforming to the curved wall of the boiler.



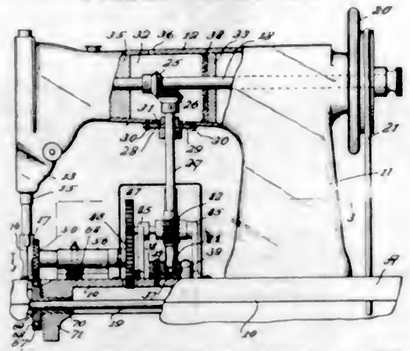
7. A heater for a hot water boiler, including a shell for fitting around the side of the boiler, said shell having walls forming an inner heating chamber and an outer heat insulating chamber, walls forming a flue passage communicating with said heating chamber and extending across and beyond said insulating chamber for communicating with the atmosphere, and a flue communicating with said flue passage.

2,098,490
WATER-COOLED BRAKE DRUM
Walter G. Fitzpatrick, Houston, and Samuel W. Webster, Dallas, Tex.
Application November 16, 1934, Serial No. 753,322
7 Claims. (Cl. 188—264)



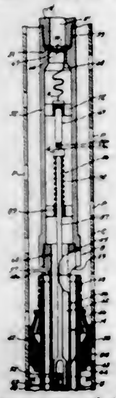
1. A water cooled braking means for hoists including a rotatable brake rim, an annular trough associated with said brake rim, a conduit to introduce water into said trough, means to direct the water from said conduit against an area extending to either side of the top centerline of said trough whereby water will drain from the top area by gravity and cool the remaining surface when the brake rim is stationary, and a suction pipe to remove water from said trough, said pipe being positioned to limit the quantity of water in said trough to less than the static liquid capacity of said trough.

2,098,491
ROTARY JAR
Walter L. Foster, Whittier, and James J. Santiago, Los Angeles, Calif., assignors to John Grant, Los Angeles, Calif.
Application July 6, 1936, Serial No. 88,916
3 Claims. (Cl. 255—27)



1. In a jar, a body, a mandrel limitedly longitudinally movable and limitedly rotatable in said body, striking shoulders on the mandrel and body and which are brought into engagement by relative longitudinal movement of the mandrel in one direction, said body and mandrel having interengaging transverse shoulders and a longitudinal bearing surface, which shoulders are adapted to be moved out of interengagement by relative rotation of the body and mandrel in one direction, to allow relative longitudinal movement in the stated direction, and which longitudinal bearing surface maintains contact between the body and mandrel during such longitudinal movement, a spring tending to relatively rotate the body and mandrel opposite to the direction which causes shoulder disengagement, and interengaging cam faces on the body and mandrel acting positively to rotate the body and mandrel relatively in said last mentioned direction by virtue of their relative longitudinal movement in the direction opposite to that first stated.

2,098,492
PULLEY ATTACHMENT FOR TRACTORS
Conrad E. Frudden, Wauwatosa, Wis., assignor to Allis-Chalmers Manufacturing Company, Milwaukee, Wis., a corporation of Delaware
Original application June 13, 1935, Serial No. 26,352. Divided and this application August 3, 1936, Serial No. 94,016
9 Claims. (Cl. 74—400)

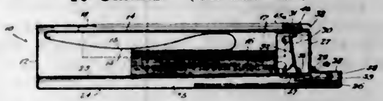


1. In a motor vehicle, a housing, a rotary power shaft within said housing, a sleeve having a series of helically arranged tapered holes in it and being mounted in said housing for rotary and longitudinal sliding movement on an axis angularly disposed relative to the axis of said power shaft, a pulley shaft extending through said sleeve and rotatably mounted therein in axially fixed position, bevel gears secured to said power shaft and pulley shaft for transmitting rotary movement from said power shaft to said pulley shaft, and a set screw on said housing having a tapered end adapted to be wedged into any selected hole of said series for positively locking said sleeve in a plurality of axially adjusted positions affording slightly different depths of mesh of said bevel gears.

2,098,493
TRIMMING MECHANISM ATTACHMENT
William P. Gearty, Chicago, Ill., assignor to Maurice Smoler, Chicago, Ill.
Application April 17, 1935, Serial No. 16,764
6 Claims. (Cl. 112—124)

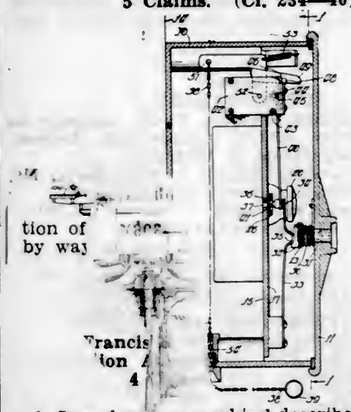
1. In a sewing machine having a stitching mechanism and driving means for operating it including a shaft, the combination of a rotary cutter, a shaft for said cutter, a vertical shaft connected with said first mentioned shaft and with the cutter shaft for rotating the cutter, a hook carrying shaft, and a freely rotatable annular ring member surrounding said hook shaft and co-operating with the rotary cutter.

2,098,494
APPARATUS FOR CLEANING WELLS
John Grant, Los Angeles, Calif.
Application July 20, 1935, Serial No. 32,401
20 Claims. (Cl. 166—19)



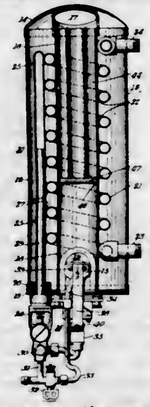
1. In oil well apparatus of the character described, means forming a normally closed low pressure chamber, said means including a wall containing a well fluid inlet opening, an inlet closure applied directly to said wall and across said opening, and explosive means adapted to be fired to open said closure for the entry of a well fluid charge to the chamber.

2,098,495
MECHANICAL MALLET
Harry Daniel Greenberg, New York, N. Y., assignor to Industrial Hammer Development Corporation, a corporation of New York
Application February 10, 1934, Serial No. 710,753
13 Claims. (Cl. 125—33)



1. In a mechanical mallet, the combination of a casing, a rotatable shaft therein having a screw thread thereon ending in a blind thread, a mallet head having a part thereon for engagement with said screw thread, a latch and a latch-operating part mounted on said mallet head and adapted to catch said part when it is thrown out of engagement with said screw thread, a spring adapted to throw said mallet head when said part is held by said latch, a tool holder in said casing which is adapted to receive the blow of said hammer head, and means for so adjusting said tool holder as to permit said hammer head to descend so low that its said thread-engaging part shall be below the range of engagement of said thread and means whereby said hammer head may be raised sufficiently so that said part shall engage said screw thread.

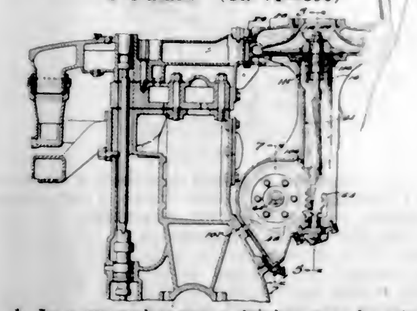
2,098,496
MANIFOLDING MACHINE
Arthur A. Johnson, Bridgeport, Conn., assignor to Autographic Register Company, Hoboken, N. J., a corporation of New Jersey
Application January 31, 1935, Serial No. 4,265
10 Claims. (Cl. 282—21)



5. A manifolding machine having a box-like casing, a platen over which a plurality of continuous worksheet strips may be advanced, and a tearing edge along which the strips are severed; means including a pair of pins for engaging apertures in the worksheet strips at form-length intervals; a hinged plate on which said pins are mounted to be moved toward and from the front end of the machine; and a manually operated cam slide movable transversely of the machine for controlling the movements of the hinged plate forwardly and backwardly of the machine.

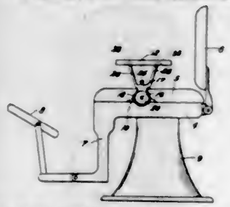
2,098,497
WATCHMAN'S TIME RECORDER
Austin C. Johnson and Theodore M. Wrobie, Chicago, Ill.
Application August 14, 1936, Serial No. 96,001
5 Claims. (Cl. 234—40)

1. In a device of the kind described, a frame, a sheet movable relative to the frame, a bar, means providing a movable pivot connecting the bar with the frame, a punch mounted on the bar normally out of engagement with the sheet and movable beyond its normal position towards the sheet, a stop member mounted on the frame adjacent the movable pivot and providing a fulcrum for the bar as the pivot is moved, mechanism operable to rotate the bar about said movable pivot to move the punch away from the sheet and the bar away from said stop member and then to operatively disengage the bar, means for manually actuating said mechanism, and resilient means adapted to snap the disengaged bar back to normal position in contact with said stop member, the momentum resulting from said return movement of the punch and bar carrying the punch beyond its normal position into momentary punching engagement with said sheet.



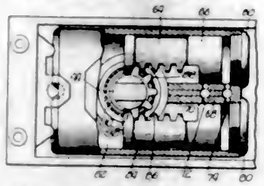
2,098,498
FLUID HEATER
Chester D. Jones, Carnegie, Pa., assignor to The Pittsburg Water Heater Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application February 6, 1936, Serial No. 62,668
2 Claims. (Cl. 236—33)

1. In a liquid heater, the combination of a



coil through which the liquid passes as it is being heated, a tubular sheath isolated from the liquid and fixed to a plurality of turns of the coil for direct heat conduction to said sheath throughout the heat absorption length thereof, and a thermostatic element within the sheath and arranged to control the application of heat to the coil.

2,098,499
SUPERCHARGER
Floyd F. Kishline, Detroit, Mich., assignor to Graham-Paige Motors Corporation, Detroit, Mich., a corporation of Michigan
Original application August 7, 1935, Serial No. 35,022. Divided and this application May 11, 1936, Serial No. 58,626
4 Claims. (Cl. 74—396)



1. In a supercharger, a driving gear housing, a cover plate detachably secured to said housing, a drive shaft journalled in said housing and cover plate, a driving gear on said shaft, and a worm for meshing with said gear, the drive shaft bearing in said gear housing being removable and of sufficient wall thickness whereby said driving gear may be placed into and out of mesh with its worm by tilting or moving the drive shaft toward and away from said worm respectively when said bearing is removed and said cover plate is not secured to the housing.

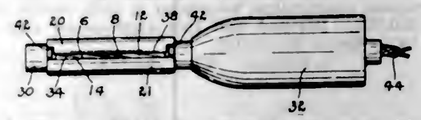
2,098,500
TREATMENT CHAIR
Frank Koenigkramer and Frederick Koenigkramer, Cincinnati, Ohio
Application March 26, 1936, Serial No. 70,998
3 Claims. (Cl. 155—198)

1. In an arm-rest for a chair of the class described, the combination of a bracket for attachment to the chair, said bracket including an upstanding portion shaped to provide a peripheral curved track of full circle extent, and a friction track adjacent and substantially at right angles to the peripheral curved track, the latter having a vertical notch formed therein, an arm-rest including an enlarged end with a friction track complementary to the first-mentioned friction track, said end being cupped to receive the peripheral curved track of the bracket, and pivoted upon the bracket with the cupped portion thereof concentric to the peripheral curved track of the bracket, and a retractable latch bolt reciprocably mounted upon the arm-rest and having a free end, a spring engaging the bolt to urge said free end constantly against the peripheral curved track of the bracket in all positions of pivotal movement of the arm-rest, said free end being proportioned to enter the notch of the peripheral curved track in one position of the arm-rest.

2,098,501
DOOR CLOSING AND CHECKING DEVICE
David R. Lasier, Chicago, Ill., assignor to Norton-Lasier Company, Chicago, Ill., a corporation of Illinois
Application February 19, 1934, Serial No. 711,909
14 Claims. (Cl. 16—55)

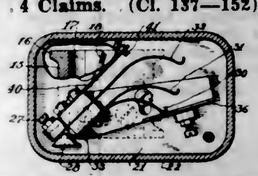
1. Door checking mechanism for a double swinging door comprising a double cylinder containing a checking fluid, a pair of pistons therein, a spindle adapted to be operatively connected to the door and with said pistons and means for moving either of said pistons through a portion only of the door swinging movement according to whether the door is moved in one or the other direction from the closed position thereof.

2,098,502
INNER-SOLE
Robert M. Lehner, Lynn, Mass.
Application November 29, 1935, Serial No. 52,078
5 Claims. (Cl. 36—43)



1. An inner-sole made of a single piece of paper material, said material being stiffened by treatment at its heel and toe extremities and forming thereby stiff heel and toe portions and unstiffened center portions of the original paper material providing a flexible center section therebetween, said flexible section having the surface thereof cut lengthwise and crosswise by parallel cuts spaced closely together and extending only for a slight depth into the material whereby said center section is more flexible than the original paper and said extremities more rigid.

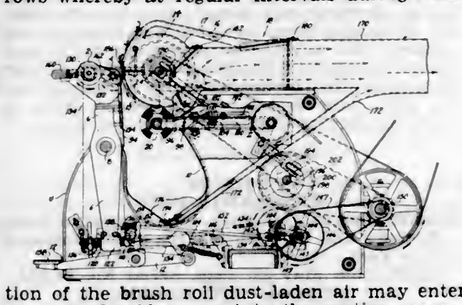
2,098,503
METHOD OF INCORPORATING METALLIC DRIERS IN DRYING OIL ALKYD-NITROCELLULOSE BLENDS
William R. Marshall, Upper Darby, Pa., assignor to The Resinous Products & Chemical Company, Philadelphia, Pa.
No Drawing. Application December 22, 1936, Serial No. 117,145
5 Claims. (Cl. 134—26)



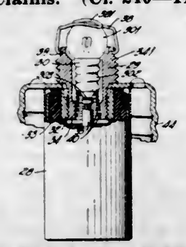
1. In the process of manufacturing quick-drying lacquers from drying-oil alkyd resins and cellulose nitrate, the steps which comprise adding a metallic drier which is a member of the group consisting of cobalt and manganese driers to a solution of a drying-oil alkyd resin and allowing it to stand at least eight hours before mixing with a cellulose nitrate solution.

2,098,504
MOTOR DRIVEN RAZOR
August Mattson, John I. Smith, and Erick Frans, Algona, Wash.
Application August 31, 1935, Serial No. 38,818
2 Claims. (Cl. 30—43)

1. The combination with a rotary razor blade having end journals, of a housing having diametrically opposed longitudinal openings and comprising longitudinal sections, each said section having an outwardly bent free edge along an opening, said edge being adapted for marginal contact with the blade, bearings on the housing for said journals, and detachable means for securing said bearings about the journals.



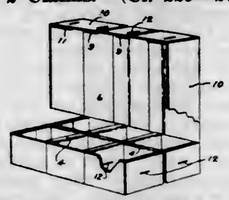
2,098,505
GOVERNOR
Neel M. McCullough and Calvin C. Cook, Anderson, Ind., assignors to Pierce Governor Company, Anderson, Ind., a corporation of Indiana
Application March 2, 1934, Serial No. 713,680
4 Claims. (Cl. 137—152)



1. A spring structure for controlling movement of the throttle valve in a speed-governor of the velocity type, comprising a saddle adapted for attachment to the shaft of said valve, a leaf spring secured to said saddle and extending generally radially therefrom, an arm secured to said saddle and extending in spaced relation to said spring, and an adjustable abutment carried by said arm and adjustable toward and away from said spring.

2,098,506
BUFFING MACHINE
George E. McLaughlin, Salem, and Winn E. Broughton, Peabody, Mass., assignors to The Turner Tanning Machinery Company, Portland, Maine, a corporation of Maine
Original application June 5, 1936, Serial No. 83,718. Divided and this application January 12, 1937, Serial No. 120,286
8 Claims. (Cl. 51—78)

1. In a buffing machine, a driven cylindrical roll having an abrasive surface to effect buffing of a surface of a piece of leather, a suction device having an opening adjacent to the abrasive surface of the cylindrical roll to carry away dust-laden air, and a brush roll located in front of the opening into said suction device and in position to brush lightly the surface of the abrasive roll, said brush roll having its bristles in rows alternating with relatively wide spaces between the rows whereby at regular intervals during rotation of the brush roll dust-laden air may enter by way of said spaces into the suction means.

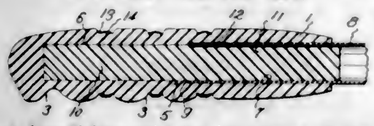


2,098,507
FLASH LAMP
Francis R. Meginniss, Albany, N. Y.
Application August 14, 1935, Serial No. 36,097
4 Claims. (Cl. 240—11.3)

1. In a portable electric light, a socket, an electric lamp provided with a base receivable in said socket, yielding means located in said socket and engageable with said base for ejecting said lamp from said socket, means engageable with the bulb of said lamp for normally retaining the same in operative position in said socket, the base of said lamp being provided with a fixed contact thereon, a second contact fixed relatively to said lamp and engageable with said contact on said base, and means whereby said normally fixed contact may be adjustably positioned along said socket to fixed positions whereby lamps of variable over-all lengths may be used without substantially varying the pressure exerted by the lamp engaging means on said bulb.

2,098,508
CARDBOARD BOX
Edmund L. Moore, Springfield, Mass.
Application September 24, 1935, Serial No. 41,850
2 Claims. (Cl. 229—27)

1. A one piece box blank for forming a multi-compartment box by folding of the blank which comprises sections forming the bottoms of the compartments, sections forming the side walls of the compartments and sections forming a



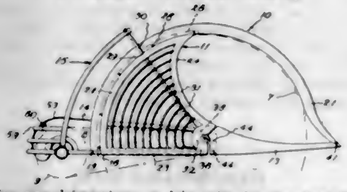
cover, the blank being scored at the union of said sections, the adjacent side wall sections of adjacent compartments being united to each other, and the blank being scored at the union of said adjacent side wall sections, whereby the several compartments of the set up box are separated from each other by double walled partitions, and the said cover sections overlap each other to form reenforcing ribs across the box cover.

2,098,509
HANDLEBAR GRIP

John R. Morgan, Oak Park, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York

Application May 23, 1936, Serial No. 81,391

2 Claims. (Cl. 208—126)



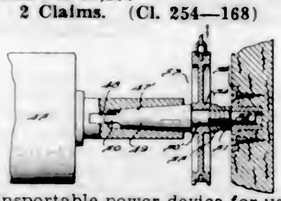
2. A handlebar grip for bicycles and the like which comprises a barrel member formed of a flexible rubber compound and having a bore extending from one end to a point adjacent the other end, a core member formed of flexible rubber compound, one end of said core making a compressed fit in the closed end portion of said bore, the portion of the bore adjacent the open end being enlarged to form with the core an annular recess in which the end of the handlebar may be inserted by a stress imposing distortion of the barrel and core, the outer surface of the barrel being provided with one or more spaced circumferential grooves and bands of metal surrounding the barrel at the bottom of said grooves.

2,098,510
WHEEL AND CHAIN GUARD FOR BICYCLES

John R. Morgan, Oak Park, Ill., assignor to Sears, Roebuck and Co., Chicago, Ill., a corporation of New York

Application May 23, 1936, Serial No. 81,392

3 Claims. (Cl. 280—152.2)



3. In combination, a bicycle frame having the rear ends of the rear fork members at each side integrally connected to vertical plate members, an arcuate mudguard having its forward end secured to the horizontal portion of the rear fork and extending around the upper portion of the rear wheel in substantially concentric relation thereto, the rear end portion of the mudguard being extended downwardly to the level of the horizontal members of the rear fork, generally triangular skirt guards positioned on opposite sides of the rear wheel, each of said skirt guards being integrally formed of sheet metal and having an arcuate edge portion rigidly secured over substantially its entire length to the adjacent edge of the forward portion of the mudguard, the skirt guards being positioned outwardly of the rear fork members and extending to the horizontal fork member of the frame, the rear end portions of the skirt guards being rigidly secured to the adjacent vertical plate member of the rear fork, tail pieces rigidly connecting the rear end of the mudguard to the vertical plates, and a flanged sprocket guard connected at its forward end portion to the frame of the bicycle and having its rear edge secured to the forward edge of the adjacent skirt guard.

2,098,511
HOISTING DEVICE

Sulo M. Nampa, Detroit, Mich., assignor to The Worth Company, a corporation of Michigan

Original application November 2, 1932, Serial No. 640,798. Divided and this application July 6, 1936, Serial No. 89,107

2 Claims. (Cl. 254—168)

1. A transportable power device for use in conjunction with freight car loading devices comprising a motor, a shaft driven by the motor, a power sheave on the shaft, and pilot means on the end of the shaft beyond the sheave and adapted to cooperate with a stationary pilot means for anchoring the device during use.

2,098,512
EYEGLASS CONSTRUCTION

George E. Nerney, Attleboro, Mass., assignor to Bay State Optical Company, Attleboro, Mass., a corporation of Maine

Application August 1, 1933, Serial No. 683,135

4 Claims. (Cl. 88—53)

1. In eyeglass construction, in combination, a lens, lens retaining means secured to said lens including a flat portion following and adjacent to the edge of said lens, said flat portion being wider than the edge of said lens, a lug extending from said flat portion in a substantially horizontal direction, a part fitting over said lug, a member pivotally connecting said lug and said part, and a temple bow curving inwardly toward the edge of said lens and connected to the outer side of said part, said part including a flat vertical inner surface substantially equal in extent to said flat portion, said flat surface running in a direction to be in substantially complete engagement with said flat portion when said temple is in its unfolded position to limit the unfolding movement of said temple.

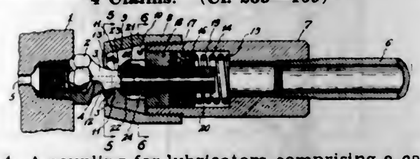
2,098,513
EYEGLASS CONSTRUCTION

George E. Nerney, Attleboro, Mass., assignor to Bay State Optical Company, Attleboro, Mass., a corporation of Maine

Application January 4, 1934, Serial No. 705,174

9 Claims. (Cl. 88—45)

7. An ophthalmic mounting comprising a pair of lens holding devices, a closed loop member secured to each of said devices, and a substantially flat straight spring which passes through the loop members and has its respective ends soldered



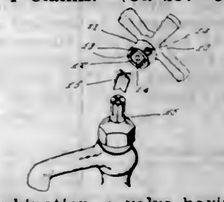
to the devices at points spaced from the loop members.

2,098,514
COUPLING FOR LUBRICATORS

Walter G. Nord, Amherst, Ohio, assignor, by mesne assignments, to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia

Application October 27, 1931, Serial No. 571,445

4 Claims. (Cl. 285—169)



4. A coupling for lubricators comprising a casing; cooperating jaws movably mounted at one end of said casing and forming a nipple-receiving opening; a piston slidable in said casing and adapted to move said jaws into clamping position; resilient means urging said piston to move said jaws; a plunger slidable in said piston and having one end near the inner end of said opening; a sealing member carried by said plunger end; and resilient means urging said plunger toward the inner end of said opening, said piston being between the said two resilient means and compounding the resilient action thereof.

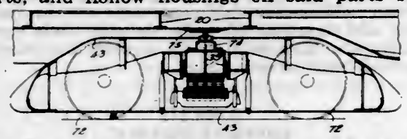
2,098,515
VALVE HANDLE

Frank J. Pardieck, Indianapolis, Ind.

Application November 18, 1935, Serial No. 50,297

4 Claims. (Cl. 287—53)

1. In combination, a valve having a rotatable valve-stem provided in its end with two longitudinally extending slots, a cruciform keying element disposed in said slots, a handle having a central recess provided with longitudinally extending grooves adapted to receive the edges of said cruciform element, and one or more setscrews mounted in said handle in position to engage said valve-stem between adjacent slots therein.



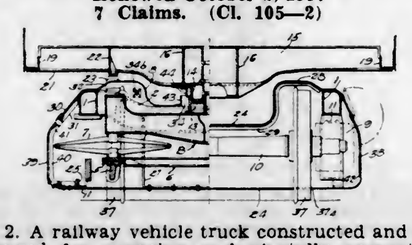
2,098,516
RAILWAY CAR CONSTRUCTION

Harry M. Pflager, St. Louis, Mo., assignor to General Steel Castings Corporation, Granite City, Ill., a corporation of Delaware

Application March 29, 1934, Serial No. 717,920

9 Claims. (Cl. 105—2)

2. In a railway vehicle, underconstruction including body underframing parts and truck parts, center bearing connections between said parts, members enclosing the adjacent portions of said parts, and hollow housings on said parts surrounding said connections, said members and housings cooperating to form streamline structure for reducing air resistance to movement of the vehicle.



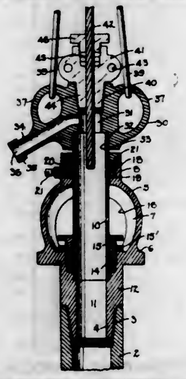
2,098,517
RAILWAY TRUCK STRUCTURE

Harry M. Pflager, St. Louis, Mo., assignor to General Steel Castings Corporation, Granite City, Ill., a corporation of Delaware

Application March 29, 1934, Serial No. 717,921

Renewed October 2, 1937

7 Claims. (Cl. 105—2)

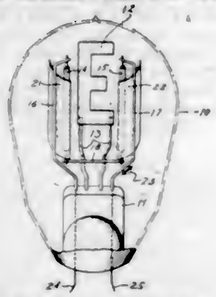


2. A railway vehicle truck constructed and arranged for engaging and pivotally supporting the vehicle body and having streamlined top cover structure independent of the vehicle body and closely following the adjacent contour of the truck, portions of said structure intermediate the sides of the truck being substantially depressed lengthwise of the truck in comparison with the side portions thereof to accommodate irregularities in the under surface of the supported vehicle body underframe.

2,098,518
WIRE LINE SWIVEL

Felix L. Pivoto, Liberty, Tex.

Application November 4, 1935, Serial No. 48,201

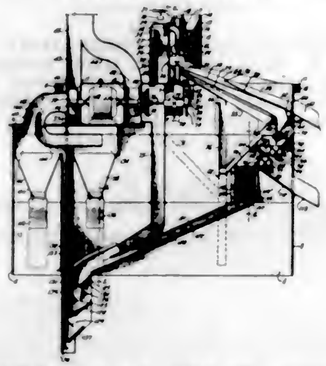


3 Claims. (Cl. 255—25)

1. A swivel for use in well drilling operations to support the drill pipe and adapted to accommodate wire line operated tools therein comprising a body, a spindle therein, bearings supporting said

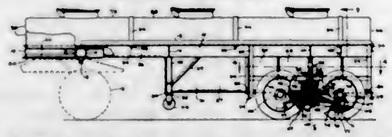
body on said spindle, means to support said spindle, a vertical passage through said spindle, a head thereon having a passage in alignment with said spindle passage and a plug normally closing said passage but removable for the insertion and removal of tools through said swivel which are manipulated by a wire line passing through said swivel.

2,098,519
DISPLAY DEVICE
Samuel Ruben, New Rochelle, N. Y., assignor to Sirian Lamp Company, Newark, N. J., a corporation of Delaware
Application August 23, 1930, Serial No. 477,301
Renewed September 26, 1936
8 Claims. (Cl. 176—14)



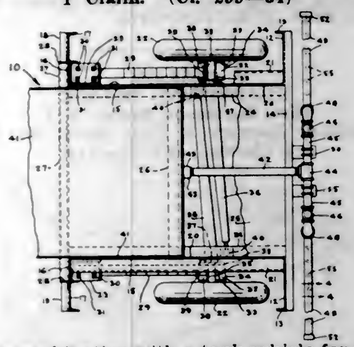
1. In a gas glow lamp an electron emitting element, means to connect said element in a circuit so that current is caused to flow through said element, an ionizable gas surrounding said element and having a pressure such that the visible ionization of said gas is confined to the region of said element when said element is energized, a member adapted to be illuminated, means to direct the light from said element upon said member, and a sealed envelope enclosing said gas and member.

2,098,520
WELL CLEANING DEVICE
James J. Santiago, Los Angeles, Calif., assignor to John Grant, Los Angeles, Calif.
Application May 20, 1935, Serial No. 22,297
23 Claims. (Cl. 166—19)



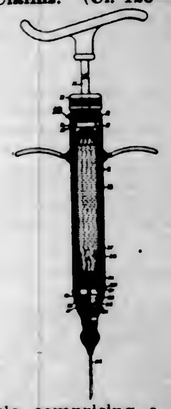
1. In a well cleaning device, a body forming a low pressure chamber, normally closed means adapted to be opened to admit well liquid to said chamber, a member movable relative to said body from retracted to projected position to open the first mentioned means, means for releasably holding said member in retracted position, and a suspension means on which said body is lowered into the well, said member being movable from non-retracted position to retracted position and into retained but releasable engagement with said holding means after said body has been lowered in the well.

2,098,521
APPARATUS FOR PROCESSING GRAIN
William A. Seymour, Leavenworth, Kans.
Application July 3, 1933, Serial No. 678,884
3 Claims. (Cl. 83—35)



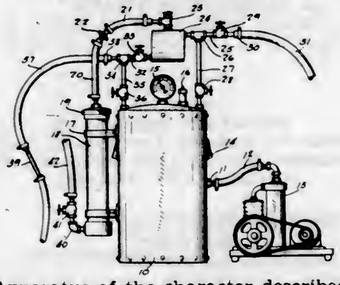
1. Apparatus of the character described including a support for a travelling stream of grain, a vibrator adapted for delivering grain onto said support, means for inducing a stream of air over the support in the direction of travel of the grain stream, means for confining the air stream in tangential pressing contact with said grain stream to effect rolling action of the grain particles in response to thrust of said particles against the support by the air stream and propulsion of said particles in response to said tangential contact of the air stream with said particles.

2,098,522
TANK VEHICLE
Roy B. Simning, Minneapolis, Minn., assignor, by mesne assignments, to himself and Harold J. Murphy, St. Louis Park, Minneapolis, Minn., and George Verne Watson, Minneapolis, Minn.
Application December 13, 1935, Serial No. 54,277
17 Claims. (Cl. 280—5)



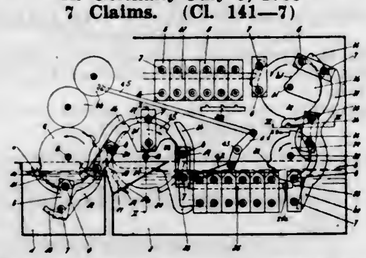
5. A tank vehicle comprising a vehicle frame including spaced apart, longitudinally extending girder members at opposite sides of said frame and means integrally connecting said girder members to each other, wheel housings integral with the girder members and extending downwardly and inwardly therefrom, wheels and mounting means therefor at the opposite sides of the vehicle and at the outer sides of said wheel housings, said mounting means being connected to said wheel housings, and a tank for material spanning the space between said girder members and extending therebelow, said tank being supported by said frame, and a lower portion of the tank spanning the space between and being fitted to said wheel housings.

2,098,523
SPRAY DEVICE
Roy B. Simning, Minneapolis, Minn., assignor, by mesne assignments, to himself and Harold J. Murphy, St. Louis Park, Minneapolis, Minn., and George Verne Watson, Minneapolis, Minn.
Application April 16, 1936, Serial No. 74,652
1 Claim. (Cl. 299—34)



The combination with a tank vehicle for transporting a liquid, of a horizontally disposed spray device mounted on said vehicle to extend transversely thereof and associated with the tank of the vehicle as a medium for applying liquid to a highway, said spray device being constituted as a hollow bar having equally spaced nozzle outlets in its lower portion and arranged vertically and in longitudinal alinement along the length of the spray bar, each nozzle outlet including means for spraying liquid in a stream of approximately uniform thickness diverging downwardly in direction transversely of the vehicle and longitudinally of the spray device, and said nozzle outlets having such relation to each other and to the earth's surface that adjacent divergent streams emitted from the several nozzle outlets will slightly overlap, and means constituted as a mounting for said vehicle for precluding sidewise swaying of the vehicle and for substantially constantly maintaining the spray device in parallel relation to the surface of a highway while the vehicle is traveling over said highway.

2,098,524
SYRINGE
Arthur E. Smith, Los Angeles, Calif.
Application April 3, 1935, Serial No. 14,499
4 Claims. (Cl. 128—218)

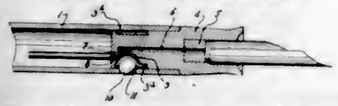


1. An ampule comprising a cylindrical body having a movable closure at one end, a fixed closure at the other end, one of said closures including a resilient body having a peripheral wall engaging said ampule and having a chamber therein, a depressible protuberance on said closure outwardly of said chamber and in alignment therewith, a preparation in said chamber, and a disk forming the outer wall of said chamber, said disk being resiliently engaged by said closure whereby when the protuberance is depressed the disk is freed.

2,098,525
BEER PIPE CLEANING APPARATUS
Clarence C. Smith, Atlantic City, N. J.
Application October 8, 1935, Serial No. 43,996
3 Claims. (Cl. 225—12)

1. Apparatus of the character described, comprising an air reservoir, means for supplying air under pressure to the reservoir, a line adapted to be connected at one end to a source of water supply and at the other end to a coil to be cleaned, a pair of conduits extending from the reservoir to the line, means for controlling the flow of air through said conduits, and a tubular member extending from said line at a point intermediate the conduits and including a valve.

2,098,526
MACHINE FOR CLEANING VESSELS, PARTICULARLY BOTTLES
Friedrich Stegemann, Bad Kreuznach, Germany, assignor to Seitz-Werke G. m. b. H., Bad Kreuznach, Germany, a corporation
Application October 7, 1936, Serial No. 104,565
In Germany July 5, 1933
7 Claims. (Cl. 141—7)



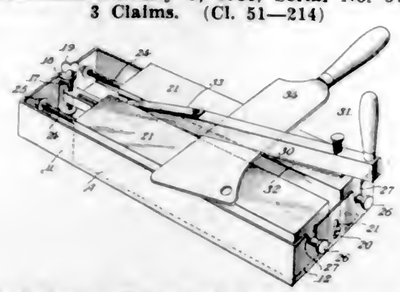
1. In a machine for cleaning vessels, a plurality of baskets each accommodating a plurality of said vessels, said baskets having upper and lower pairs of lateral projections, two pairs of rotatably mounted adjacent basket carrying wheels, each of said pairs of wheels having means for engaging both pairs of projections of the baskets, means for guiding the upper ends of the baskets from one pair of carrying wheels to the next pair of carrying wheels, the baskets being so fed by action of the one pair of rotating carrying wheels on the lower pair of projections of the baskets.

2,098,527
METHOD OF CLEANING FIBROUS MATERIALS
Kurt Stickdorn, Rossiau/Anhalt, Germany, assignor, by mesne assignments, to "Unichem" Chemikalien Handels A.-G., Zurich, Switzerland, a corporation of Switzerland
No Drawing. Application October 28, 1932, Serial No. 640,014. In Germany October 28, 1931
6 Claims. (Cl. 87—5)

1. The method of cleaning fibrous material which consists of washing the same in an aqueous bath containing as a wetting-out and cleaning agent material of the group consisting of soap-forming fatty acid, sulfonated lauryl alcohol and Turkey-red oil neutralized by material of the group consisting of cyclohexylamine, cyclopentylamine and methylcyclohexylamine.

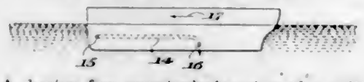
6. A cleaning composition comprising as principal ingredients cyclohexylamine and water soluble soap.

2,098,528
FOUNTAIN PEN VALVE
Anatol N. Andrews, Los Angeles, Calif.
Application May 23, 1936, Serial No. 81,453
1 Claim. (Cl. 120—48)



In a fountain pen a sacless shut off valve which is independent, separated and sealed from pen ink container, and includes in combination a tubular band of soft, flexible, stretching and springy material mounted over the middle section of feed channel walls and a valve seat, and the band is not extended into the ink container, and is not a part thereof,—and a valve seat mounted in the feed channel and separated from the ink container by the upper section of the feed channel and walls thereof,—and a press button mounted in an opening in the lower section of the pen over the tubular band and the valve seat,—and the opening and the press button are insulated and sealed from the ink and the ink container by the tubular band and walls of the feed channel.

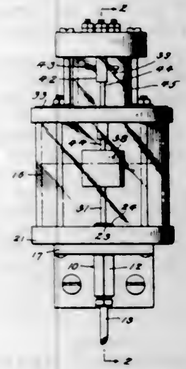
2,098,529
METHOD AND APPARATUS FOR CHARGING BLASTING CARTRIDGES
Frank H. Armstrong, Chicago, Ill., assignor to Safety Mining Company, Chicago, Ill., a corporation
Application March 16, 1936, Serial No. 69,209
9 Claims. (Cl. 102—5)



1. A portable blasting cartridge charger comprising a wheeled truck, a liquid receptacle mounted on the truck, a plurality of receivers connected in series and positioned within the receptacle, means for connecting the series of receivers to a source of compressed gas to charge the receivers to a pressure at least equal to the desired charging pressure of the cartridges and for connecting the receivers to the cartridges to be charged, and means mounted on the truck for forcing liquid from the receptacle into the series of receivers as cartridges are charged with compressed gas therefrom to maintain the gas remaining in the receivers at the desired charging pressure of the cartridges.

2,098,530
SHARPENING DEVICE
Silvio Battocchi, Bronx, N. Y.
Application January 3, 1936, Serial No. 57,430
3 Claims. (Cl. 51—214)

1. A device of the kind described, comprising a container, sharpening elements arranged within said container, a carriage slidable between the elements, a swinging work holder mounted on the carriage, and a vertically adjustable track for the carriage.



2,098,531
STABILIZATION OF SHIPS
William Lawrence Bazé, Paris, France
Application May 21, 1934, Serial No. 726,861
In France May 27, 1933
2 Claims. (Cl. 114—122)

1. A device for counterbalancing the rolling of a ship comprising two stabilizers symmetrically placed on the sides of the ship, each stabilizer consisting of a tube opening under the water at the bow of the ship in a direction parallel to the direction in which the ship is sailing and ending in an outlet the axis of which is located on the widest part of the ship in a plane substantially perpendicular to the direction in which the ship is sailing, this axis being furthermore inclined downwardly below the horizontal and passing close to the hull as far as possible from the axis of oscillation of the boat and each stabilizer being provided with a suitable valve, means for alternately actuating said valves so that one of the tubes is open while the other is closed, this alternation following the motion of the ship in order to give the proper direction to the stabilizing couple created.

2,098,532
FIRE ALARM-ACTUATING MEANS
Roman Blace Bukolt, Stevens Point, Wis.
Application August 13, 1936, Serial No. 95,922
4 Claims. (Cl. 200—82)

1. In a fire alarm apparatus, a reservoir, a liquid-containing line, communicating means between said line and reservoir, an alarm-operating member operatively associated with said communicating means and biased against operation except under impact of a rapid surge of liquid through said communicating means caused by abnormal expansion of the liquid in said line, said reservoir being of sufficient capacity to hold all liquid flowing thereto from said line to save said liquid for return through said communicating means to said line, said communicating means being connected with said reservoir at such a point as to be sealed by the liquid in said reservoir, preventing air from entering said line, the whole providing an automatic liquid-surged-actuated alarm apparatus which is self-conditioning for further operation unless injured in the preceding operation.

2,098,533
METHOD OR PROCESS OF TREATING PAPER
Herman Carew, Easton, Pa., assignor, by mesne assignments, to Dixie-Vortex Company, Chicago, Ill., a corporation of Delaware
No Drawing. Application May 8, 1934, Serial No. 724,615
3 Claims. (Cl. 91—70)

1. The method or process of treating receptacles or containers made of paper or similar material which consists in initially applying high temperature paraffin or similar material at the point of manufacture of the receptacle and then applying a coating of low temperature paraffin or similar material aften shipment to the point of use and just prior to filling, said last application acting to sterilize the receptacle or container just prior to use.

2,098,534
MOISTUREPROOF ARTICLE
William Hale Charch, Buffalo, N. Y., and Merlin Martin Brubaker and Frederick M. Meigs, Wilmington, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 21, 1934, Serial No. 758,652
9 Claims. (Cl. 91—68)

1. An article of manufacture having a continuous unbroken moistureproof surface comprising a film-forming substance and a solid alcohol having a melting point of at least 37° C. as the moistureproofing agent, said alcohol being selected from the group which consists of diheptadecyl carbinol and methyl phenyl octadecyl carbinol and present in an amount to impart moistureproofness to said article.

2,098,535
MOISTUREPROOF ARTICLE
William Hale Charch, Buffalo, N. Y., and Merlin Martin Brubaker and Frederick M. Meigs, Wilmington, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 21, 1934, Serial No. 758,654
14 Claims. (Cl. 91—68)

1. An article of manufacture having a continuous unbroken moistureproof surface comprising a film-forming substance and a solid organic ether as the moistureproofing agent, said ether having a melting point of at least 37° C. and being a mono-ether containing no modifying groups in the molecule and having at least 18 hydrocarbon carbon atoms for the ether-oxygen group, said ether being present in an amount to impart moistureproofness to said surface.

2,098,536
MOISTUREPROOF ARTICLE
William Hale Charch, Buffalo, N. Y., and Merlin Martin Brubaker and Frederick M. Meigs, Wilmington, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 21, 1934, Serial No. 758,655
19 Claims. (Cl. 91—68)

1. An article of manufacture having a continuous unbroken moistureproof surface comprising a film-forming substance and a solid organic polyether having a melting point of at least 37° C. as the moistureproofing agent, said polyether containing no modifying groups in the molecule and being selected from the class which consists of (1) diethers having at least 11 hydrocarbon carbon atoms for each oxygen-ether group, (2) triethers having at least 8 hydrocarbon carbon atoms for each oxygen-ether group, and (3) ethers containing more than 3 oxygen-ether groups and having at least 5 hydrocarbon carbon atoms for each oxygen-ether group, said ether being present in an amount to impart moistureproofness to the article.

2,098,537
MOISTUREPROOF ARTICLE
William Hale Charch, Buffalo, N. Y., and Merlin Martin Brubaker and Frederick M. Meigs, Wilmington, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 21, 1934, Serial No. 758,656
10 Claims. (Cl. 91—68)

4. An article of manufacture comprising a transparent, flexible, non-fibrous base sheet or film having an unbroken continuous transparent moistureproof flexible non-tacky coating comprising a film-forming substance, a solid organic ketone having a melting point of at least 37° C. as the moistureproofing agent and a blending agent, said ketone containing no modifying groups in the molecule and having at least 20 hydrocarbon

carbon atoms for the carbonyl group and being present in an amount to impart moistureproofness to said article.

2,098,538
MOISTUREPROOF ARTICLE
William Hale Charch, Buffalo, N. Y., and Merlin Martin Brubaker and Frederick M. Meigs, Wilmington, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 21, 1934, Serial No. 758,657
11 Claims. (Cl. 91—68)

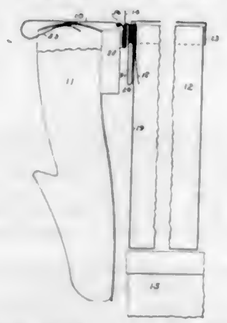
1. An article of manufacture comprising a continuous moistureproof unbroken solid film comprising a film-forming substance and an n-aryl substituted amide having a melting point of at least 37° C. as the moistureproofing agent, said amide containing no modifying groups in the molecule, having at least 17 hydrocarbon carbon atoms for the CON group and being present in an amount to impart moistureproofness to the article.

2,098,539
MOISTUREPROOF ARTICLE
William Hale Charch, Buffalo, N. Y., and Merlin Martin Brubaker and Frederick M. Meigs, Wilmington, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 21, 1934, Serial No. 758,658
19 Claims. (Cl. 91—70)

13. An article of manufacture comprising a transparent regenerated cellulose base sheet or film having a continuous unbroken transparent moistureproof coating comprising a film-forming substance and an organic halogen compound having a melting point of at least 37° C. as the moistureproofing agent, said organic halogen compound containing no modifying groups in the molecule and being selected from the class which consists of (1) mono-halides containing at least 18 hydrocarbon carbon atoms for the halogen group, (2) di-halides containing at least 10 hydrocarbon carbon atoms for the halogen group, (3) tri-halides containing at least 8 hydrocarbon carbon atoms for each halogen group, (4) tetra or higher halides containing at least 5 hydrocarbon carbon atoms for each halogen group, said organic halogen compound being present in an amount to impart moistureproofness to the article.

2,098,540
MOISTUREPROOF ARTICLE
William Hale Charch, Buffalo, N. Y., and Merlin Martin Brubaker and Frederick M. Meigs, Wilmington, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 21, 1934, Serial No. 758,659
14 Claims. (Cl. 91—68)

1. An article of manufacture having a continuous unbroken moistureproof surface comprising a film-forming substance and a monobasic acid ester of a monohydric ether alcohol, said ether alcohol containing only one ether linkage, said ester having a melting point of at least 37° C. and containing at least 23 hydrocarbon carbon atoms as the moistureproofing agent, said ester being present in an amount to impart moistureproofness to the article.



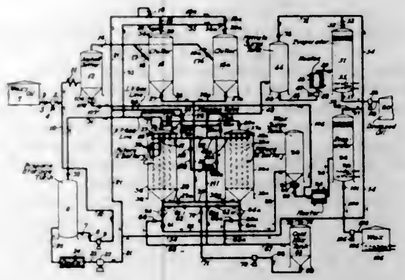
2,098,541
MOISTUREPROOF ARTICLE
William Hale Charch, Buffalo, N. Y., and Merlin Martin Brubaker and Frederick M. Meigs, Wilmington, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 21, 1934, Serial No. 758,660
22 Claims. (Cl. 91—68)

1. An article of manufacture comprising a base having a continuous coating comprising a film-forming substance and an organic-metallic compound in which the valences of the metallic portion of the compound are all satisfied by hydrocarbon carbon atoms and having a melting point of at least 37° C. as the moistureproofing agent, the organic-metallic compound being present in an amount to impart moistureproofness to the product produced from said composition.

2,098,542
MOISTUREPROOF ARTICLE
William Hale Charch, Buffalo, N. Y., and Merlin Martin Brubaker and Frederick M. Meigs, Wilmington, Del., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application December 21, 1934, Serial No. 758,661
26 Claims. (Cl. 91—68)

1. An article of manufacture comprising a base having a continuous coating containing a solid organic sulphur compound having a melting point of at least 37° C. and selected from the group which consists of thio ethers, mercaptans, thio aldehydes and thio acids, the organic sulphur compound being present in an amount to render said coating moistureproof.

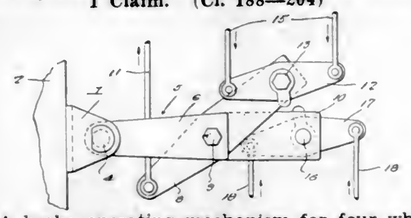
2,098,543
DISPLAY HOLDER
Arthur C. Handler and Morris H. Wansky, Akron, Ohio; said Wansky assignor to said Handler
Application April 19, 1934, Serial No. 721,411
6 Claims. (Cl. 24—81)



1. In a display holder, the combination with a clamp, a groove shaped receptacle to receive a display card, and an extended arm with an adjustable friction slide clamp adjacent thereto.

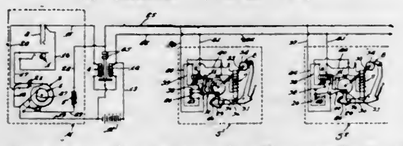
2,098,544
PROCESS OF MANUFACTURE OF SHREDDED GRAIN PRODUCT
James Robert Hill, Battle Creek, Mich., assignor to Ralston Purina Company, St. Louis, Mo., a corporation of Missouri
No Drawing. Application July 5, 1935, Serial No. 29,919
2 Claims. (Cl. 99—84)

1. The process of manufacture of a flavored shredded grain product which comprises softening the natural grains, applying deforming pressure to the grains sufficient to produce cracks in the exterior coating but insufficient to cause breaking off of any parts of the grains, partially cooking the grains, treating the grains with a flavoring material, and delivering them in whole grain form to shredding rolls.



2,098,545
PROCESS FOR FILTERING WAX FROM OILS
Basil Hopper and Kenneth Kingman, Palos Verdes Estates, Calif., assignors to Union Oil Company of California, Los Angeles, Calif., a corporation of California
Application March 25, 1935, Serial No. 12,770
12 Claims. (Cl. 196—19)

2. A process for filtering difficultly filterable slurries of crystallized wax and oil which have been removed as the unfiltered portion from a previous filtration of an originally easily filterable slurry, which comprises chilling a solution of waxy oil in a diluent consisting predominantly of hydrocarbons having a vapor pressure between ethane and butane, to form a chilled slurry of crystallized wax, oil and diluent, introducing said chilled mixture into a filter and subsequently introducing said difficultly filterable slurry of crystallized wax, oil and diluent into said filter, said oil in both of said easily and difficultly filterable slurries having substantially the same gravities.

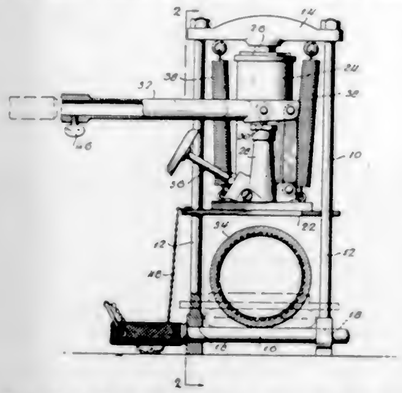


5. A process for filtering difficultly filterable slurries of crystallized wax and oil which comprises introducing chilled slurries of crystallized wax and oil into a filter under pressure until a wax cake of desired thickness is formed on the filter leaves of said filter, discontinuing the supply of chilled slurry to said filter and continuing filtration in said filter by imposing fluid pressure in said filter until a portion of the contents remaining in the filter shell after discontinuation of chilled slurry to said filter is filtered and discontinuing said filtration by imposed fluid pressure while a substantial portion of said contents still remains in said filter as a body of unfiltered slurry of crystallized wax and oil which may be readily withdrawn from said filter.

2,098,546
BRAKE OPERATING MECHANISM
Gerry G. Ingalls, Newport, Minn.
Application May 13, 1936, Serial No. 79,581
1 Claim. (Cl. 188—204)

A brake operating mechanism for four wheel brakes on automobiles including, a yoke pivotally mounted at one end for horizontal swinging movement and comprising a pair of upper and lower arms the lower one longer than the upper one, an operating lever pivotally mounted intermediate its ends between said arms and adjacent to the outer end of the shorter arm to swing about a vertical axis and having an inner end disposed intermediate the pivot thereof and the pivot of said yoke and an outer end adapted to overlie the outer end of the longer yoke arm, the inner end being connected to the brake pedal of the automobile, a brake rod lever pivoted intermediate its ends on the outer end of the longer yoke arm and having a pair of brake rods connected to its opposite ends, respectively, a similar brake rod lever pivoted intermediate its ends on the outer end of the operating lever at the same distance from the pivot of the operating lever as the pivot of the brake rod lever first mentioned, and a pair of brake rods connected to opposite ends of the last mentioned brake rod lever, respectively.

2,098,547
TIME CONTROLLED SYSTEM
Edward B. Jackson, Downers Grove, Ill., assignor to Stromberg Electric Company, Chicago, Ill., a corporation of Delaware
Application October 15, 1934, Serial No. 748,314
12 Claims. (Cl. 58—24)

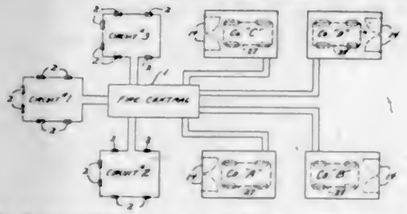


1. In a secondary apparatus for use in a corrective time controlled system, an operating magnet and an armature lever therefor, means mechanically operated by said lever upon energization of said magnet when said apparatus is in a predetermined chronological position for opening the circuit of said magnet, and a second magnet for holding said last means in operated position independently of its operating means.

2,098,548
HOSE JACK
Louis J. Kick, Union City, N. J.
Application April 15, 1936, Serial No. 74,463
3 Claims. (Cl. 251—5)

1. A hose jack comprising a four-sided frame, a hydraulic jack unit disposed within said frame and comprising a base and a cylinder fixed thereto and a plunger within said cylinder, said base engaging and being guided by the opposite side members of said frame, said plunger being fixed

with respect to an end of said frame, means associated and moveable with said cylinder for pumping liquid into the cylinder between the respective adjacent ends of the latter and the plunger whereby said cylinder is forced away from said end of said frame to compress the hose between the other end of said frame and said base, valve means



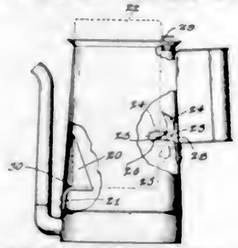
associated and moveable with said cylinder for relieving the liquid pressure to permit movement of said cylinder and plunger together to release the hose, and tension spring means secured at one end thereof to said frame and at the other end thereof to said unit and operating to urge said cylinder toward said plunger.

2,098,549

EMERGENCY ALARM AND MOTOR STARTING SYSTEM

George Edgar Luke, Syracuse, N. Y.

Application November 25, 1935, Serial No. 51,536
3 Claims. (Cl. 177—383)



1. An emergency system of the class described, comprising a call box circuit, an alarm circuit operable by the call box circuit, a housing station in the alarm circuit for housing a motorized emergency vehicle having an internal combustion engine for propelling the same and having electrical starting means including a power source on the vehicle for starting the engine under manual control of the vehicle operator, means for automatically starting the engine of the motorized emergency vehicle at the housing station independently of the power source on the vehicle and incident to initiation of an alarm signal from the call box circuit, said last-named means including another power source permanently maintained at the housing station and adapted to be connected with the starting means on the vehicle responsive to operation of the alarm circuit to transmit an alarm signal, and means operable at a point remote from the vehicle in the housing station for automatically starting the engine independently of the call box circuit.

2,098,550

DISPENSING RECEPTACLE

William B. W. Mann, Towson, Md., assignor of one-fourth to Robert E. Barry and one-fourth to Summerfield G. Nottingham, both of Washington, D. C.

Application December 12, 1933, Serial No. 702,083
35 Claims. (Cl. 221—23)

31. A liquid dispensing device comprising in combination, a hollow holder adapted to engage a sealed can containing a liquid to be dispensed, means for emptying said holder, and means operatively connected with the holder for cutting through the bottom and side walls of said can whereby the liquid will flow from the can into said holder.

2,098,551

REACTION PRODUCT OF AN ESTER-LIKE WAX AND A BASE

Ludwig Orthner, Leverkusen I. G. Werk, and Helmut Keppler, Leverkusen-Schlebusch, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application February 23, 1933, Serial No. 658,268. In Germany March 3, 1932
15 Claims. (Cl. 260—124)

6. The composition of matter which comprises as an essential ingredient a reaction product obtainable by reacting upon a natural or synthetic ester-like wax with a nitrogenous base selected from the group consisting of ammonia, primary and secondary aliphatic, cycloaliphatic, araliphatic and aromatic amines, polyalkylene-polyamines containing at least one hydrogen atom connected to a nitrogen atom, and piperidine, and treating the resulting compounds with an agent raising their hydrotropical properties selected from the group consisting of salifying, alkylating and acylating agents, the said reaction products being wax-like substances which are easily soluble or easily dispersed in water and having good properties as dispersing, softening, sizing, greasing, finishing, impregnating, cleansing, wetting, washing, foaming and equalizing agents.

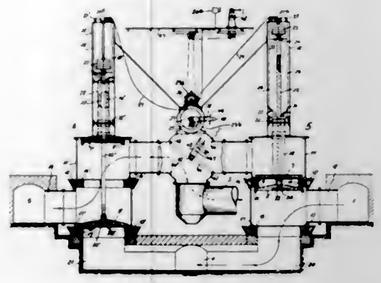
2,098,552

AGRICULTURAL IMPLEMENT

Martin J. Petersen, Canyon, Minn.

Application February 23, 1937, Serial No. 127,305
14 Claims. (Cl. 97—10)

1. A machine of the character described comprising a wheeled carriage having steering mech-



anism, a frame supported in the carriage, mechanism within said frame for feeding of earth in slice formation and turning of the slice upside down prior to delivery from the frame, a cutter forwardly of said frame for slicing earth from a ground surface, mechanism partly operative from a wheel of the carriage for elevating and lowering the frame away from and to working relation to the ground, and mechanism operative from a wheel of the carriage for driving the second-mentioned mechanism.

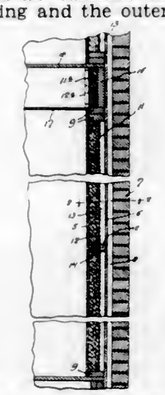
2,098,553

REGENERATIVE FURNACE

Otto Reiner, Rheinhausen/Niederrhein, Germany

Application September 28, 1936, Serial No. 103,023
In Germany October 2, 1935
10 Claims. (Cl. 277—6)

1. In a regenerative furnace, regenerator chambers, means for supplying heating gas to, and exhausting waste gas from, said regenerator chambers, a reversing apparatus comprising a pair of controls each connected to one of said regenerator chambers and to said exhausting means, a reversing valve connected to both controls and to said supplying means, a pair of controlling valves in each control for alternately connecting the corresponding regenerator chamber to said reversing valve and to said exhausting means, a timing mechanism, means for actuating the mechanism, means for operatively connecting the mechanism to the valves of each control for operating the controls in sequence, and means operatively connected to the mechanism for throwing over said reversing valve and regulating the admission of heating gas to said regenerator chambers in time with the operation of said controls.



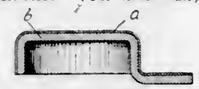
2,098,554

HEAT INSULATING WALL

Floyd Charles Reinke, Detroit, Mich., assignor to Air-O-Cel Industries Inc., Detroit, Mich.

Application July 14, 1936, Serial No. 90,599
2 Claims. (Cl. 72—16)

1. A heat insulating wall including a frame composed of horizontal joists and vertical studs, an outer wall member at the outer side of said frame, an inner wall member at the inner side of said frame and spaced from said outer wall member, an intermediate backing of corrugated cardboard extending between each pair of adjacent studs and spaced from the inner and outer wall members, a packing of fibrous insulating material filling the space between said intermediate backing and said inner wall member, and horizontal partitions of corrugated cardboard between the inner and outer wall members to prevent settling of said fibrous insulating material and to prevent convectional air currents in the space between said backing and the outer wall member,



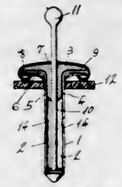
said partitions having end flanges nailed to said studs.

2,098,555

TEARABLE CLOSURE

Henry Arnold Skov, Frederiksberg, near Copenhagen, Denmark

Application April 24, 1934, Serial No. 722,166
In Denmark April 29, 1933
2 Claims. (Cl. 215—42)



1. A container closure in the form of a bottle cap, of the type which is adapted to be removed by tearing by means of a hand grip and formed of a material the strength of which corresponds to the strength of solid aluminium in a thickness of about 0.10 mm. consisting of at least one metallic layer and at least one thicker layer of non-metallic material adhesively secured to the metallic material, the metallic material containing metal of a thickness between 0.02 and 0.06 mm. while the thickness of the non-metallic material is on the one hand at least so great that the metallic and non-metallic layers have together a strength corresponding to that of aluminium of a thickness of about 0.10 mm. and on the other hand is not greater than to enable the material of the closure to retain its shape after being shaped and applied in a cold state.

2,098,556

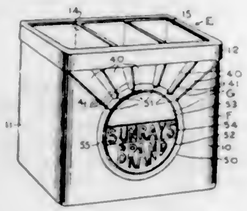
LEAKAGE-STOPPER FOR A HOSE

Eizo Tamada, Itoigawa-cho, Nishikubiki-gun, Niigata-ken, Japan

Application July 16, 1935, Serial No. 31,692
In Japan
5 Claims. (Cl. 138—98)

1. A leakage stopper for a hose consisting of a longitudinally slit tubular body joined at the base, spread apart at the top end and provided

with incisions at the slit edges about midway between the ends, a separate head member engaging the top ends of the tubular body and provided with an axial bore, a stem fitting loosely in said bore and in said tubular body and projecting at both ends thereof, a stud formed at the base end of said stem engaging the base of the tubular body, whereby when a pull is exerted at the top end of the stem said tubular body is collapsed outwardly at the incision portion causing the top and base to impinge the hose.



2,098,557

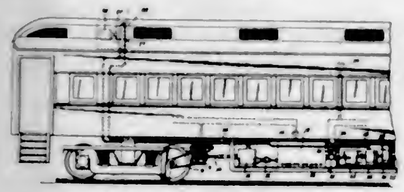
RECEPTACLE AND IDENTIFICATION CARRIER THEREFOR

Thomas A. W. Thomas, Los Angeles, Calif., assignor to States Batteries Ltd., Los Angeles, Calif., a corporation of California

Application November 11, 1935, Serial No. 49,309

5 Claims. (Cl. 40—2.2)

1. In a storage battery-jar, a container having rigid outer walls, at least one of said walls being provided with a recess in its outer face and the contour of said face being broken, providing indicia projecting to one side of the plane of said face, and an embossed identification carrier disposed within said recess and secured to the wall of said container, at least a portion of the embossing upon said identification carrier forming a continuation of said first-named indicia, said identification carrier being of acid-resistant material.



2,098,558

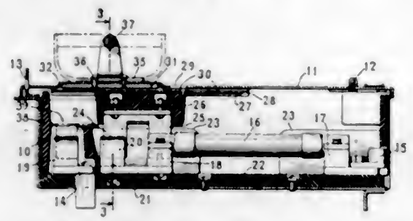
AIR CONDITIONING SYSTEM UTILIZING REFRIGERATION

Samuel M. Anderson and Robert T. Palmer, Sharon, Mass., assignors to B. F. Sturtevant Company, Inc., Boston, Mass.

Application November 23, 1935, Serial No. 51,296

4 Claims. (Cl. 62—117)

1. Air conditioning apparatus for a railway passenger car comprising air cooling means, a refrigerant compressor, a condenser, an air motor driving said compressor, a compressed air storage tank, means for heating the air in said tank, an axle driven air compressor feeding into said tank, and means for cooling said condenser with the air discharged by said motor.



2,098,559

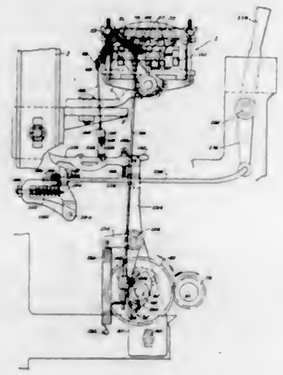
SAFETY SWITCH

William Anderson, Bromley, Ky., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut

Application February 3, 1936, Serial No. 62,173

2 Claims. (Cl. 200—114)

1. A safety switch including a box having a cover hinged to one edge thereof, a stationary contact mounted in the box and having its main contact surface extending at right angles to the hinged edge of the cover, a slide carried by the cover and slidable in a direction toward and away from the hinged edge, a switch blade carried by said slide and coacting with the stationary contact when the cover is closed, a handle carried by the cover and rotatable about an axis at right angles to the main plane of the cover, said handle projecting from the cover and serving to operate the slide to open the circuit and providing a hand grip for pulling the cover open.



2,098,560

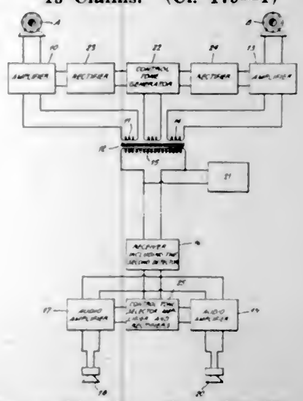
WARP STOP MOTION FOR LOOMS

Edwin W. Barrett, Barrington, R. I., assignor to Warren Textile and Machinery Supply Co., Warren, R. I., a corporation of Rhode Island

Application November 6, 1935, Serial No. 48,506

5 Claims. (Cl. 139—360)

1. In a warp stop motion, in combination, a feeler-bar of non-circular cross-section, a cylindrical bearing block supporting an end of such bar, a bearing for such block, a movable device normally effective to prevent longitudinal removal of the bar from the block, but movable into a position permitting such removal of the bar while preventing removal of the bearing block, and stop means locating said device in such position.



2,098,561

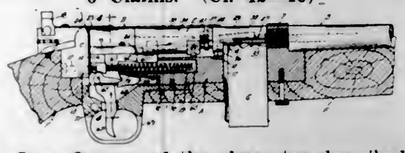
SYSTEM FOR PRODUCING STEREOSONIC EFFECTS

George Lisle Beers, Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application February 9, 1934, Serial No. 710,404

13 Claims. (Cl. 179—1)

1. The combination of a plurality of sound pick-up devices, a plurality of sound reproducers, means for combining the outputs of said pick-up devices, means for transmitting the combined outputs of said pick-up devices to said reproducers, a control current generator, means for varying the current produced by said generator in accordance with the relation between the sound intensities at said pick-up devices, and means actuated by said variable current for causing the sounds emitted at said reproducers to bear the same relation as the sound intensities at said pick-up devices.



2,098,562

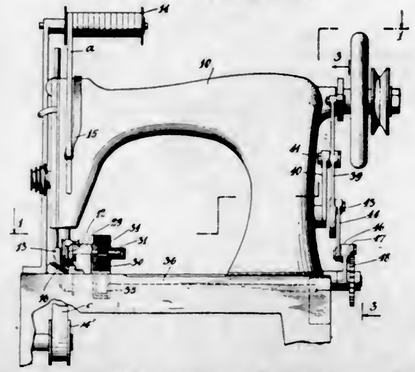
FIREARM

John Browning, Ogden, Utah, assignor to J. M. & M. S. Browning Company, Ogden, Utah, a corporation of Utah

Application October 17, 1935, Serial No. 45,411

6 Claims. (Cl. 42—16)

1. In a firearm of the character described, a receiver frame, a two-part bolt supported for sliding movement on said frame and having a front non-rotatable part and a rear rotatable part swivelled to the front part, a two-section firing pin comprising a front section mounted for longitudinal movement in said front part of said bolt and a rear section mounted for longitudinal movement in the rear part of said bolt and adapted to engage the rear end of said front section, a hammer mounted in said frame and having an upwardly extending hammer lug adapted to engage the rear end of said rear section when the hammer is released, and trigger means for controlling said hammer, said rear part of said bolt having a longitudinal groove adapted to register with and accommodate said lug when said rear part is turned to a position where the bolt may be withdrawn, said bolt having a lateral notch extending from said groove and adapted to accommodate said lug when the bolt is in forward locked position.



2,098,563

APPARATUS FOR MAKING WELT UNITS

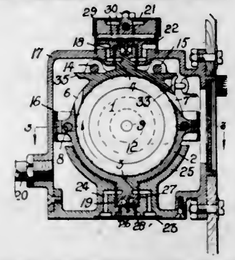
William C. Card, Jr., Winthrop, Mass., assignor to Compo Shoe Machinery Corporation, Boston, Mass., a corporation of Delaware

Application August 26, 1936, Serial No. 97,908

12 Claims. (Cl. 112—46)

1. A machine for sewing welt units comprising means for doubling a fabric fastening strip, means for stitching it to a welt, and means for feeding said welt and strip past said stitching means and for undoubling said strip.

2,098,564



MAGNETIC DIRECTIONAL GYROSCOPE

Leslie F. Carter and Carl A. Frische, Leonia, N. J., assignors to Sperry Gyroscope Company, Inc., Brooklyn, N. Y., a corporation of New York

Application October 11, 1934, Serial No. 747,859

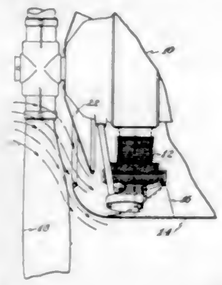
Renewed April 2, 1937

11 Claims. (Cl. 33—222)

1. A magnetic directional gyroscope comprising a ball gyroscope, a carrier therefor rotatable about a vertical axis, a permanent magnet carried by said carrier, air means for spinning and supporting said ball within said carrier on an additional horizontal axis, a magnetic member on said carrier around said ball, and a soft iron core having no permanent magnetism along the spin axis of the ball, whereby the device will seek the magnetic meridian.

2,098,565

ENGINE COOLING AND COWLING



Roland Chilton, Ridgewood, N. J., assignor, by mesne assignments, to The Reed Propeller Co., Inc., Garden City, N. Y., a corporation of New York

Application April 12, 1934, Serial No. 720,283

7 Claims. (Cl. 123—171)

6. In combination with a radial cylinder en-

gine having a propeller forward thereof and a fixed ring cowl encircling the outer cylinder ends and having an inturned leading edge terminating in a transverse plane between the engine and the propeller; a coned disc coaxial with said cowl, said disc slanting rearwardly from its center toward its edge, the disc edge lying rearwardly of said cowl leading edge to define with said cowl

edge a substantially radial air entrance annulus, the edge of said cowl being so proportioned that a tangent to said cowl at the leading edge thereof, in an axial plane, makes an angle of more than 45° with the cowl axis, said coned disc having such a form that an element thereof coplanar with said tangent and on the same side of the cowl axis, is substantially parallel to said tangent.

2,098,566

DE-ICING MEANS FOR AIRCRAFT

Roland Chilton, Ridgewood, N. J., assignor, by mesne assignments, to The Reed Propeller Co., Inc., Garden City, N. Y., a corporation of New York

Application October 27, 1934, Serial No. 750,253

2 Claims. (Cl. 244—134)

1. The combination with an aircraft having an engine exhaust pipe and a surface to be de-iced, of an alcohol reservoir, an evaporator attached to said pipe, porous covering over said surface, and means to conduct alcohol from said evaporator to saturate said covering.

2,098,567

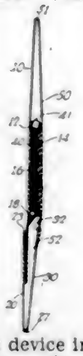
METHOD OF INCORPORATING NITROGEN IN ALLOY STEELS

George F. Comstock and Viatcheslav V. Efimoff, Niagara Falls, N. Y., assignors to The Titanium Alloy Manufacturing Company, New York, N. Y., a corporation of Maine

No Drawing. Application July 30, 1937, Serial No. 156,520

20 Claims. (Cl. 75—127)

1. A method of incorporating nitrogen in alloy steels which consists in adding a cyanonitride of an element chosen from the group consisting of titanium and zirconium as an alloy to the other ingredients to form the steel.



2,098,568

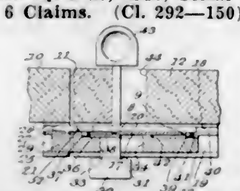
ADVERTISING DEVICE

Hayes Cone, New York, N. Y., assignor to United Specialties Sales Corporation, New York, N. Y., a corporation of Delaware

Application January 15, 1937, Serial No. 120,677

9 Claims. (Cl. 40—65)

1. An advertising device in the form of a card or folder comprising a front portion having a window therein, a flap portion normally lying flat adjacent the lower margin of the front portion and adapted to carry indicia on its outer side merging with indicia on the front portion, the flap portion being hingedly connected intermediate its upper and lower edges with the lower edge of the front portion, a movable curtain positioned behind the front portion and normally extending across the window therein, and means connecting the curtain with the flap portion so that movement of the latter relative to the front portion around said hinged connection results in upward movement of the curtain relative to the window.



2,098,569

FASTENER FOR CLOSURES

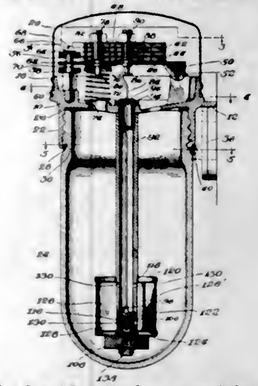
Clement N. Curtis, Weymouth, Mass.

Application April 17, 1936, Serial No. 74,931

6 Claims. (Cl. 292—150)

1. In a bolt mechanism for a movable closure, the combination of a latch bolt and a bolt mounted for movement into and out of their latching positions, means for dogging said latch bolt in its latching position as said latch bolt is moved into its latching position, and means controlled by said bolt for controlling said dogging means and for moving said latch bolt out of its latching position.

2,098,570



COMBINED PUMP AND RESERVOIR FOR CENTRALIZED LUBRICATING SYSTEMS

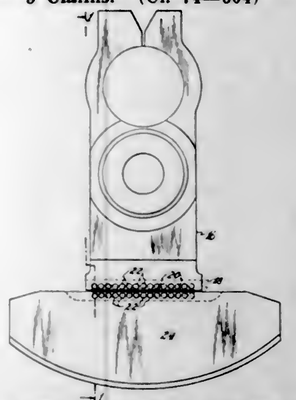
Ernest W. Davis, Oak Park, Ill., assignor, by mesne assignments, to Stewart-Warner Corporation, Chicago, Ill., a corporation of Virginia

Application April 1, 1929, Serial No. 351,694

24 Claims. (Cl. 184—26)

1. A lubricant supply installation for lubricating systems, comprising a body casting, a reservoir secured to and depending from said casting, a tube secured to said casting and depending within said reservoir, a cylinder carried at the lower end of said tube, a check valve at the dis-

charge end of said cylinder, a weight pivoted to said casting above said reservoir, a stem pivotally secured to said weight and extending downwardly into said tube, and a piston operable in said cylinder and pivotally connected to said stem.



2,098,571

LINK TYPE DYNAMIC DAMPER

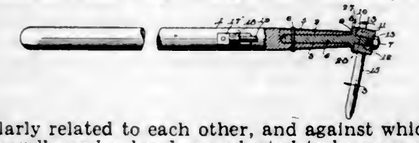
Chester C. De Pew, Bloomfield, N. J., assignor to Wright Aeronautical Corporation, a corporation of New York

Application September 21, 1935, Serial No. 41,531

3 Claims. (Cl. 74—604)

1. The combination with crankshaft and counterweight members, each having an axially extended plurality of opposed laterally extended grooves, of a laterally extended plurality of links in each groove, and a lateral plurality of hinge pins spanning said grooves and engaging said links for the oscillating connection of said links to each member.

2,098,572



RAKE

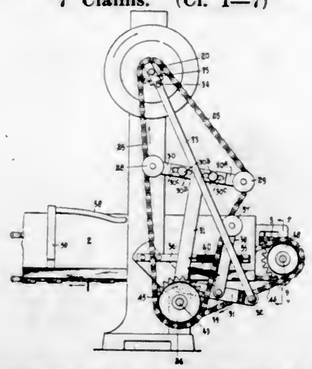
Harry K. Depue, Somerton, Pa.

Application October 29, 1935, Serial No. 47,211

3 Claims. (Cl. 306—35)

1. A connecting member for the head and handle of a rake, comprising angularly related arms and an integral peripherally extending flange, surrounding the intersection of the axes of said arms, and said flange being defined by faces angularly related to each other, and against which a handle and a head are adapted to be secured.

2,098,573



STAPLING MACHINE

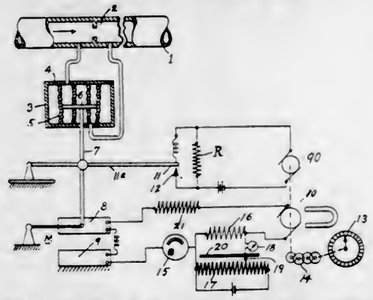
Howard Dingle, Kurralta Park, Australia, assignor to "McMahons" Limited, Adelaide, Australia

Application March 31, 1936, Serial No. 71,863

In Australia February 19, 1936

7 Claims. (Cl. 1—7)

1. Improvements in and relating to stapling machines, consisting in a conveyor to feed books to be stapled through the machine, and means for driving the conveyor intermittently comprising:—a sprocket wheel upon a driven shaft of the stapler, a sprocket wheel upon a shaft suitably supported in bearings and coupled to the conveyor, a chain having a comparatively large amount of slack interconnecting the two sprocket wheels, idler pulleys mounted upon a pivoted member, the chain engaging said idler pulleys, a crank upon the driven shaft of the stapler, and a rod connecting the pivoted member and the crank.

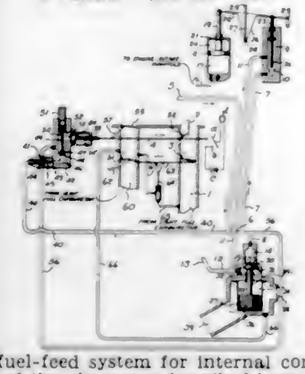


2,098,574

ELECTRICAL MEASURING SYSTEM

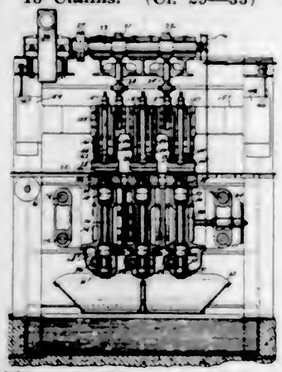
Edgar D. Doyle, Philadelphia, Pa., assignor to Leeds and Northrup Company, Philadelphia, Pa., a corporation of Pennsylvania

Application February 1, 1935, Serial No. 4,587



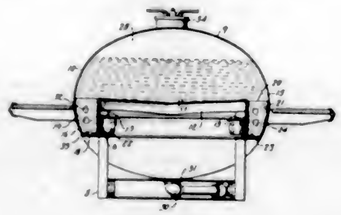
18 Claims. (Cl. 73—206)

1. A system for determining the magnitude of a condition which comprises means for produc-



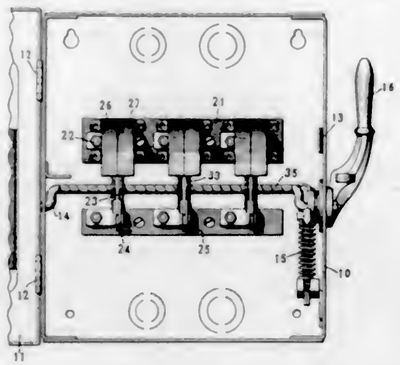
ing a force whose magnitude with respect to the magnitude of a condition under measurement follows a predetermined law of response, means for producing an electrical force whose magnitude with respect to the speed of rotation of a body substantially follows said law, means for effecting opposition of said forces, means for controlling the speed of rotation of said body to effect balance of said forces for the different magnitudes of said condition, and exhibiting means responsive to speed of rotation of said body.

2,098,575
SYSTEM FOR FEEDING FUELS TO INTERNAL COMBUSTION MACHINES
Francisco Flamini, Buenos Aires, Argentina
Application December 28, 1934, Serial No. 759,531
In Argentina March 13, 1934
3 Claims. (Cl. 123—127)



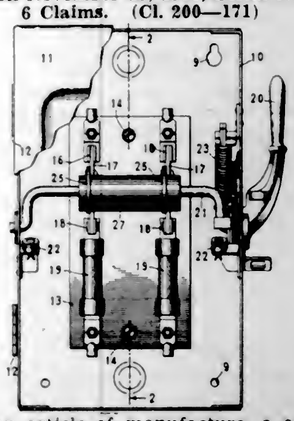
1. A fuel-feed system for internal combustion engines of the character described having means for the separate supply of light and heavy fuels to the engine, and control means for closing one fuel supply and opening the other, and means for actuating said control means comprising alternative passages for the flow of fluid from the engine, means actuated by the engine-suction for interrupting the flow of fluid in one of said passages, a thermostatic device for interrupting the flow of fluid in another of said passages, and means actuated by fluid pressure in still another passage to actuate the said control means.

2,098,576
AUTOMATIC MACHINE FOR TIE PLATES
Newton F. Foner, Pittsburgh, Pa.
Application March 13, 1935, Serial No. 10,850
18 Claims. (Cl. 29—33)



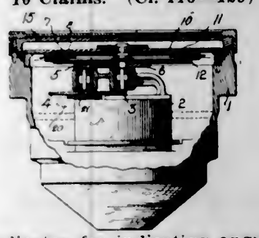
1. A milling machine comprising a table, means for feeding stock across the table, a cutter assembly including a plurality of sets of cutters for performing a plurality of cutting operations simultaneously and a movable carriage therefor, means for periodically advancing the stock, means for periodically clamping the stock on the table, and means for moving the cutter assembly to engage the stock during a dwell of the stock, and manually adjustable means for automatically and sequentially controlling said means.

2,098,577
TANK
Otto N. Gredell, Kansas City, Mo., assignor to Standard Steel Works, North Kansas City, Mo., a corporation of Missouri
Application July 16, 1934, Serial No. 735,327
4 Claims. (Cl. 220—1)



1. A tank of the character described including a reduced front end portion having a depending hollow skirt forming continuations of the sides of said reduced front end portion.

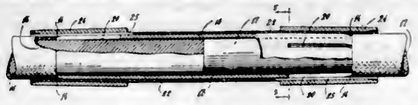
2,098,578
SAFETY SWITCH
Herman J. Hammerly, New Britain, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut
Application November 13, 1936, Serial No. 110,592
12 Claims. (Cl. 200—144)



1. A safety switch having a stationary contact and a hinged blade coacting therewith, and arc snuffing means including an insulating housing for the stationary contact closed on all sides except for passage and exit of the swinging blade and insulating means having an arcuate edge following the blade alongside the housing and constantly close thereto as the blade moves to open the circuit.

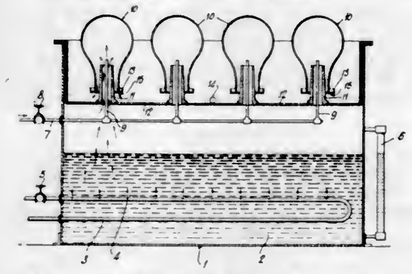
2,098,579
ENCLOSED SWITCH
Charles E. Hanny, Plainville, Conn., assignor to The Trumbull Electric Manufacturing Company, Plainville, Conn., a corporation of Connecticut
Application November 19, 1935, Serial No. 50,496
6 Claims. (Cl. 200—171)

1. As an article of manufacture, a connector for an electric switch formed of insulating material and having a longitudinal channel open at one side to detachably receive the crank shaft of a switch and having grooves in its outer wall spaced to interlock with the hooks of spaced switch blades.



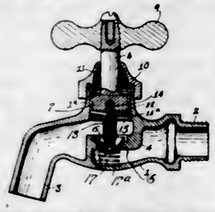
2,098,580
ANGULAR MOTION INDICATOR
William George Harding, North Acton, London, England, assignor to Sperry Gyroscope Company, Inc., Brooklyn, N. Y., a company of New York
Application May 5, 1934, Serial No. 724,073
In Great Britain May 8, 1933
10 Claims. (Cl. 116—129)

1. An indicator for indicating angular motion comprising two adjacent members, means for revolving said members through distances each at all times proportional to the angular motion to be indicated but different from each other, portions of one of said members having apertures therein, and indications such as numerals on the other member adapted to be viewed through said apertures.



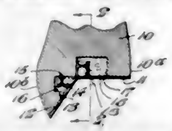
2,098,581
COUPLING
Samuel J. Jones, New York, N. Y.
Application August 8, 1934, Serial No. 738,905
6 Claims. (Cl. 173—268)

1. Means for connecting two electrical conductors together, a metal sleeve slotted at both ends and surrounding said conductors, a tube of flexible insulation slotted at its ends and surrounding said sleeve and slightly tapered metal



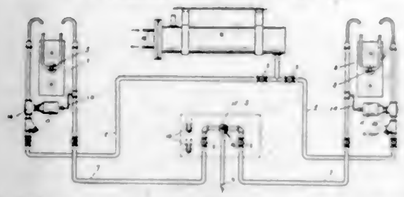
rings surrounding said tube and forcing said sleeve into firm facial contact with said conductors.

2,098,582
PROCESS OF TREATING LAMPS
Frederick Kallus, Hoboken, N. J.
Application June 4, 1936, Serial No. 83,445
3 Claims. (Cl. 41—42)



3. A process of treating bulbs which comprises subjecting them to an etching fluid upon the interior and subsequently treating them to the mixture which is formed by blowing steam through a hot water bath for a period of about seven seconds and then washing them with water.

2,098,583
VALVE
John J. Kleinsmith, Cleveland, Ohio
Application March 17, 1937, Serial No. 131,349
1 Claim. (Cl. 251—139)

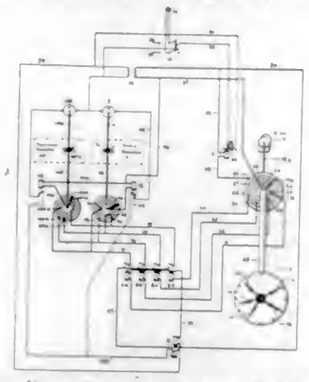


A valve construction comprising a body provided with a transverse wall formed with an opening to provide a valve seat and a collar in concentric relation to said seat, the inner wall of said collar being provided with screw threads and formed with a plurality of longitudinally extending grooves, a valve element arranged to engage said seat and provided with a stem extending into said collar, means for operating said valve element in a direction to seat it, said means including a body portion having screw threaded engagement with the screw threads in said collar and formed axially of said seat with an elongated opening into which said stem slidably fits, the bottom of said elongated opening being arranged to engage the free end of said stem and forming a removable pivotal connection therewith to move the valve element into engagement with said seat, and a device fixed to said stem and slidably engaging the grooves in said collar for preventing rotation of said valve element.

2,098,584
INTERCHANGEABLE TEETH
Benjamin A. Lincoln, Philadelphia, Pa., assignor to Universal Dental Company, Philadelphia, Pa., a corporation of Pennsylvania
Application December 18, 1934, Serial No. 757,987
6 Claims. (Cl. 32—9)

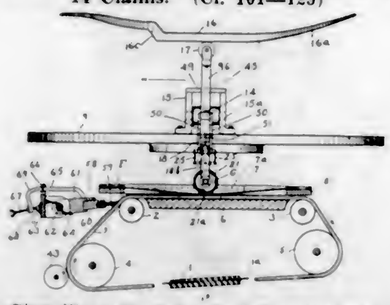
1. An interchangeable artificial posterior tooth comprising an all-ceramic body having therein a recess with two angularly disposed, meeting sides, each having a plane surface, both of said sides terminating at the lingual wall of said body, a pinhole extending inwardly into said body from one of the sides of said recess with its axis parallel to the other of said sides and a slot extending into said body solely from said other side.

2,098,585
REVERSING FURNACE CONTROL
Fred H. Loftus, Mount Lebanon, Pa.
Application May 13, 1937, Serial No. 142,374
4 Claims. (Cl. 158—36)



2. The combination with pipes for supplying fluid fuel to two ports of a regenerative furnace, valves for severally controlling the flow of fuel into said ports, valve-operating means organized with each valve adjacent to the respective ports, and conduits arranged to deliver fluid under pressure for jetting the fuel supplied by said pipes into said ports, of a remote control station including means for selectively controlling the supply of fluid under pressure to said conduits and effecting the energizing of said valve-operating means, to open one of said valves while closing the other.

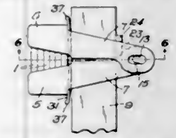
2,098,586
REVERBERATORY FURNACE
Earl R. Marble, El Paso, Tex., assignor to American Smelting and Refining Company, New York, N. Y., a corporation of New Jersey
Application November 30, 1935, Serial No. 52,298
8 Claims. (Cl. 263—46)



1. A reverberatory furnace comprising the combination with a semi-cylindrical pan, a cradle supporting said pan, a semi-cylindrical brick hearth in said pan and supporting the furnace side walls, of an arch supported independently of said walls.

2,098,587
AUTOMATIC OPERATION OF PLURALITY OF RADIO RECEIVERS
Jesse Markowitz, New York, N. Y.
Application October 12, 1931, Serial No. 568,267
4 Claims. (Cl. 250—20)

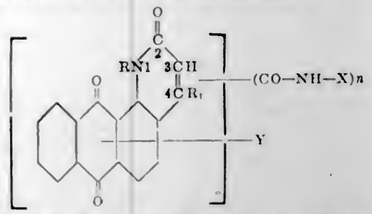
4. In radio reception apparatus, a clock, a movable contact control member operated by said clock, a radio receiver, a television receiver, a motor for tuning in said radio receiver, a motor for tuning in said television receiver, operating mechanism in a circuit of which said member is a part for simultaneously energizing both motors, and an operating mechanism adapted to be energized when its motor has tuned in its receiver for deenergizing said motor.



2,098,588
STENCILING APPARATUS
Frederick B. McQuiston, Crafton, and Ernest M. Hommel, Pittsburgh, Pa., assignors to The O. Hommel Company, a corporation of Pennsylvania
Application July 9, 1936, Serial No. 89,742
14 Claims. (Cl. 101—125)

1. Stenciling apparatus including a stencil impervious in main and pervious in pattern, means adapted to present an extended surface adjacent to the pattern area of said stencil a film of moist decorating material, said means comprising a body of elastic material having a film-bearing surface impervious to said moist decorating material, means for applying said material upon such surface, means for spreading and smoothing the applied material to provide uniformity in the applied film, a rotary work-carrier, said work-carrier including means yieldingly sustained for rotatably supporting a round object to be decorated, means for rotating said work-carrier whereby said object is rolled in arcuate path

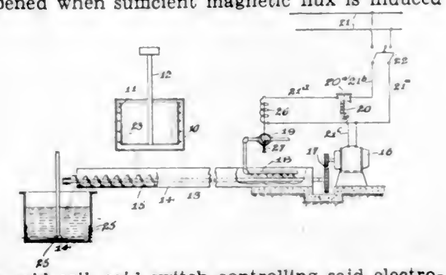
across the pattern area of said stencil, and an arcuate cam mounted in spaced relation with respect to said stencil and adapted to engage said object-supporting means, whereby, during the rotation of said work-carrier, the supported object is positively shifted against the resistance of its yielding sustaining means transversely of said arcuate path.



2,098,589
LOOM PICKER
Frank W. Merrick, Boston, Mass., assignor to American Stay Company, East Boston, Mass., a corporation of Massachusetts
Application May 19, 1934, Serial No. 726,511
13 Claims. (Cl. 139—159)

1. A loom picker having, in combination, a bunter head, and means for securing said bunter head to a picker stick comprising separable unconnected relatively movable portions for engaging with opposite lateral sides of said head and with the outer end face only thereof, said means also comprising a picker stick embracing portion carrying means cooperating with said stick for drawing said portions and bunter head toward the stick.

2,098,590
VAT DYESTUFFS OF THE ANTHRAQUINONE SERIES
Paul Nawiasky, Alfred Ehrhardt, and Karl Saftien, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application November 2, 1935, Serial No. 48,048. In Germany November 3, 1934
5 Claims. (Cl. 260—40)

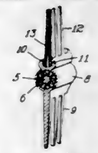


1. Vat dyestuffs of the anthraquinone series corresponding to the general formula

wherein R and R_1 stand for a member selected from the class consisting of hydrogen, the alkyl groups and the aryl groups of the benzene series, X for an aryl group of the anthraquinone series, and *n* for a whole number up to 2, and wherein Y stands for a member selected from the class consisting of hydrogen and halogen.

2,098,591
AUTOMATIC CONTROL
Jacob J. Neuman, Jamaica, N. Y.
Application January 13, 1936, Serial No. 58,804
4 Claims. (Cl. 127—22)

1. An automatic sweetwater control for an electric motor driven conveyor and screw having an electromagnetic valve for said sweetwater and a relay to control said valve in series with said motor, said relay including a primary coil in series with the motor, and a magnetic mercury switch suspended beneath said coil and adapted to be opened when sufficient magnetic flux is induced

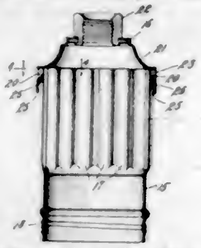


in said coil, said switch controlling said electromagnetic sweetwater valve to open the same when due to increased resistance in the conveyor screw the motor draws a current higher than that normally drawn.

2,098,592
PREPARATION OF DIMETHYLFURANE
Granville A. Perkins and Walter J. Toussaint, Charleston, W. Va., assignors, by mesne assignments, to Union Carbide and Carbon Corporation, a corporation of New York
No Drawing. Application March 28, 1935, Serial No. 13,482
4 Claims. (Cl. 260—54)

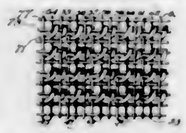
1. A process which comprises pyrolyzing acetone at a temperature above 700° C. for a period not greater than about 0.15 second, immediately cooling the reaction gases in a liquid medium, and isolating 2,5-dimethylfurane from the resulting liquid mixture.

2,098,593
HAIR WAVING APPLIANCE
Louis Quinio, Tarentum, Pa.
Application July 17, 1936, Serial No. 91,144
3 Claims. (Cl. 132—14)



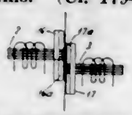
3. A hair comb comprising a metallic tubular base having a row of teeth integrally formed therewith and having a slotted portion opposite said row of teeth and out of communication with the hollow interior of said base, a comb removably mounted in said slotted portion, having hollow teeth, and means for heating the inner chamber of the tubular base member.

2,098,594
LAMP SOCKET
Frederick R. Reutter, Waterbury, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut
Application October 15, 1935, Serial No. 45,078
3 Claims. (Cl. 173—362)



2. In a lamp socket, and in combination, a metal shell having its upper portion formed with a plurality of recesses, locking nibs located in said recesses, a metal cap having a top portion and a depending skirt for taking over the upper end of the shell, and a plurality of locking lugs,

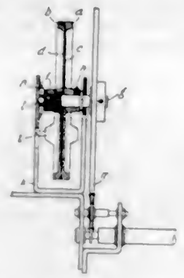
for cooperating with said nibs, located inside said skirt and formed of tongues of metal shaved



from the inner wall of the skirt and integrally rooted thereto.

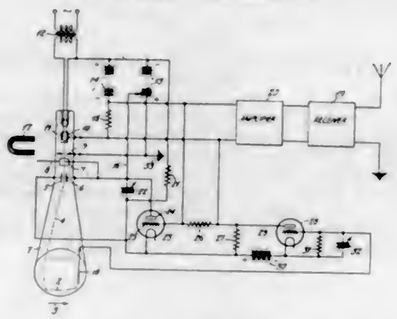
2,098,595
PILE FABRIC
Walter A. Rice and Frank G. Shinn, Yonkers, N. Y.
Application March 26, 1932, Serial No. 601,420
19 Claims. (Cl. 139—400)

1. A knotted pile fabric having stuffer type warp threads woven straight through the fabric in unbending relation and chain warp threads which are bent below and above the weft, weft uniting the stuffer and chain warp threads and tuft knots passing back of all of the warp threads and forming a back for them.



2,098,596
TELEGRAPHONE AND LIKE APPARATUS
Noël Meyer Rust and Cyril John Francis Tweed, Essex, England, assignors to Radio Corporation of America, a corporation of Delaware
Application July 23, 1935, Serial No. 32,752
In Great Britain May 28, 1934
6 Claims. (Cl. 179—100.2)

1. An electro-magnetic recording or pick-up device comprising a pole tip made of substantially uniform cross-section throughout an appreciable portion of its length, said portion being embedded in a mouldable non-magnetic insulating material having a resistance to wear of the same order as that of the material of the pole-tip proper, the said pole tip being made of laminations extending transversely of the direction of record travel.

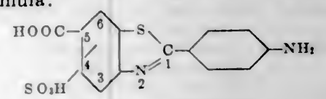


2,098,597
VARIABLE CONDENSER
Franz Saar, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application August 4, 1934, Serial No. 738,458
In Germany August 11, 1933
6 Claims. (Cl. 175—41.5)

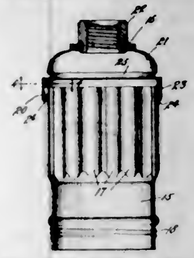
1. Variable condenser, in particular rotatable condenser having two conductive layers of different polarity displaceable with respect to each other, characterized in that the conductive layers are provided on faces remote from each other of

plates consisting of iron free magnesium silicate, said plates gliding over each other in intimate contact.

2,098,598
SYNCHRONIZING SYSTEM
Fritz Schröter, Berlin, Germany, assignor to Telefunken Gesellschaft für Drahtlose Telegraphie m. b. H., Berlin, Germany, a corporation of Germany
Application November 21, 1932, Serial No. 643,596
In Germany December 12, 1931
2 Claims. (Cl. 178—6)



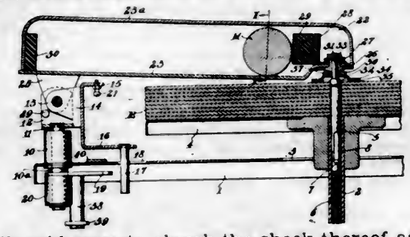
1. In a television system a cathode ray tube, means for deflecting the cathode ray developed within the tube, said means comprising a condenser and means for uniformly charging the condenser, a gaseous space discharge device normally biased below cut-off and operable at predetermined time periods to discharge said condenser, said means for biasing the gaseous space discharge device below cut-off comprising a normally operative amplifier tube having in its output circuit a resistor the voltage drop through which is adapted to bias the control electrode of the said space discharge device, an electrode element provided within the cathode ray tube and subjected at points of maximum sweep of the cathode ray pencil to the electron stream of the said pencil, a connection between said electrode and the input circuit of said amplifying device so that during time periods when said electrode is subjected to the influence of the electron pencil biasing voltages are applied to the amplifying tube to cause said tube to become inoperative, and a resistor means connected with the input circuit of the said space discharge device and subjected to currents representing predetermined normal times of completion of



the sweep circuit for biasing the said space discharge device above cut-off independently of the operation of the amplifying tube.

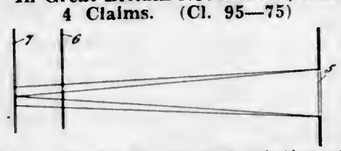
2,098,599
YELLOW SUBSTANTIVE DYESTUFF FOR COTTON
Max Schubert, Frankfort-on-the-Main-Fechenheim, Germany, assignor to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application October 23, 1935, Serial No. 46,335. In Germany November 7, 1934
1 Claim. (Cl. 260—44)

A yellow substantive dyestuff for cotton, which dyestuff forms when dry an orange powder easily soluble in water and dyes vegetable fibers greenish yellow shades of excellent fastness to light, which dyestuff dissolves in concentrated sulfuric acid to a reddish brown solution, which dyestuff is obtained by acting with alkaline oxidizing agents containing reactive chlorine on 1-p-aminophenyl-5-carboxybenzothiazole-sulfonic acid of the formula:



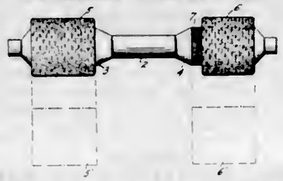
2,098,600
LAMP SOCKET
Sydney I. Spender, Waterbury, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a corporation of Connecticut
Application October 15, 1935, Serial No. 45,032
5 Claims. (Cl. 173—362)

1. In a lamp socket, and in combination, a shell having its upper portion fluted, a plurality of downwardly facing locking shoulders on said shell and located in the flutes thereof, a cap having a top portion and a depending skirt for taking over the upper end of the shell, and a plurality of scallop-shaped lugs extending inwardly from the bottom edge of the cap skirt for cooperating with said shoulders to prevent axial separation of cap and shell and for fitting in said flutes to prevent relative rotation thereof.



2,098,601
RECORD TRANSFER DEVICE FOR AUTOMATIC PHONOGRAPHS
John H. Teaf, Camden, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application April 10, 1934, Serial No. 719,831
22 Claims. (Cl. 274—10)

16. A record transfer arm comprising a hollow, elongated member, a record engaging member on one end thereof, a mass movable within said member whereby its center of gravity may be changed, and a shock absorbing device adjacent each end of said member adapted to cooperate



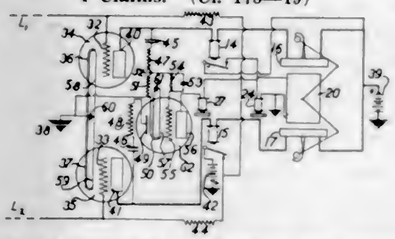
with said mass to absorb the shock thereof as it comes to rest after a period of movement.

2,098,602
COLOR PHOTOGRAPHY
Stanley Dennis Threadgold, Ilford, England, assignor, by mesne assignments, to Dufay-Chromex Limited, Aldwych, London, England
Application October 19, 1935, Serial No. 45,823
In Great Britain November 3, 1934
4 Claims. (Cl. 95—75)

1. Apparatus for the contact printing of multi-color photographic master originals of regular pattern multi-color screen type on to photographic copy material of multi-color screen type which comprises a source of diffused light spaced from the master, photographic copy material spaced from the master to receive light from the light source passing through the master; the effective diffusion area of the light source, its distance from the master, and the spacing of the master and copy being such that an image of each screen element of one color on the master is enlarged on the photographic copy to overlap adjacent color elements and overlap adjacent images of the same color to the extent that the sum of the light intensities at the overlapping portions of the images substantially equals the intensity at the central portions of the images, thus producing substantially even illumination over the whole copy surface.

2,098,603
COT
William B. Tucker, Lancaster, Pa., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania
Application February 7, 1935, Serial No. 5,378
10 Claims. (Cl. 19—143)

5. A cot for covering rolls or the like, the entire body of said cot being formed of material of such character that it is compressible axially to an objectionable extent when subjected to frictional forces set up in applying the cot to a roll, com-

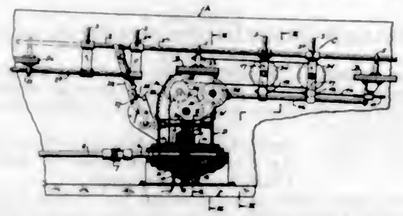


prising a hollow cylindrical body, having a resilient working surface and a dried, renitent coating applied to the body and rendering said cot resistant to such axial compression upon its application to a roll.

2,098,604
SUGAR MANUFACTURE
Robert Whymper, New York, N. Y., assignor to The National Sugar Refining Company of New Jersey, Edgewater, N. J., a corporation of New Jersey
No Drawing. Application July 25, 1935, Serial No. 32,997
11 Claims. (Cl. 127—30)

6. The method of manufacturing sugar which comprises the steps of mechanically working a sugar solution composed of sucrose and non-crystallizable matter derived from the crude syrup at an elevated temperature until such solution is reduced to a pasty consistency, then forcing the paste through a multiplicity of orifices to give the same an elongated form, then severing the elongated particles to a predetermined size, and thereafter allowing the shortened particles to dry and cool by their own heat of crystallization to obtain sugar granules of appreciable thickness.

8. As a new article of manufacture, a non-sticking sugar granule consisting of a porous structure, the exposed portion of which comprises a broken surface presenting no flat contact areas, said granule being made directly from "mother liquor."

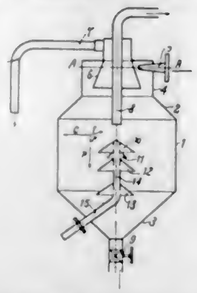


2,098,605
TELAUTOGRAPH RECEIVER
Adolph J. Wohlgemuth, Brooklyn, N. Y., assignor to Thomas Electric Company, West New York, N. J.
Application February 14, 1935, Serial No. 6,504
4 Claims. (Cl. 178—19)

1. A telautographic communication system comprising a sending station, a source of direct current at the sending station, a pair of lines, a receiving station, vacuum tubes connected to said lines at the receiving station, a pair of relays responsive respectively to different minimum currents controlling the graphic representation means and each connected to the plate of one of said vacuum tubes and a source of auxiliary potential at the receiving station in the circuit controlled by the relay responsive to the higher minimum current, and means for applying said auxiliary potential to the control electrodes of said vacuum tubes on the passage of said higher minimum current to cut off the current in the plate circuits of said vacuum tubes.

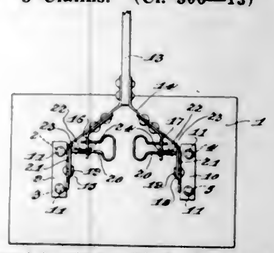
2,098,606
LIFEBOAT PROPELLING MECHANISM
Clarence W. Allen, San Francisco, Calif.
Application February 24, 1936, Serial No. 65,452
6 Claims. (Cl. 115—24)

1. A boat propelling device comprising reciprocable rods, supports for said rods fixed relative to said boat, cables operated by said rods, a plurality of handles on said rods, brackets fixed to said rods, guide pulleys for said cables rotatably mounted in said brackets, a guide rod



fixed relative to said boat, and means on said brackets slidable on said guide rods whereby axial turning of said reciprocable rods is prevented.

2,098,607
CLEANING AND POLISHING COMPOSITION
Lowell C. Allen and Bryan B. Doughty, Belleville, Ill.
No Drawing. Application March 26, 1935, Serial No. 13,175
1 Claim. (Cl. 87—5)

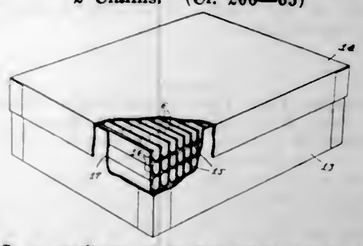


A liquid composition for use in impregnating cloth to impart surface cleaning and polishing activity thereto, said composition comprising the resultant of a mixture of approximately 95% of water, 3% of paraffine oil, 1% of vinegar, ½% of turpentine, and ½% of linseed oil.

2,098,608
APPARATUS FOR THE PURIFICATION OF MISCELLANEOUS LIQUID MIXTURES
André Bergès, Lorp, France
Application March 12, 1936, Serial No. 68,535
In France March 14, 1935
5 Claims. (Cl. 210—58)

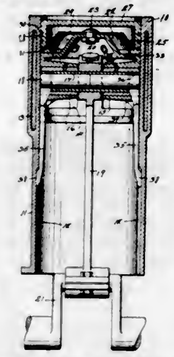
1. A device for the continuous purification and classification of heterogeneous liquid mixtures, comprising a fixed closed receptacle of circular cross-section, an inlet conduit arranged tangentially to said receptacle and adapted to maintain the receptacle filled with the liquid mixture under pressure, an upper central conduit for upwardly discharging part of the liquid mixture, a lower central conduit, having its upper end below the lower end of the upper central conduit, for downwardly discharging another part of the liquid mixture, said lower conduit having lateral openings therein traversed by the part of the liquid discharged through the lower conduit, and a plurality of superposed hollow cones mounted on the lower conduit adjacent the openings.

2,098,609
SHOVEL WITH ADJUSTABLE HANDLE
Harry Z. Bishop, Lyons, N. Y.
Application June 17, 1936, Serial No. 85,758
3 Claims. (Cl. 306—13)



1. A shovel having a blade, brackets mounted on either side of the center of said blade and extending rearward therefrom, a handle having arms thereon that extend outwardly therefrom, the ends of said arms being parallel to the brackets and pivoted thereon, pins mounted on said arms engaging with notches in the brackets by which the position of the handle can be adjusted angularly with reference to the blade of the shovel, said pins being mounted between the arms and moving parallel to the blade to engage the brackets.

2,098,610
DENTAL FLOSS HOLDER
Charles E. Bluhm, Rochester, N. Y.
Application May 6, 1937, Serial No. 141,137
5 Claims. (Cl. 132—92)



1. A device for holding a short length strand of dental floss exposed in tension, said device comprising a hollow handle having a receiving spool and a supply spool located therein, a shaft on which both of said spools are mounted to rotate, one of said spools rotating idly on said shaft and the other spool being keyed to said shaft and driven thereby.

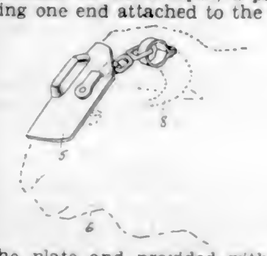
2,098,611
TAG PACKAGE
William Borchert, Rockford, Ill., assignor to The Tagit Company, Rockford, Ill., a corporation of Illinois
Application July 23, 1934, Serial No. 736,497
2 Claims. (Cl. 206—65)

1. In a package of U-shaped laundry tags, a box of flexible sheet material having upright end and side walls and containing layers of U-shaped laundry tags disposed side to side and open end up in parallel rows, and a horizontal separator of flexible sheet material interposed between superimposed layers of tags, the separator being formed at the ends to provide upwardly projecting flanges engaging the sides of the endmost tags of the rows to provide lateral support therefor independently of engagement with the adjacent side walls of the box, said flanges in turn bearing against the inside of the adjacent walls of the box so as to be maintained in upright position.

2,098,612
FLOATING PISTON STRUCTURE
Franklin F. Bronson, Richmond, Va.
Application February 27, 1936, Serial No. 66,088
7 Claims. (Cl. 309—15)

1. A piston structure including a hollow body having an outwardly extending boss at its center, a resilient disk detachably connected to said boss and extending outward beyond the boss, and a piston head having an annular inwardly extending flange with which the resilient disk engages, the resilient disk urging the inner edge face of the head against said body.

2,098,613
AUTOMATIC PARACHUTE
Henry A. Burgess, Los Angeles, Calif., assignor of one-half to Silas A. Morehouse
Application February 1, 1937, Serial No. 123,417
9 Claims. (Cl. 244—150)

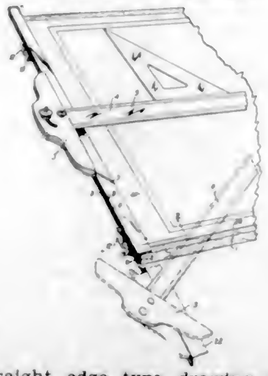


1. In combination with a parachute pack having a release mechanism for releasing the parachute in response to actuation of said release mechanism, flexible cable means extending from said pack and air anchor means on the outer end of said cable offering substantial resistance to an air stream whereby said air anchor means trails leeward of the pack in an air stream regardless of the position of the pack in the air stream, and means independent of tension exerted on said cable means for actuating said release mechanism in response to creation of an air stream past said anchor means.

2,098,614
HEAD BUMPER FOR ANIMALS
James A. Caldwell, San Antonio, Tex.
Application June 28, 1937, Serial No. 150,846
1 Claim. (Cl. 119—143)

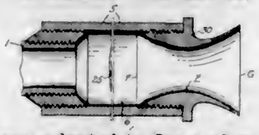
An animal protector comprising a resilient plate adapted to rest against and cover the fore-

head of the animal, a resilient bumper on the outer surface of the plate, said plate having slots one at each side of the bumper, a pair of links each having one end attached to the upper sur-



face of the plate and provided with an offset portion positioned in one of said slots to extend the other end of the link below the plate and clamping means for attaching the links to the horns of the animal.

2,098,615
SHAFT OR ROD FOR GOLF CLUBS OR OTHER SPORTING IMPLEMENTS
Robert H. Cowdery, Geneva, Ohio, assignor to The American Fork & Hoe Company, Cleveland, Ohio, a corporation of Ohio
Application June 19, 1935, Serial No. 27,343
2 Claims. (Cl. 273—80)

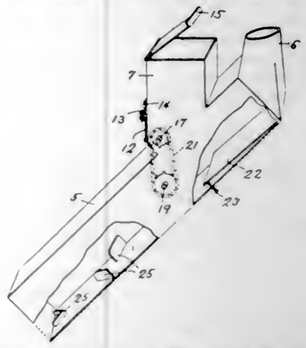


1. A shaft for golf clubs comprising a metallic ribbon so wound in generally spiral form with successive convolutions in overlapped relation as to form a progressively tapered tube, the convolutions being of such width and the pitch of the winding being of such a degree that each successive convolution overlaps a substantial portion of the width of a preceding convolution, and a reenforcing liner disposed within said tapered tube with its outer wall in engagement with such portions only of successive convolutions overlying said liner which are disposed nearest an edge portion of such convolutions, and means bonding the so engaged portions of said successively engaged convolutions to the liner to prevent relative longitudinal movement of the said portions of said convolutions relative to said liner, other portions of said convolutions longitudinally spaced from the bonded engaged portions being free of engagement with said liner and adapted to have a slight amount of shock absorbing movement relative to the underlying portion of the liner when said shaft is subjected to abrupt stresses tending to bend the shaft.

2,098,616
DRAFTING INSTRUMENT
Richard H. Cutting, Cleveland, Ohio
Application October 18, 1935, Serial No. 45,627
10 Claims. (Cl. 33—76)

1. A straight edge type drawing implement comprising a strip of metal of angle cross-section, one flange adapted to abut the vertical edge of a drawing board or the like slidably supporting clamping means movable toward and from the other flange for clamping the edge portion of a drawing board therebetween, and the strip having a planar portion for guiding the head of a T-square.

2,098,617
SPREADER TUBE
Richard M. Cutts, Jr., Quantico, Va.
Application July 14, 1936, Serial No. 90,580
14 Claims. (Cl. 42—79)

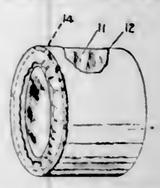


1. In a gun adapted to fire a plurality of projectiles with a single powder charge and provided with a muzzle, the combination of an expansion chamber to receive the gases of explosion as they emerge from said muzzle together with the projectiles said chamber permitting a deviation of said projectiles from the established line of flight; and a spreader tube at the forward end of said chamber coaxial with said chamber and said muzzle, said tube having two concentric tapered interior surfaces respectively tapering in opposite directions and having their respective smaller diameters joined to form a throat, the diameter of the throat being greater than the bore of the muzzle.

2,098,618
MACHINE FOR TREATING SEED GRAIN
John H. Dostert, Crookston, Minn.
Application July 6, 1936, Serial No. 89,270
3 Claims. (Cl. 221—96)

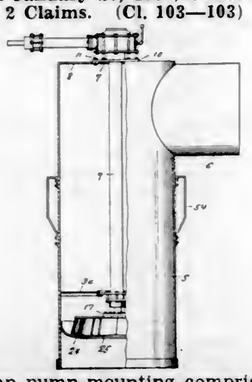
1. In a seed treating machine, an inclined tubular chute, a chemical box mounted on the top side of the chute, a partition wall common to the chute and the box and provided with openings for the passage of chemical from the box into the chute, a rotary agitator mounted interiorly of the chute to be rotated by impact of seed grain passing down said chute, a rotary feed wheel mounted in

the box in operative position to said openings, and a driving connection between said rotary agitator and said rotary feed wheel, and a regulating valve for said openings to control the passage of chemical from the box to the chute, a jumper plate



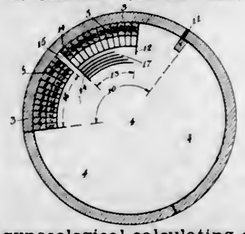
mounted in the bottom of the chute adjacent the upper end of the latter and means engaged with the plate for securing the same at the desired angle for directing grain passing into the chute against the blades of the rotary agitator.

2,098,619
CIGARETTE
Charles S. Finnell, El Paso, Tex.
Application February 29, 1936, Serial No. 66,481
2 Claims. (Cl. 131—52)



1. A cigarette comprising an inner wrapper of inflammable material, and a longitudinally corrugated outer wrapper enclosing said inner wrapper, said outer wrapper including a reduced, uncorrugated end portion, and a tip encircling said end portion and forming a mouthpiece for the cigarette.

2,098,620
ARTIFICIAL THREAD TREATMENT
John S. Fonda, Kenmore, N. Y., and George W. Filson, Richmond, Va., assignors, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application December 24, 1935, Serial No. 56,058
4 Claims. (Cl. 34—24)

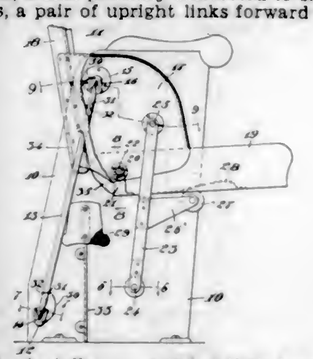


1. A covering for protecting artificial thread packages during the drying thereof comprising a cylindrical, moisture impermeable elastic band which is longer than said package and has a circumference which in its unstretched state is from 5% to 10% smaller than the circumference of the package to be dried.

2,098,621
SUMP PUMP MOUNTING
Leonard E. Golinick, Vero Beach, Fla.
Application January 27, 1937, Serial No. 122,673
2 Claims. (Cl. 103—103)

1. A sump pump mounting comprising a casing open at its lower end and having a discharge port adjacent its upper end, a pump shaft positioned in the casing and extending through the top thereof, a plate secured to the lower end of the shaft, an impeller removably secured to said plate, a housing for the shaft, a flange on the housing and a ring member supported within the casing and forming a support for the flange to center the shaft in the casing, said ring member having a central opening to provide for withdrawal of the shaft and plate therethrough after removal of the impeller from the shaft.

2,098,622
GYNECOLOGICAL CALCULATING DEVICE
George Bott Gronvold, Seattle, Wash.
Application December 18, 1934, Serial No. 758,047
12 Claims. (Cl. 40—115)

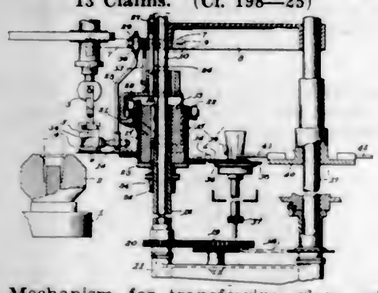


11. In a gynecological calculating device a stationary member and a movable member held on said stationary member, said stationary member having a single set of scale groups thereon in sequence one group of thirty-one divisions, one group of thirty divisions, and one group of twenty-eight divisions, representing months of varying lengths, said movable member being provided with indicating means corresponding in their positions to the various physiological occurrences during a menstrual cycle whereby upon adjusting said movable member to given locations on said cycle definite days may be assigned to said occurrences.

2,098,623
THEATER CHAIR
Merrill W. Hard, Los Angeles, Calif.
Application July 24, 1935, Serial No. 32,899
15 Claims. (Cl. 155—115)

10. A chair comprising a pair of pedestals, a pair of upright standards pivotally mounted at

their lower ends on said pedestals, side members pivotally supported on the upper ends of said standards, a seat pivotally connected to said side members, a pair of upright links forward of said



standards pivotally connected at their lower ends to said pedestals and at their upper ends to said side members, and means carried by said links for movably supporting said seat forward of said links.

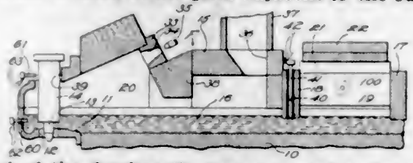
2,098,624

GLASS TRANSFER MECHANISM

George R. Haub, Zanesville, Ohio, assignor to Hazel-Atlas Glass Company, Wheeling, W. Va., a corporation of West Virginia

Application January 29, 1936, Serial No. 61,395
13 Claims. (Cl. 198—25)

1. Mechanism for transferring glass articles from a forming machine to the cups of a continuously moving glazer conveyer, including a continuously rotating escalator, vertically movable pads carried by the escalator, means for delivering glass articles from a forming machine to said escalator pads, the pads travelling in timed relation with the cups of a glazer conveyer, and means for delivering a glass article from an escalator pad and centering the article on a glazer cup.



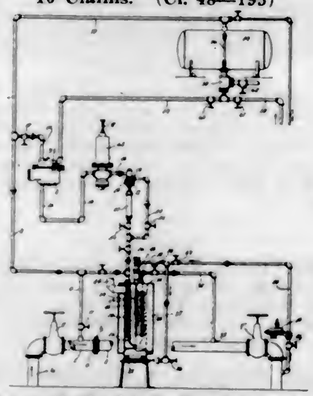
2,098,625

MEANS FOR AND METHOD OF CONTROLLING THE TEMPERATURE AND CONDITION OF GLASS IN A FOREHEARTH

William T. Honiss, West Hartford, Conn., assignor to Hartford-Empire Company, Hartford, Conn., a corporation of Delaware

Application January 5, 1934, Serial No. 705,348
9 Claims. (Cl. 49—55)

1. The combination with a forehearth adapted at one end to receive molten glass from a source of supply, said forehearth comprising separate cooling and heating chambers, the cooling chamber being located between the heating chamber and said source of supply of molten glass, said cooling chamber having adjustable heat radiation control means for controlling the amount of radiation of heat from the glass therein, a thermocouple located at the outer end of said cooling chamber, means operatively connecting said thermocouple with said heat radiation control means for adjusting the latter automatically under the control of the thermocouple, a burner for discharging liquid fuel and air into the space above the glass in the heating chamber, a thermocouple having a portion located in the glass adjacent to the outer



end of the forehearth, means operative by said second named thermocouple for automatically adjusting the amounts of both the liquid fuel and air discharging from said burner in accordance with the temperature of the glass in the proximity of said second named thermocouple, an additional thermocouple in position to be affected by a sting-out of flame from the outer end portion of the forehearth, and automatic means controlled by said last named thermocouple for independently varying the amount of liquid fuel supplied to said burner.

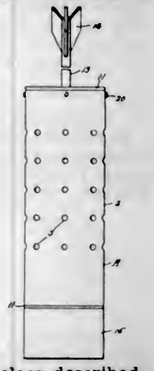
2,098,626

ODORIZING APPARATUS AND METHOD FOR GAS LINES

Frederic A. Hough, Pasadena, Calif.

Application September 22, 1931, Serial No. 564,456
10 Claims. (Cl. 48—195)

10. The method of injecting a liquid odorant into a gas line carrying a gas flowing under a pressure greater than atmospheric pressure, which consists in restricting the flow of gas in the pipe line to develop a differential pressure in the line before and beyond the restricted point, maintaining an elevated feed bath of the liquid to be injected, above the gas line and from which the atmospheric pressure is excluded, subjecting the horizontal upper surface of the feed bath to the static pressure of the line before the restricted point, maintaining a supply reservoir with a bottom opening at an elevation above that of the feed bath so that the liquid from the reservoir flows by the action of gravity down through the bottom opening to the feed bath, subjecting the horizontal upper surface of the liquid in the reservoir to the static pressure of the



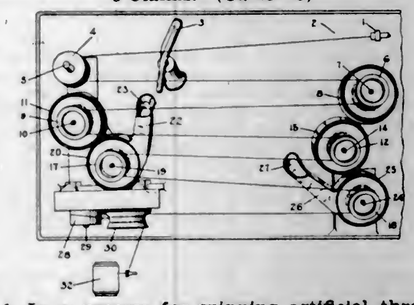
line before the restricted point, supplying liquid from the said bath to the gas line beyond the restricted point, and varying the flow from the feed bath in accordance with variations in the differential pressure.

2,098,627

AERIAL SHELL

Eugene Jeanis, Beaumont, Tex.

Application January 3, 1935, Serial No. 276
1 Claim. (Cl. 102—2)



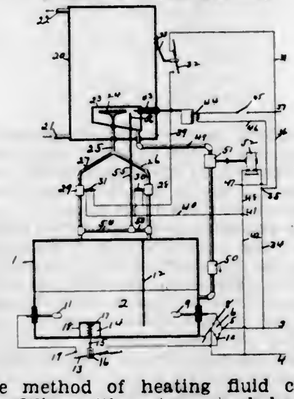
A device of the class described, comprising a cylindrical body, radially arranged barrels carried by the body for receiving cartridges, a cylinder removably fitting in the body for holding the cartridges in the barrels, means for removably holding the cylinder in the body, firing means carried by the cylinder for firing the cartridges, a hammer member slidably arranged in the cylinder for operating the firing means when the device strikes the ground, a casing at the lower end of the body and the hammer member having a part at its lower end for engaging the bottom of the casing, whereby when said bottom of the casing strikes the ground, the hammer member will move downwardly until said part, at its lower end, strikes the bottom of the casing, when further downward movement of the hammer member is stopped, a stem connected to the upper end of the hammer member and fins connected to the upper end of the stem.

2,098,628

ARTIFICIAL THREAD AND PROCESS OF PRODUCING SAME

George M. Karns, Kenmore, N. Y., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

Application December 18, 1935, Serial No. 55,060
6 Claims. (Cl. 18—8)



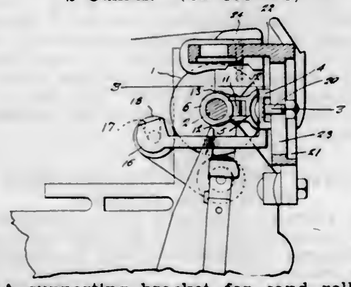
1. In a process for spinning artificial thread according to a wet spinning process, the steps which comprise extruding cellulosic solution into coagulating bath liquor, guiding the formed thread back and forth in the bath, directing a current of bath liquor across several portions of the thread in such a way that the influence of the current is weakest at the weakest portions of the thread, leading the thread out of the bath, then collecting the thread.

2,098,629

PRODUCTION OF GAS AND COMBUSTION THEREOF

Archer E. Knowlton, Short Beach, Conn.

Application June 13, 1935, Serial No. 26,495
9 Claims. (Cl. 204—5)

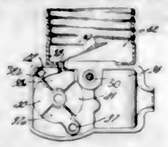


1. The method of heating fluid comprising partially filling with water a tank having electrodes in the water and a partition above the water and extending thereinto and between the electrodes, conducting electricity to the electrodes to separate the water into hydrogen and oxygen, collecting the gases separately on opposite sides of the partition, leading the gases to a burner within a closed chamber surrounded by the fluid to be heated, igniting the gases at the burner, controlling the flow of gases to the burner in accordance with the heating of the fluid, controlling the flow of electricity to the electrodes in accordance with the pressure of the gases in the tank, and returning the products of the combustion to the tank.

2,098,630

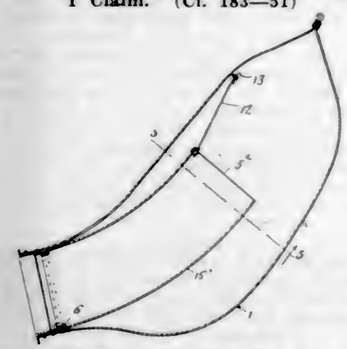
SELF-ALIGNING SAND ROLLER BEARING

William P. McGaha, Greenville, S. C., assignor of one-half to J. W. Sanders, Greenville, S. C.



Application June 29, 1936, Serial No. 88,037
2 Claims. (Cl. 308—15)

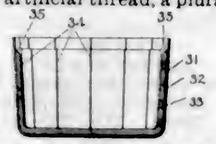
1. A supporting bracket for sand rolls of a loom comprising a base plate having slotted openings for adjustably securing the plate to the breast beam of the loom, a hollow cylindrical



boss projecting from one surface of the plate providing a swivel support for mounting a bearing bracket on said plate and a roller supporting arm extending from said plate, said roller supporting arm being adapted to support a guide roller and said bearing bracket being adapted to support a sand roll in cooperating engagement with the guide roller.

2,098,631
ELECTRIC LIGHTING FIXTURE
Anthony J. Parissi, Cohoes, N. Y.
Application May 12, 1933, Serial No. 670,715
3 Claims. (Cl. 173—346)

1. An electric lighting fixture comprising a lamp socket having two contacts adapted to engage the contacts of an incandescent lamp received therein, a switch, and three terminals electrically insulated from each other, two of said terminals being electrically connected directly to respective lamp socket contacts whereby said socket may be connected directly across two legs of an electric lighting circuit, and the third terminal being electrically connectible through said switch to one of said socket contacts; said terminals being arranged to permit the connection of said fixture in an external electric circuit.

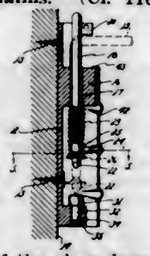


2,098,632
DUST BAG FOR VACUUM CLEANERS
Lee N. Parks, Caro, Mich.
Application May 18, 1937, Serial No. 143,372
1 Claim. (Cl. 183—51)

A conduit forming attachment for a dust bag comprising a tube of flexible material, a collar connected to one end of the tube and having spikes for engaging with the mouth of a bag and a member connected with the other end of the tube for holding the same in raised position in the bag.

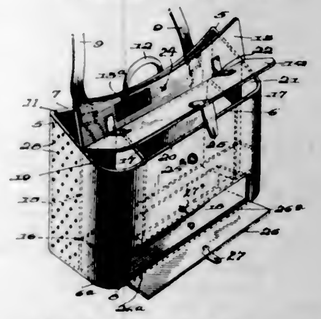
2,098,633
APPARATUS FOR THE PRODUCTION OF ARTIFICIAL THREAD
Ovid S. Petrescu, Nashville, Tenn., assignor, by mesne assignments, to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
Application September 26, 1934, Serial No. 745,575
1 Claim. (Cl. 117—27.5)

In a centrifugal bucket for the production and treatment of a bucket cake, an imperforate side wall, the thread-contacting surface of which is composed of a substance which is substantially inert to liquids used in the production and treatment of said artificial thread, a plurality of axially



extending grooves in the said side wall surface thereof, and narrow slits connecting the said grooves with the thread-contacting surface of said side wall.

2,098,634
SASH BALANCE
David Rosenthal, Ellenville, N. Y.
Application April 11, 1935, Serial No. 15,917
5 Claims. (Cl. 16—215)

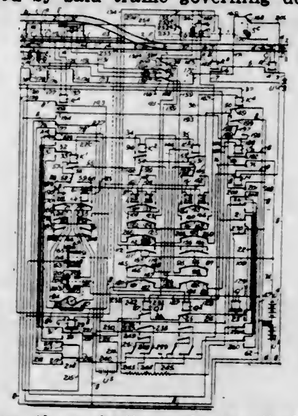


1. A sash pulley comprising a rectangular prismatic casing formed of two side faces, top and bottom faces, a closed end and an open end opposite thereto, a pulley rotatably mounted between said side faces having a portion thereof projecting beyond said casing through said open end, a slot in the bottom face of said casing near the closed end adapted to permit the passage of a flexible member over said pulley, an attaching flange extending downwardly in the plane of one of said side faces and below said bottom face, and a second attaching flange extending perpendicularly from the second side face and in the plane of said top face.

2,098,635
CLOSURE ALARM
Fred M. Schultz, Detroit, Mich.
Application April 27, 1936, Serial No. 76,616
2 Claims. (Cl. 116—89)

2. A device of the class described, comprising: a supporting member; an engagement member carried by said supporting member, adapted for the reception of an explosive cap; an exploding plunger adapted for movement into engagement with said cap, for exploding the same; a spring for moving said plunger into exploding position; means for releasably locking said plunger in cocked position against the compression of said spring; a housing for enclosing said engagement member, said housing being movable on said supporting member to position for uncovering said engagement membe.; and means on said housing adapted upon movement of said housing to uncovering position for preventing the release of said locking means.

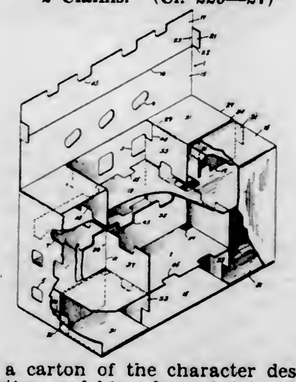
2,098,636
FISH AND TACKLE BASKET
William E. Smith and Irvine J. Focht, Wellsboro, Pa.
Application July 24, 1936, Serial No. 92,460
7 Claims. (Cl. 43—31)



1. A combined fish and tackle container for fishermen comprising in combination, a body having front, rear, side and bottom walls, and open at the top, a longitudinally extending vertical partition connecting said side and bottom walls between the front and rear walls whereby to provide a rear fish compartment extending the full height and length of the container and open at the top, said partition also providing a front tackle-receiving area in said container, means providing laterally spaced vertical partitions engaging said first-mentioned partition and abutting the front wall of the container whereby to reinforce the same and said first-mentioned partition and provide tackle-receiving compartments, separate swingable closures for said tackle and fish compartment portions of said container, and a common hinge means for said closures carried by said first-mentioned partition adjacent the second-mentioned partitions, the latter serving to reinforce the first-mentioned partition at the site of said hinge means.

2,098,637
SERUM TREATMENT FOR MANGE
Hugh J. Tingley, Winnipeg, Manitoba, Canada
No Drawing. Application January 13, 1936, Serial No. 58,985
3 Claims. (Cl. 167—53.2)

1. The process of producing a serum for the subcutaneous treatment of mange in canines consisting of the extraction of fluid from the amnion and allantois of bitches at the time of the performance of a Caesarean section or at normal parturition, the said amniotic and allantoic fluids being afterwards combined with a percentage of a saline and with phenol, said composition being afterwards filtered.

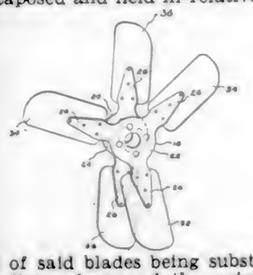


2,098,638
RAILWAY TRAFFIC CONTROLLING APPARATUS
Herbert A. Wallace, Edgewood Borough, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application July 29, 1926, Serial No. 125,659
Renewed September 11, 1930
112 Claims. (Cl. 246—3)

1. In combination, a stretch of railway track, a plurality of traffic governing devices for said stretch separately controlled from a distant point, a plurality of polarized relays located at such point and requiring currents of different magnitudes to energize the relays, a source of energy for supplying current to all said relays, means controlled by said traffic governing devices for

controlling the polarity and magnitude of the current supplied to said relays, and a plurality of indicators located at such distant point and selectively controlled by said relays.

2,098,639
CARTON
Edwin A. Walther, Sandusky, Ohio, assignor to The Hinde and Dauch Paper Company, Sandusky, Ohio, a corporation of Ohio
Application November 15, 1935, Serial No. 49,980
2 Claims. (Cl. 229—27)



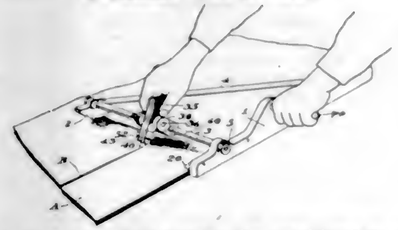
1. In a carton of the character described, in combination, end-hinged panels laterally divided, cover flaps substantially equal in width to the width of said divisions and adapted when folded to overlie said panels, a tuck on each of said flaps, said tucks being adapted to pass down between the adjacent edges of said panels, and lock tabs hinged to said tucks at a right-angle to the flap-tuck bend line and having an edge substantially in the plane of said line.

2,098,640
FAN CONSTRUCTION
Beecher B. Cary, Jackson, Mich., assignor to Hayes Industries, Inc., Jackson, Mich., a corporation of Michigan
Application May 15, 1936, Serial No. 79,949
1 Claim. (Cl. 170—165)

A rotary fan for automobiles and the like comprising a pair of fan units each having individ-

ual central spider structures, one of said units having an odd number of equally spaced blades, the other of said units having an even number of equally spaced blades, said spider structures being juxtaposed and held in relatively fixed re-

lation, all of said blades being substantially coplanarily disposed around the axis of rotation and so arranged that the angles between adjacent blades are all different, said units being individually and collectively in static balance.



2,098,641

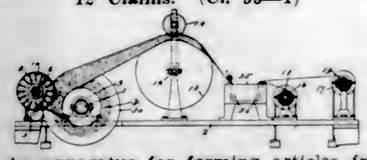
STRIP CUTTER

Jerome E. Cook, Larchmont, N. Y., assignor to Bigelow-Sanford Carpet Co. Inc., Thompsonville, Conn., a corporation of Massachusetts

Application April 15, 1936, Serial No. 74,397

2 Claims. (Cl. 30—293)

1. In a rug strip cutter, the combination of a gauge adapted to abut the edge of the rug to be cut, a presser member adjacent the gauge adapted to bear on the upper surface of the rug adjacent the said edge, a second presser member, means connecting the two presser members to space the second presser member a predetermined distance from the first presser member, a blade holder and means for mounting the blade holder on said connecting means intermediate said presser members, the said blade holder being pivotally mounted to afford a free swinging movement of the blade toward and away from the work as the cut progresses.



2,098,642

METHOD AND MEANS FOR FORMING ARTICLES FROM PAPER

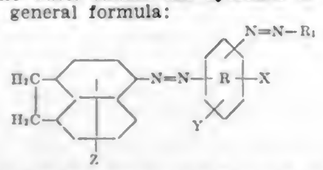
Harold E. Cude, Manchester, Conn.; Agnes Hall Cude, Manchester, Conn., administratrix of Harold E. Cude, deceased

Application July 30, 1936, Serial No. 93,386

12 Claims. (Cl. 93—1)

1. An apparatus for forming articles from a continuous strip of material which comprises means for supplying said strip of material, a rotatable mandrel about which the strip is to be wound, means for rotating said mandrel, disks rotatable in frictional contact with opposite faces of the mandrel for in cooperation therewith drawing the strip and folding it over the periphery of the mandrel, means for initially scoring the strip as it passes to the mandrel, and means for treating the strip with a binding compound as it feeds.

2,098,643



WATER-SOLUBLE AZO-DYESTUFFS

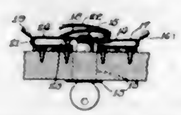
Erich Fischer, Bad Soden-on-Taunus, and Richard Huss, Frankfort-on-the-Main, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application June 26, 1936, Serial No. 87,586. In Germany June 29, 1935

5 Claims. (Cl. 260—76)

1. The water-soluble azo-dyestuffs of the following general formula:

wherein the benzene nucleus R contains at least two hydroxy groups, R_1 means a member of the group consisting of radicals of the benzene, naphthalene, diphenyl and acenaphthene series, X stands for one of the group consisting of hydrogen and the radical —N=N—R_1, Y for one of the group consisting of hydrogen, sulfonic acid and carboxylic acid, Z stands for one of the group consisting of hydrogen and sulfonic acid, and wherein the dyestuff contains at least one sulfonic acid group, being yellow-brown to black-brown powders which are soluble in water and dye leather yellow-brown to black-brown shades of good fastness properties.



2,098,644

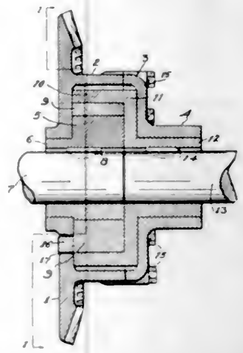
SWITCH

James M. Gleason, Chicago, Ill., assignor to Morris B. Sachs, Chicago, Ill.

Application August 15, 1934, Serial No. 739,863

7 Claims. (Cl. 200—44)

1. A switch comprising a pair of contacts normally maintaining a circuit through themselves by mutual contact and supported on a surface in spaced apart relation thereto, a rotatable shaft perpendicular to said surface having an insulator finger fixed thereon constructed and arranged to be rotated between said surface and said contacts in one direction of rotation, means for causing the insulator to ride up over the outside surface of said contacts when rotated in the opposite direction, and arcuate resilient extensions on said contacts constructed to be overridden by said insulator during said opposite rotative movement, the extension most remote from said surface being shorter than the other providing a space for admitting the insulator between said extensions.



2,098,645

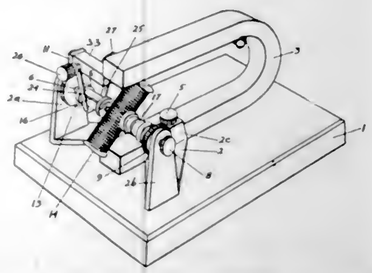
POWER DRIVE FOR MOTOR VEHICLE AXLES

Edwin J. Gould, Oakland, Calif., assignor to Cora Gould Harvey, Alameda County, Calif.

Application July 1, 1935, Serial No. 29,298

5 Claims. (Cl. 74—389.5)

1. A power drive for motor vehicles of the class described comprising two axles in alignment with each other, an eccentric member fixed to one of said axles, a wedging eccentric member mounted on said eccentric member, a concentric drum mounted on said eccentric wedging member and being fixed to the other of said axles, a drive member having a drum forming part of an inclosing housing, a drum member forming the other part of the inclosing housing, an opening in the side of the drive member, and a projecting member on said wedging eccentric member adapted to project into said opening.



2,098,646

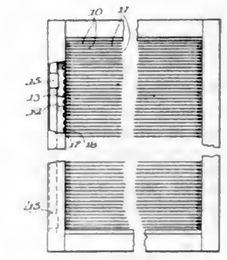
EDUCATIONAL APPARATUS

Ervin Holbrook Lewis, Boston, Mass., assignor to Cambosco Scientific Company, Waverley, Mass., a corporation of Massachusetts

Application August 8, 1935, Serial No. 35,240

16 Claims. (Cl. 35—19)

1. An electric motor and generator device for educational purposes including a field magnet, an armature, a base and an armature supporting and field magnet positioning member secured to said base and having a substantially U-shaped portion in the plane of the base, said U-shaped portion carrying means for positioning said field magnet and said member having parallel arms extending perpendicularly to said plane, said arms being adapted rotatably to support said armature shaft parallel to said base.



2,098,647

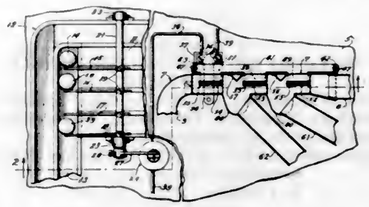
ELECTROCUTING TRAP

Edward A. Lindsley, Chicago, Ill., assignor to National Electric Screen Co., Chicago, Ill., a corporation of Illinois

Application June 11, 1936, Serial No. 84,621

8 Claims. (Cl. 43—112)

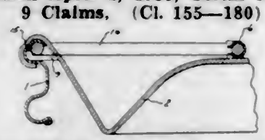
6. An electrocuting trap including straight bars providing spaced electrodes, said electrodes being spaced with respect to their diameters so that corona may form between said electrodes, enlargements respectively providing supports for said bars, the enlargement of one electrode being spaced from the enlargement of an adjacent electrode and being of a different diameter than said electrodes, the ratio of the diameters of said enlargements to the spacing between said enlargements being such that corona cannot form on said enlargements.



2,098,648

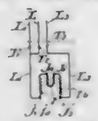
BALL CONTROL MECHANISM FOR PINBALL GAMES

Bert E. Mills, Oak Park, Ill., assignor to Mills Novelty Company, Chicago, Ill., a corporation of Illinois



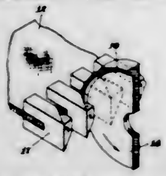
Application December 24, 1934, Serial No. 758,910

9 Claims. (Cl. 273—118)



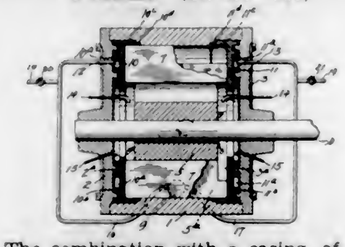
1. In a pin ball game the combination with a playing board, of a downwardly inclined guide chute positioned to receive balls rolling from the board, a downwardly inclined ball runway, a series of movable stop members spaced along said runway in the path of movement of a ball thereon, and electrically operated means for moving said members away from and back to ball obstructing position on the runway, said means including an energizing circuit having a plurality of switch arms spaced along said guide chute in position to be successively actuated by a ball advancing thereon, and means for retarding advance of the actuating ball along said chute after making contact with one of said arms and before contacting the next succeeding arm, whereby to allow time for return of said stop members to ball obstructing position between successive closings of the energizing circuit.

2,098,649
BOTTOM STRIP SEAT FRAME CONNECTION
Donald E. Sargent, Jackson, Mich., assignor to Reynolds Spring Company, Jackson, Mich., a corporation of Delaware
Application April 1, 1935, Serial No. 14,039
9 Claims. (Cl. 155—180)



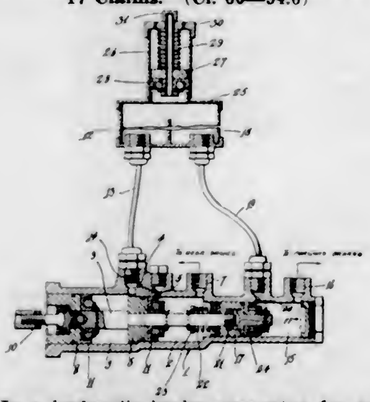
4. A combination of a bottom strip, three tongues disposed in substantial alignment on one end thereof, and a frame having a laterally extending channel receiving the two outer tongues, the center one of said tongues overlapping at least one side of and the back of said channel.

2,098,650
TEMPERATURE MEASURING SYSTEM
Irving M. Stein, Philadelphia, Pa., assignor to Leeds & Northrup Company, Philadelphia, Pa., a corporation of Pennsylvania
Application November 27, 1935, Serial No. 51,822
9 Claims. (Cl. 73—32)



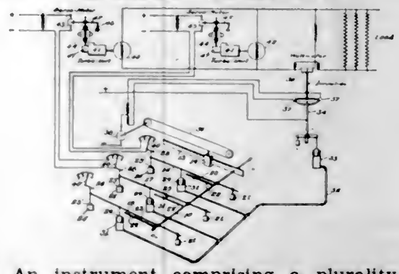
1. A detector for a resistance thermometer comprising a conductor having a substantial positive temperature coefficient of resistance and which is conductive at ordinary temperatures and a standardizing conductor having a low temperature coefficient of resistance and the ratio of whose resistance to the total resistance of the detector is such that said detector has a standard temperature coefficient of resistance, one of said conductors divided into components between which the other conductor is connected.

2,098,651
METHOD OF MAKING SEPARABLE FASTENERS
Gideon Sundback, Meadville, Pa., assignor to Hookless Fastener Company, Meadville, Pa., a corporation of Pennsylvania
Application August 8, 1933, Serial No. 684,237
Renewed August 22, 1935
8 Claims. (Cl. 18—59)



1. The method of making stringers for separable interlocking fasteners which comprises forming an elongated strip of material with a series of uniformly spaced teeth, said teeth having aligned slots to receive the edge of a flexible support and a portion projecting from the support, attaching said strip to a flexible support, and carving from said projecting portion a series of spaced elements each having a projection and a recess for interlocking with projections and recesses of cooperating elements.

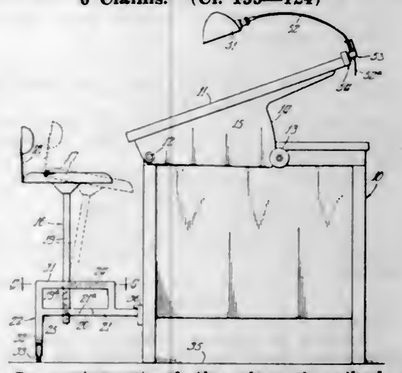
2,098,652
ROTARY PUMP
John Calvin Buckbee, Los Angeles, Calif.
Application August 13, 1935, Serial No. 35,967
3 Claims. (Cl. 103—136)



1. The combination with a casing, of a rotor, vanes radially slidable in said rotor, said rotor and vanes being shorter than the distance between the casing heads, annular members freely seated in the spaces between the rotor and the casing heads and concentric therewith to provide within the inner periphery of the annular members a cylindrical space for receiving a lubricating medium, there being in each annular member an annular groove for receiving a pressure medium to maintain the annular members pressed against the rotor ends, and means for sealing said grooves to prevent pressure medium leakage around the annular members.

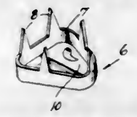
2,098,653
HYDRAULIC BRAKE APPARATUS
Eugene G. Carroll, Los Angeles, Calif., assignor, by mesne assignments, to Bendix Brake Company, South Bend, Ind., a corporation of Illinois
Application April 16, 1928, Serial No. 270,286
17 Claims. (Cl. 60—54.6)

1. In a hydraulic brake apparatus for applying brakes by the actuation of a pedal, the combination of a master cylinder having a chamber of a given diameter and a chamber of relatively larger diameter, a piston mounted in the smaller chamber and a piston mounted in the larger chamber, and having means for connecting the same with the brake-pedal, said pistons being connected to move in unison, an unobstructed by-pass connecting the said chambers, with a port opening through the wall of the smaller chamber at such a point that it is traversed by the smaller piston in its movement, and means for connecting the relatively small chamber to the brakes, the piston in the relatively large chamber operating, when moved forwardly, to maintain the pressure in the smaller chamber while the smaller piston is crossing the said port.



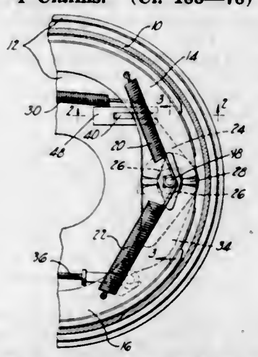
2,098,654
LOAD ALLOCATING DEVICE
Wilber A. Carter, Detroit, Mich.
Application July 21, 1932, Serial No. 623,834
18 Claims. (Cl. 290—4)

1. An instrument comprising a plurality of mechanisms connected in parallel relation to a load to each carry a portion of such load with different load carrying characteristics, said device comprising a rotatable shaft, an arm secured to the shaft, a weight supported slidable on said arm, a plurality of arms pivoted on said shaft for movement thereon, yieldable means interconnecting the arms to the shaft containers, fluid in said containers, and bodies movable in said fluid connected to said yieldable arms to oppose movement of said shaft by said weight on its supporting arm.



18. In combination, a group of energy transforming units connected in parallel to a transmission system, a plurality of movable secondary control means each of which is connected to control energy flow in a unit, respectively, a master control means responsive to variations in the system load and connected with said secondary control means, and a plurality of means, each simulating desired characteristics of a transforming unit connected to selectively affect movement of said master control means.

2,098,655
WORK EQUIPMENT
Harold L. De Lisle, Two Rivers, Wis.
Application January 28, 1935, Serial No. 3,698
6 Claims. (Cl. 155—124)

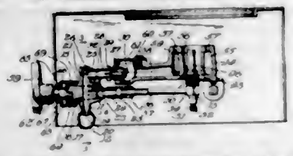


5. In equipment of the class described, the combination including a table, a chair base associated with the table, a track for the chair base along the table front providing a guide for parallel movement of the chair base with respect to the table at a uniform distance therefrom, said track being carried solely by the table spaced upwardly from the floor, anti-friction means carried by the chair base and bearing on the track supporting the chair base and permitting said movement of the base, said chair base having at least three points of support being supported on the floor at a point spaced from the table and being otherwise unsupported except by a cantilever support on said track, and a seat carried by the base and movable on the base toward and from the table.

2,098,656
TOY ANIMAL NOSE PIECE
Arthur A. Gerling, New York, N. Y.
Application May 8, 1937, Serial No. 141,397
3 Claims. (Cl. 46—164)

1. In combination with a toy animal head having a foundation of stuffed fabric, a metallic nose-piece therefor, the said nose piece comprising a cupped shell and bendable prongs extending from the said shell, the said prongs penetrating and being bent about the head material for securing the said nose-piece in place.

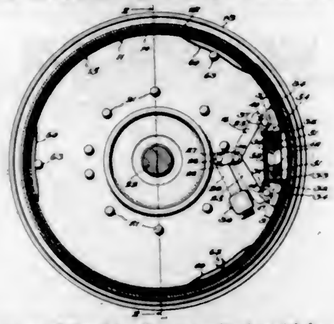
2,098,657
BRAKE
Rudolph A. Goepfrich, South Bend, Ind., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application December 21, 1935, Serial No. 55,527
4 Claims. (Cl. 188—78)



1. A brake comprising a backing plate having friction means mounted thereon and provided with an anchor between the ends of the friction means, an operating lever formed and arranged to float relatively to said anchor circumferentially of the brake and having thrust parts acting on said ends and having portions extending on opposite sides of said anchor, a second lever mounted on the anchor and having a part in thrust engagement with one of the portions of the operating lever and having actuating means extending through the backing plate, and an auxiliary lever extending through the backing plate and having one end acting on the other of said portions and having actuating means connected to its other end.

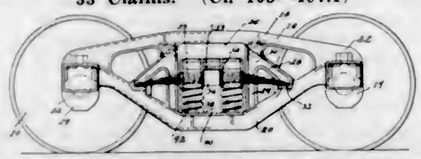
2,098,658
SYRINGE
John T. Goltman, Clinton, and John W. Robbins, Davenport, Iowa, assignors to Applicator Products Corporation, Clinton, Iowa, a corporation of Iowa
Application February 28, 1935, Serial No. 8,604
6 Claims. (Cl. 128—231)

1. In a device of the kind described, an exterior tube, an interior tube secured in said exterior tube and having its walls spaced from the walls of said exterior tube, and means to prevent liquid from said exterior tube entering said interior tube, said means comprising a reciprocating plunger inclosed within said exterior tube and adapted to reciprocate between the walls of said tubes and form a closure for said interior tube.



2,098,659
GAS BURNER
Philip S. Harper, Chicago, Ill.
Application July 2, 1936, Serial No. 88,520
2 Claims. (Cl. 158—105)

1. In combination, a gas valve having a single inlet and having two outlets, one above the other and substantially parallel with each other, the upper of said two outlets having a restricting orifice, a gas burner comprising an annular burner section having a central hole therethrough and a mixing tube connecting therewith, said upper outlet of said valve slidably projecting into the said mixing tube, said burner having means allowing for admission of air to said mixing tube, a tubular extension rigidly connecting with the lower of said outlet projections and extending horizontally therefrom below the mixing tube of said annular burner to a point below the central hole of said burner, said tubular extension connecting with a vertically disposed warming burner which extends upwardly within the central hole of the said annular burner section, the outer wall of said warming burner being spaced from the inner wall of said annular burner so as to allow for adequate upward flow of secondary air to both burners, said warming burner being adequately supported by said lower outlet, said gas burner being free from rigid connection with said warmer burner, said warming burner having a restricting gas discharge orifice discharging upwardly into a vertical mixing tube, the warming burner having air opening means in the vertical mixing tube above said gas discharging orifice in order to allow for admission of primary air into the warming burner.



2,098,660
BRAKE
Jesse G. Hawley, Painted Post, N. Y., assignor to Hawley-Jones Corporation, Riverside, N. Y., a corporation of New York
Application February 2, 1932, Serial No. 590,481
5 Claims. (Cl. 188—78)

1. In a brake, the combination of a brake cover, a drum relatively movable with respect thereto, a creeping brake lining for engagement with the drum, a flexible brake shoe for cooperation with the brake lining, a toggle member for ex-

panding said brake shoe against said brake lining, and means which at all times exert an outward thrust on portions of the brake shoe remote from its ends.

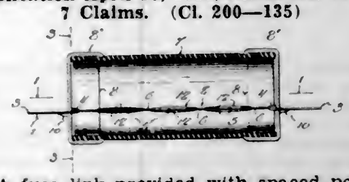
2,098,661
TRUCK
William C. Hedgcock, Chicago, Ill., assignor to American Steel Foundries, Chicago, Ill., a corporation of New Jersey
Application November 10, 1933, Serial No. 697,379
33 Claims. (Cl. 105—197.1)

1. In a truck, the combination of a side frame, spaced wheel and axle assemblies, said side frame including tension and compression members merging adjacent the ends thereof and provided with journal means cooperating with the journal ends of said wheel and axle assemblies, spaced integral connecting columns forming a window with said tension and compression members, spring seats on one of said last-named members, a resilient member between said seats, a load carrying member extending into said window and supported on said resilient member, and means on said side frame cooperating with said resilient member to load said resilient member to thereby increase the amount of energy said resilient member will absorb.

2,098,662
COPYING PAD AND METHOD OF PREPARING SAME
William Hoskins, Jr., La Grange, Ill., assignor to Ditto, Incorporated, Chicago, Ill., a corporation of West Virginia
No Drawing. Application May 23, 1936, Serial No. 81,513
15 Claims. (Cl. 41—31.6)

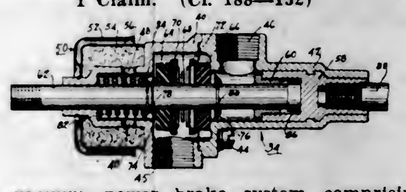
1. A copy pad comprising a backing, a copy mass and an intermediate bonding layer of a sulphonated oil.

2,098,663
LIQUID PASTEURIZING APPARATUS
Andrew B. Juhasz, Norwalk, Conn.
Application April 23, 1936, Serial No. 76,014
4 Claims. (Cl. 219—38)



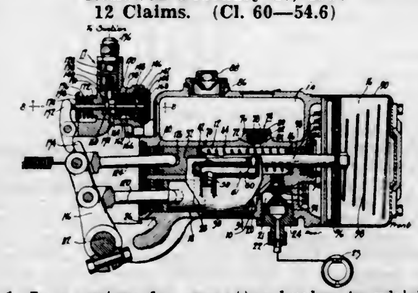
1. A pasteurizing apparatus of the class described comprising a heating chamber including

an electric heating unit, a liquid receptacle movably supported in said chamber, a removable distributing unit comprising a perforated base sup-



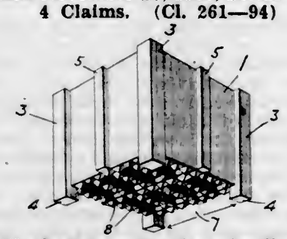
ported in spaced relation to the bottom of the receptacle and including a funnel to receive the liquid, and means for supplying liquid to the distributing unit.

2,098,664
ELECTRICAL FUSE LINK
Oscar H. Jung and Paul E. Heffelfinger, Milwaukee, Wis., assignors to Trico Fuse Mfg. Co., Milwaukee, Wis.
Application April 16, 1934, Serial No. 720,770
7 Claims. (Cl. 200—135)



1. A fuse link provided with spaced potential fusible portions and an enlarged intermediate area, the surface of the intermediate portion being coated with a material which is an electrical non-conductor, and at the same time a heat conductor, the thickness of the coating being gradually reduced to nothing toward the edges of the coated area.

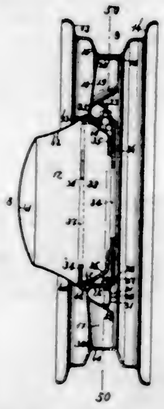
2,098,665
BRAKE
Victor W. Kliesrath, South Bend, Ind., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application April 24, 1936, Serial No. 76,119
1 Claim. (Cl. 188—152)



A vacuum power brake system comprising brakes, a power cylinder, connections between the power cylinder and the brakes, means for connecting one end of the power cylinder constantly with the atmosphere, a source of suction, means for at will controlling fluid connection to the other end to the power cylinder to connect said end either to the source of suction or to the atmospheric as desired, said means for controlling the connection to the power cylinder comprising a valve, and said valve comprising a casing formed with a forward end and a rearward end, formed with an opening adjacent to the forward end connected with the atmosphere, formed with an opening adjacent to the rearward end connected with said source of suction, formed with a pair of valve seats interposed between said openings, formed with an opening intermediate said seats arranged to be connected with said power cylinder, and formed at its forward end with a central bore, and provided with a pair of substantially uniform size valve elements also interposed, a stem extending into said casing through said central bore and provided with an enlargement at its rearward end and with three annular rings, two of which are arranged at times to contact with said valve elements to move said valve elements from sealing engagement with their associated seats, and connected outside of said casing with a member for operating said stem whereby one or the other said valve elements may be moved from its associated seat or both of said elements may be allowed to rest upon their associated seats, a spring interposed between said valve elements and urging both of them toward their respective seats, a spring interposed between the forward end of said casing and said third ring, an air cleaner associated with said atmospheric opening, and a pair of plugs secured within the rearward end of said casing against which the enlargement of the stem is at times arranged to bear so as to move the casing in either direction as desired.

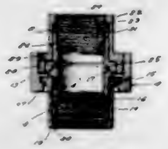
2,098,666
BRAKE
Ludger E. La Brie, Detroit, Mich., assignor to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application October 15, 1932, Serial No. 638,017
Renewed February 17, 1937
12 Claims. (Cl. 60—54.6)

1. In a system for operating brakes in which a hydraulic fluid is utilized, means for applying said brakes responsive to increases in pressure in the hydraulic fluid, vacuum operated means for applying pressure to said fluid, manually operated means for applying pressure to said fluid, a foot pedal, a lever associated with said pedal and formed with a projection, a valve, a pivoted lever normally adapted to contact with said projection and with a portion of said valve and means whereby movement of said pedal to apply said brakes releases the contact of said pivoted lever with said valve.



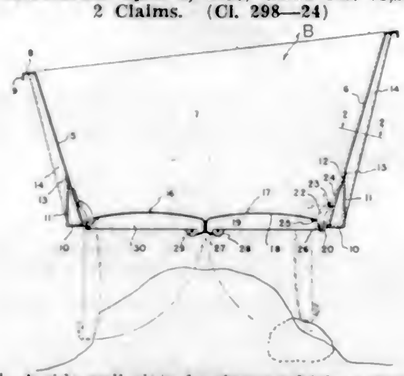
2,098,667
DRIP POINT GRID TILE
Fred M. Miller, Bala-Cynwyd, Pa.
Application November 27, 1936, Serial No. 112,881
4 Claims. (Cl. 261—94)

1. A tile having supports extending from its lower face so as to space said lower face above the



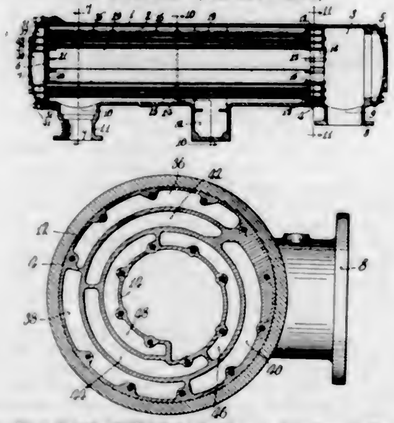
means supporting the tile, said tile having therein perforations extending vertically through said tile, and downwardly extending pointed projections surrounding the lower ends of said perforations.

2,098,668
VEHICLE WHEEL
Richard B. Miller, Brooklyn, N. Y., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application October 30, 1933, Serial No. 695,821
1 Claim. (Cl. 301—64)



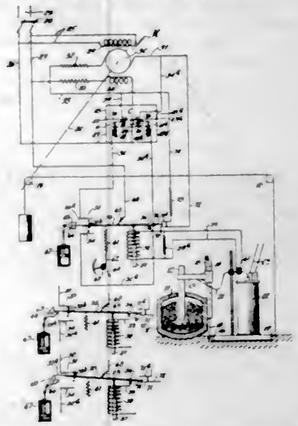
A wheel assembly including a wheel body member, a tire-rim carried by said wheel body member, an annular wall extended radially-inwardly of the wheel body and merged with an annular flanged body having a central opening, a bolting-on member engaged with said flanged body and having cover member engaging means, and bracing members at the inboard side of the wheel body member adapted for stiffening the wheel body member radially and axially.

2,098,669
PIPE UNION
Walter S. Moffitt, Warwick, R. I.
Application June 1, 1936, Serial No. 82,705
1 Claim. (Cl. 285—124)



In a pipe union, two outer shells each having outwardly turned annular flanges at one end and inwardly turned annular flanges at the other end, each shell having elongated cylindrical members of non-corrodible metal seated therein with one end of each non-corrodible cylinder abutted against the inwardly turned flange of its shell and the other ends of said cylindrical members being formed to provide engageable sealing surfaces, the flanges and the adjacent portions of the cylindrical members having a continuous screw thread, and means engaging the outer flanges to detachably lock the shells and the cylindrical members together.

2,098,670
DUMP BODY
Ralph T. Osman, Milwaukee, Wis.
Application April 8, 1936, Serial No. 73,296
2 Claims. (Cl. 298—24)

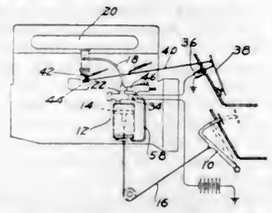


1. A side wall plate for dump vehicles comprising, an inclined body portion, a laterally extending flange formed on the upper edge of the body portion, a laterally and outwardly extending horizontal bottom wall portion formed on the lower edge of the body portion, an upwardly and vertically extending reinforcing plate portion formed on said bottom wall portion, said reinforcing wall portion having its upper edge extending into abutting relation with the outer surface of the body portion, said edge being welded to the outer surface of the body portion, and reinforcing ribs welded to said body portion, said ribs being extended into intimate abutting engagement with the top flange and the side reinforcing plate portions.

2,098,671
HEAT EXCHANGE DEVICE
Win W. Paget, Michigan City, Ind., assignor to Sullivan Machinery Company, a corporation of Massachusetts
Application January 5, 1937, Serial No. 119,124
10 Claims. (Cl. 257—240)

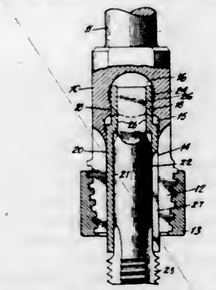
6. In a heat exchange device, a horizontal shell, means arranged within said shell providing a substantially spiral passage for the fluid to be cooled, tube headers constituting the ends of said fluid passage, said headers having formed therein cooling liquid spaces corresponding generally to the convolution of the fluid passage, and substantially horizontal cooling tubes connected with said liquid spaces and extending longitudinally through said fluid passage, said liquid spaces each divided by partitions so disposed that liquid admitted to one of the liquid spaces will flow successively across through some tubes and back through others in zig-zag fashion and in a generally counter-current direction in relation to the fluid flowing through the fluid passage.

2,098,672
AUTOMATIC ELECTRIC ARC FURNACE ELECTRODE CONTROL
William Harvey Payne, La Grange, Ill.
Application November 2, 1936, Serial No. 108,739
8 Claims. (Cl. 13—13)



1. In combination with an electric furnace having a movable arcing electrode and a support therefor and a current-carrying conductor for said electrode, a reversible prime mover adapted to raise and lower said electrode to maintain an arcing gap of desired length, a control circuit responsive to variations in the current flowing through the electrode, motor circuits for imparting raising and lowering movements to the prime mover, a contact making device responsively actuated by current variations in the control circuit and adapted to stand in open circuit breaking relation to both motor circuits when the electrode current is flowing at substantially normal rate and to close one or the other of the motor circuits when the electrode current varies from set normal, and damping means for retarding the movements of the contact making device only when moving in either direction through an intermediate range on either side of and including the neutral position and being entirely undamped in the circuit closing and breaking positions.

2,098,673
SURGICAL BASIN
James C. Pollock, Lansdale, Pa.
Application August 19, 1936, Serial No. 96,729
13 Claims. (Cl. 128—275)

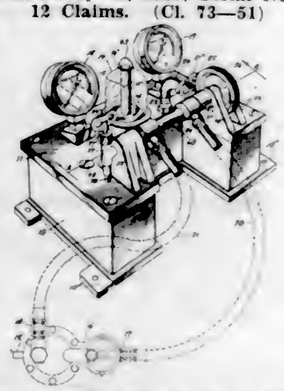


1. A surgical basin having a pan portion, a lateral portion extending beyond the pan portion and serviceable as a rest surface at the level of the pan top for supporting the head or other part of the body, and a wall which recedes downwardly and inwardly from the inner edge of the rest surface to the pan bottom.

2,098,674
CLUTCH CONTROL MECHANISM
Harold W. Price and Earl R. Price, South Bend, Ind., assignors to Bendix Aviation Corporation, South Bend, Ind., a corporation of Delaware
Application November 27, 1931, Serial No. 577,659
4 Claims. (Cl. 192—.01)

1. A clutch operating mechanism for an automotive vehicle provided with an internal-combustion engine having an intake manifold and further provided with a clutch, said operating mechanism comprising a vacuum operated double-ended fluid motor and a control valve for said fluid motor, and valve means connected to the compression side of said motor and also connected to said manifold, said valve adapted to control the clutch engaging function of said motor, said valve being operable in accordance with the degree of manifold vacuum to determine the rate of efflux of air from the compression side of said motor.

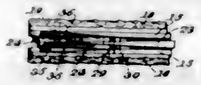
2,098,675
TOOL-HOLDING CHUCK AND COLLET THEREFOR
Harry G. Procunier, Chicago, Ill., assignor to Procunier Safety Chuck Company, Chicago, Ill., a corporation of Illinois
Application February 15, 1936, Serial No. 64,058
3 Claims. (Cl. 279—42)



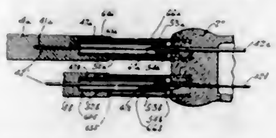
1. A chuck for tools having cylindrical shanks with flat ends, said chuck comprising a body having a longitudinal bore and a transverse cylindrical hole which intersects the end wall of the bore a chordal distance less than the diameter of the bore thereby forming diametrically opposite shoulders at the inner end of the bore, said shoulders having their opposed edge portions removed to form flat tool end engaging surfaces to provide driving connections between the chuck and tool, and means at the outer end of the chuck for clamping the tool therein.

2,098,676
BEAM AND THE LIKE FOR BUILDING CONSTRUCTION
Albert Rafter, Glen Ridge, N. J., assignor to Rafter Machine Company, Belleville, N. J., a partnership composed of Albert Rafter and John C. Rafter, Jr.
Original application May 16, 1936, Serial No. 80,089. Divided and this application December 4, 1936, Serial No. 114,150
3 Claims. (Cl. 189—37)

3. In a structural member for building construction, a pair of spaced plates provided with a plurality of spaced apertures, inwardly directed flanges surrounding said apertures and integral with said plates, the flanges on one plate being positioned within the flanges on the other plate, each of said plates having outwardly directed flanges bent back upon themselves, the free edge of one flange being bent over and around the free edge of the other flange to provide interlocking means to prevent separation of the plates.



2,098,677
PUMP TESTING APPARATUS
Erwin J. Saballus and John H. O. Saballus, Chicago, Ill., assignors to Joseph Weidenhoff, Inc., Chicago, Ill., a corporation of Illinois
Application May 23, 1935, Serial No. 22,997
12 Claims. (Cl. 73—51)

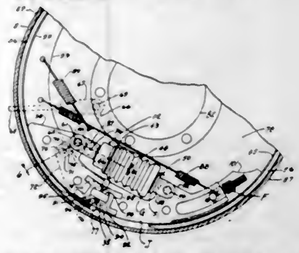


10. A unitary apparatus for testing pumps comprising, in combination, a liquid supply tank for storing liquid to be employed in the testing of the pumps, means forming a supply conduit for conducting liquid from the tank to the inlet of a pump to be tested, means forming a return conduit for conducting liquid from the outlet of such a pump back to the tank, means mounted on said tank and communicating with said supply conduit for indicating the suction created by the pump, means mounted on said tank and communicating with said return conduit for indicating the pressure created by the pump, and a shut-off device for each of said conduits mounted on the tank respectively adjacent the suction and the pressure indicating means and respectively actuated to render the suction or the pressure indicating means operable.

2,098,678
POCKET KNIFE
George Schrade, Bridgeport, Conn.
Application January 16, 1936, Serial No. 59,333
6 Claims. (Cl. 30—159)

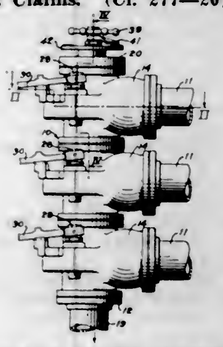
6. A knife of the class described including lining members, a back secured between the lining members forming a spring for the blade and a guide for a latch, a movable latch mounted between said lining members and against said guide of the back, a spring between the latch and the back, means to hold the latch in position against the guide, a blade pivotally mounted in the linings and having its free end portion disposed to engage and be locked by the movable latch, a longitudinal movable slide having an exposed finger piece upon one portion and means connecting another portion with the said latch to operate the same against the action of its spring to release the blade, the opposite inner face of the portion of the linings adjacent to the latch being cut away to allow the end portion of the knife blade to freely pass the engaging portion of the latch.

2,098,679
GASEOUS DISCHARGE DEVICE
Richard M. Somers, Orange, N. J., assignor to Thomas A. Edison, Incorporated, West Orange, N. J., a corporation of New Jersey
Application March 20, 1935, Serial No. 11,919
5 Claims. (Cl. 176—122)



1. In a gaseous discharge device having an envelope, a conductive rod passing through said envelope; an anode mounted on said rod; a refractory insulating bead about said rod and sealed to said envelope; and a refractory insulating tube surrounding said bead and rod and entering said anode.

2,098,680
FUSIBLE COUPLING FOR FIRE ALARM CIRCUITS
Glen D. Stauffer, Nappanee, Ind.
Application November 27, 1935, Serial No. 51,907
2 Claims. (Cl. 200—142)

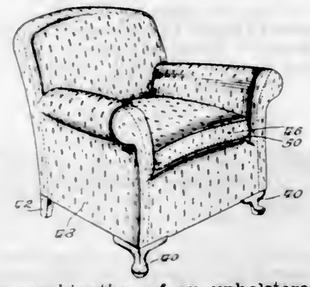


1. A fusible coupling comprising a relatively thick flat ring-like body of non-conductive, combustible material, said body having a central opening therein and openings through diametrically opposite sides thereof for communication with the central opening, a pair of terminals engaged within the diametrically opposed openings and having reduced inner ends extending into the central opening and spaced from each other, said terminals having longitudinal bores extending into the outer ends thereof for receiving line wires therein, fusible means for sealing said wires within the bores and fusible means in the form of a plug filling the central opening and encasing said reduced ends.

2,098,681
BRAKE
John W. Tatter, Detroit, Mich., assignor to Bendix Products Corporation, South Bend, Ind., a corporation of Indiana
Application May 12, 1932, Serial No. 610,827
Renewed April 19, 1937
20 Claims. (Cl. 188—106)

1. In a brake, the combination of a brake shoe member, a hydraulic cylinder mounted on the ends of said brake shoe member, a double arm lever member pivotally mounted on said hydraulic cylinder, an anchor pin engaging the ends of said brake shoe member, a member slidably mounted adjacent said anchor pin, said last mentioned member engaging said anchor pin together with the ends of said brake shoe member, and operating means connected with said double arm lever member.

2,098,682
SELECTIVE VALVE MANIFOLD FOR GASOLINE TANK TRUCKS AND THE LIKE
Howard E. Ward, Berkeley, Calif., and Walter W. Brown, Tuckahoe, N. Y., assignors to Ralph N. Brodie Company, Oakland, Calif., a corporation of California
Application August 12, 1936, Serial No. 95,672
3 Claims. (Cl. 277—20)

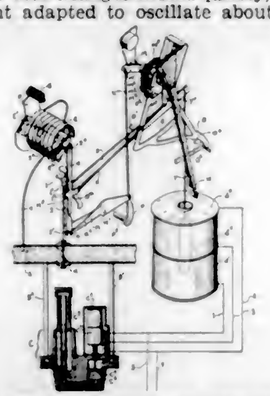


1. An apparatus of the character described comprising a manifold having a plurality of separate inlets and a common outlet, a separate valve to control each inlet and normally maintaining the same closed, a separate valve operating mechanism for each valve, each of said valve operating mechanisms including a valve operating member, a latching mechanism for each of said operating members normally latching said members in an inoperative position, said latching mechanisms including a selector shaft, a separate disk on said shaft for each latching mechanism, said disks each having a keeper slot, the keeper slots of said disks being relatively differently positioned, each latching mechanism including a latching lever associated with said operating member, each latching lever having a pin to cooperate with the keeper slot of the cooperating disk whereby when said keeper slot and pin are in alignment said operating member may be operated to open the valve.

2,098,683
BEARING
Harry E. Wise, Canton, Ohio
Application October 6, 1932, Serial No. 636,491
25 Claims. (Cl. 308—214)

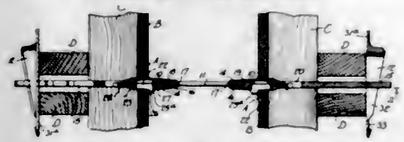
1. A tapered roller bearing comprising inner and outer races, rollers between the races, and circumferential pressure and guiding ribs in direct contact with the opposite ends of the rollers under a thrust axially thereof at all times, one of said ribs being provided by a reversely-bent sheet metal ring retained on one of the races and defining a lubricant-retaining chamber.

2,098,684
SLIP COVER
Walter L. Fry, Bloomfield Hills, Mich.
Application August 27, 1937, Serial No. 161,248
11 Claims. (Cl. 155—182)



5. The combination of an upholstered article of furniture having a seat, back and arms so related as to provide re-entrant angles at the junctions of these parts, and a self-conforming bag-like slip cover adapted to fit snugly a multiplicity of such articles varying in shape and size, said cover having a back compartment, arm compartments attached to the back compartment, and a seat portion secured to the inner portions of the back and arm compartments, said compartments and seat portion being continuous and comprising resiliently deformable fabric having a structure tending to adhere to the upholstery, said fabric tucked into said reentrant angles whereby said slip cover is maintained smoothly stretched over said article.

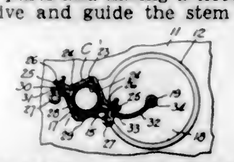
2,098,685
MEASURING APPARATUS
Thomas R. Harrison, Wyncote, Pa., assignor to The Brown Instrument Company, Philadelphia, Pa., a corporation of Pennsylvania
Application January 18, 1932, Serial No. 587,211
10 Claims. (Cl. 73—206)



1. Flow measuring apparatus comprising in

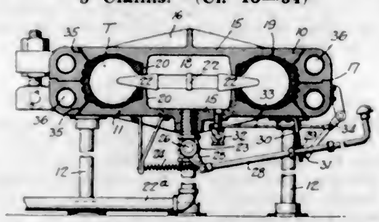
combination a member, means responsive to the velocity of flow of a fluid for adjusting said member into different positions in accordance with changes in said velocity, a second member, means responsive to a quality of said fluid for adjusting said second member into different positions in accordance with changes in said quality, a deflecting element adapted to oscillate about an axis,

and power actuated means for periodically adjusting said element angularly about said axis in a direction and to an extent depending upon the positions of said members at the time at which said adjustment is effected relative to the positions of said members at the time at which the immediately preceding periodical adjustment of said element was effected.



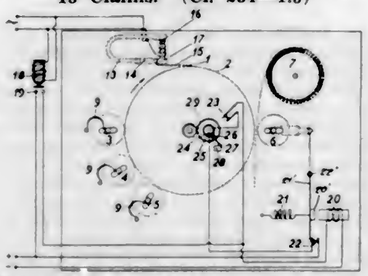
2,098,686
COMBINATION CLAMP AND GAUGE
Jenus F. Holm, Alhambra, Calif.
Application August 22, 1932, Serial No. 629,869
7 Claims. (Cl. 25—131)

1. A concrete form clamp comprising a pair of latch carrying elements; an intermediate tie element having detachable connection with said latch carrying elements; and pivoted and slidably mounted latching dogs upon the carrying elements; the tie element being co-operable with the latch carrying elements to definitely space the dogs apart from each other, whereby to enable the dogs to engage against the inner faces of the respective, oppositely disposed members of a mold whose mold space is of a width approximately equal to the distance of one dog to the other.



2,098,687
CENTERING GUIDE FOR FLUSH VALVES
George C. Kinsfather, Inglewood, Calif.
Application March 14, 1936, Serial No. 68,878
3 Claims. (Cl. 4—57)

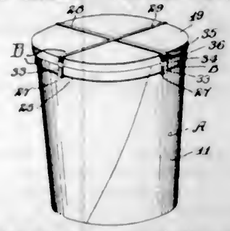
1. A centering guide for the flush valves of flush tanks having a seat for the valve and a vertical overflow tube disposed at one side of the seat, comprising a two part clamp, each part of which is provided with angularly related flat jaw portions; clamp screws passing through one of said parts and threaded into the other for operation when tightened with the clamp applied to the overflow tube, in causing the angularly related jaw portions of the respective clamp parts to co-act in rigidly supporting the clamp from the tube against tilting irrespective of variations in tube diameters; and an arm projecting from one of said clamp parts and having a sleeve adapted to freely receive and guide the stem of the flush



valve during raising and lowering movements of the valve; the arm being constructed of bendable material to enable adjustment of the length of the arm to be effected by laterally bending the arm in order to compensate for variations in the center to center distance between the overflow tube and seat and insure proper working and seating of the valve.

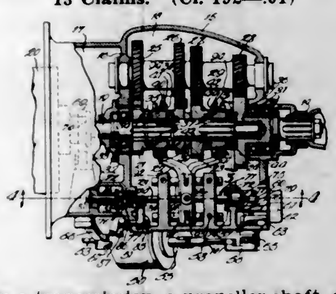
2,098,688
TIRE MOLD
Robert M. Lanyon, Los Angeles, Calif.
Application January 21, 1936, Serial No. 60,036
5 Claims. (Cl. 18—34)

1. A tire mold comprising means providing a curing chamber having a matrix adapted to receive the casing of a pneumatic tire; means for spreading and holding the beads of the tire spaced from each other; and means for causing expansion of the walls of the casing against the walls of the matrix directly from within the mold and including means for conducting a suitable volume of air at a predetermined pressure to the interior of the casing through the space between said beads.



2,098,689
APPARATUS FOR AUTOMATICALLY RECORDING UNUSUAL OR ACCIDENTAL OCCURRENCES
Emile Masson, St. Maurice, France
Application March 8, 1935, Serial No. 10,041
13 Claims. (Cl. 234—1.5)

1. Recording apparatus, comprising, in combination, means for recording physical quantities,

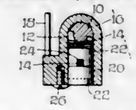


said means including a marker and a cooperating recording surface movable relatively to said marker and capable of transferring a record made thereon; means to operate said recording means to make a record of a physical quantity upon said recording surface; a second surface adjacent said recording surface; and means controlled by an abnormal variation in said physical quantity to move said second surface into contact with said recording surface to reproduce upon said second surface a record of said physical quantity, made upon said recording surface, comprising the variation in said record due to said abnormal variation in said physical quantity.

2,098,690
CONTAINER
Alfred R. Metzger, White Bear Lake, Minn.
Application February 15, 1934, Serial No. 711,438
8 Claims. (Cl. 229—47)

2. In combination, a container comprising tapered side walls, a bottom within said side walls, a container cover, a flat hoop about said side walls spaced from the large end of the container, diametrically opposed offset portions on said hoop and flat strap means connecting said diametrically opposite offset portions on said hoop to hold the container cover on the large end of the container.

2,098,691
TRANSMISSION
Paul W. Neff, Cincinnati, Ohio
Application January 19, 1934, Serial No. 707,346
13 Claims. (Cl. 192—.01)

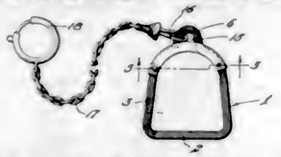


1. In a transmission, a propeller shaft, a clutch controlled drive shaft having its outer end axially engaged in the propeller shaft, a series of spaced gears loosely mounted on said drive shaft, a countershaft, a series of gears fixed on the countershaft, each thereof in constant mesh with a particular one of the first series, a slidable clutch means on the drive shaft for individually and selectively coupling the gears of the first series to the drive shaft, constantly meshing gears fixed on the countershaft and propeller shaft respectively, and an overrunning clutch between said propeller shaft and drive shaft for causing rotation of the drive shaft with the propeller shaft when the drive shaft tends to rotate or is being driven at a lower speed than the propeller shaft.

2,098,692
HIGH VOLTAGE SWITCHING DEVICE
Ralph R. Pittman and Carroll H. Walsh, Pine Bluff, Ark.
Application September 25, 1936, Serial No. 102,581
5 Claims. (Cl. 200—146)

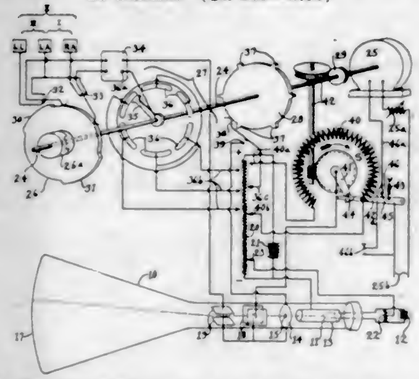
1. In combination, elements constituting a current carrying switch including a stationary insulator, a movable insulator, and separable contacts carried thereby, an arc suppressor swingably mounted on said stationary insulator, said arc suppressor including a cylindrical element of insulating material and a hollow tubular insulator arranged for telescopic movement with respect to said cylindrical element, separable arc suppressing contacts secured respectively to said element and said tubular insulator, latch means maintaining and resilient means opposing the engagement of said arc suppressing contacts, and means cooperating with said movable insulator for swinging said arc suppressor about its mounting for unlatching said tubular insulator and effecting the disengagement of said arc suppressing contacts.

2,098,693
LEVEL WIND MECHANISM FOR FISHING REELS
John V. Schafer, Bronson, Mich., assignor to Bronson Reel Company, Bronson, Mich., a corporation of Michigan
Application August 16, 1935, Serial No. 36,514
13 Claims. (Cl. 242—84.4)



1. A level wind drive mechanism for fishing reels comprising, in combination: a threaded shaft; a carriage slidable parallel to the shaft axis and bearing directly on the shaft, said carriage having a transverse bore adapted to house pawl means; pawl means including a plurality of separate pawls of different configuration, each pawl having a thread-engaging blade, one of said blades being shaped to fit the threads on a new shaft, and another of said blades being shaped to fit the threads on a worn shaft; each pawl having a cylindrical portion fitting said bore, and another portion shaped to engage another pawl; retaining means engaging the pawl farthest from the shaft to prevent movement of all the pawls radially away from the shaft axis; and line guiding means mounted on said carriage.

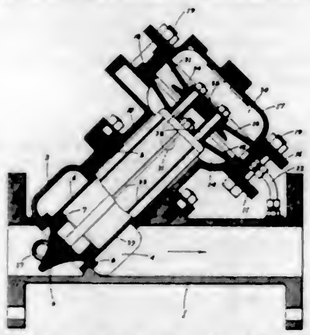
2,098,694
KEY HOLDER STRUCTURE
Carl Schraysshuen, Providence, R. I., assignor to Speidel Corporation, Providence, R. I., a corporation of Rhode Island
Application April 25, 1936, Serial No. 76,351
6 Claims. (Cl. 70—459)



1. A key holder of the character described comprising members having curvilinear portions, one end of one of said members being pivotally connected to the other member adjacent to an end thereof whereby the members are movable to

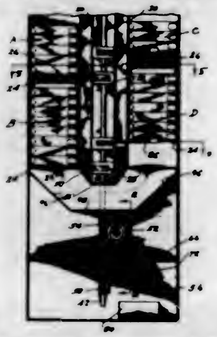
bring the free ends thereof into separated position or into connected overlapping relation with each other, the free end portions of said members being provided respectively with a bent offset portion and an opening so arranged that the off-

set portion of one member will enter the opening in the other member in the closed position of the members and provide a latch receiving recess therebetween, and a hook member passed through the recess to hold the member ends against separation.



2,098,695
ELECTROCARDIOGRAPH APPARATUS
Laurence F. Southwick, Meriden, Conn.
Application November 6, 1934, Serial No. 751,753
13 Claims. (Cl. 128—2.06)

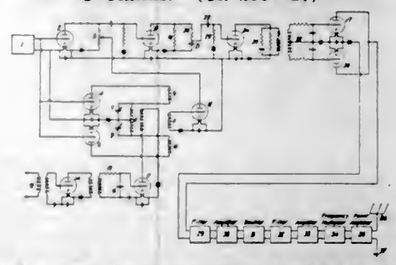
1. In an instrument for simultaneously exhibiting a plurality of graphs representing a plurality of variable electrical potentials, an audion tube amplifier, selector means adapted to successively impress upon said amplifier the voltage impulses derived from said potentials, circuits for superimposing characteristic biases on each of said impulses after amplification, distributor means for associating the individual potentials with their respective biases, a cathode-ray tube, and means for successively impressing said amplified and biased potentials upon the end wall of said cathode-ray tube.



2,098,696
WATER REDUCING VALVE
Arthur Joseph Sparrow, Oakland, Calif., assignor to Charles M. Bailey Company, Inc., San Francisco, Calif., a corporation of California
Application January 22, 1936, Serial No. 60,223
3 Claims. (Cl. 137—153)

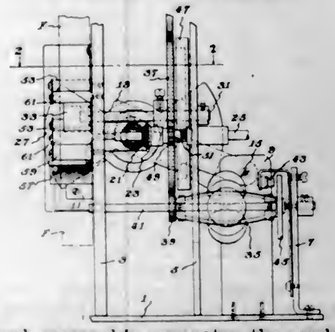
1. A reducing valve comprising a passage member adapted to form part of a liquid-flow line, means forming a closure in the member intermediate its ends to provide high and low pressure areas therein and comprising a valve seat fixed in the member and an axially movable valve engaging said seat, and having a stem projecting outwardly from said member, said valve opening in the direction of flow of the liquid, a casing structure into which the valve stem projects outwardly of the member, a pair of axially spaced diaphragms disposed at right angles to and beyond the valve stem, means securing the diaphragms to the stem, means securing the diaphragms about their periphery in the casing structure so as to form, with said structure, separate enclosed chambers on opposite sides of and between the diaphragms, passage means from the low pressure

area of the member to the chamber nearest the same, passage means from said area to the chamber between the diaphragms, a conduit from the high pressure area of the member to the remaining chamber, and means between said conduit and the low pressure area of the member to allow the high pressure liquid to bleed from said remaining chamber when the low pressure in the member drops a predetermined amount relative to the high pressure.



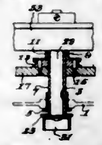
2,098,697
SINGLE COMPARTMENT SELECTIVE VENDING MACHINE
Anthony W. Vanderput, Los Angeles, Calif.
Application April 27, 1936, Serial No. 76,564
1 Claim. (Cl. 312—65)

A vending machine comprising a cabinet, a pair of adjacent upright merchandise compartments in said cabinet, each divided into a plurality of magazines, a compartment positioned centrally of said merchandise compartments, a plurality of selector arm units fixed within said central compartment, one for each of said magazines, a shaft in said central compartment and extending through and rotatable within said selector units, a rack on said shaft and having annular teeth formed concentrically thereon, a manually operable gear in constant mesh with said rack, whereby said shaft may be raised or lowered, a plurality of pins positioned in different spaced relation



than said selector arm units on said shaft, one for each selector arm unit, means in said selector arm units to receive said pins whereby one of said pins may be engaged with one of said selector units when said shaft is raised or lowered a predetermined distance and means to rotate said shaft and an arm in temporarily keyed relation to said shaft, whereby an article may be ejected from a preselected magazine.

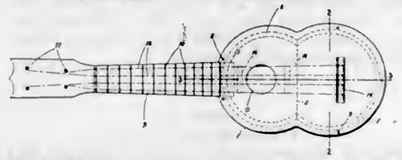
2,098,698
RADIO TRANSMITTING SYSTEM
Edwin H. Armstrong, New York, N. Y.
Application September 14, 1935, Serial No. 40,543
3 Claims. (Cl. 250—17)



1. A system for transmitting a wide band frequency-modulated wave substantially free from undesired frequency variations resulting from the reaction of the master oscillator current upon the output current of the succeeding multiplier stage, said system comprising a low frequency master oscillator, frequency varying means therefor and a series of frequency multipliers, of means for preventing the master oscillator from causing a variation in frequency of the transmitted wave corresponding to its own frequency, said means comprising a frequency selective system arranged to exclude the fundamental frequency from the second of said series of frequency multipliers.

2,098,699
COMBINED SOUND AND PICTURE APPARATUS
Cecil N. Batsel, Haddonfield, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application April 30, 1935, Serial No. 19,034
5 Claims. (Cl. 88—16.2)

3. In phonographic apparatus, the combination of a motor, a driving shaft associated with said motor, means for advancing a perforated film record uniformly past the sound translating station comprising a shaft and a sprocket mounted thereon for engaging said film, a gear on said sprocket shaft, a second gear resiliently coupled to said driving shaft and meshing with said first named gear, and a friction controlled governor coupled to said sprocket shaft gear for controlling the speed of said sprocket.

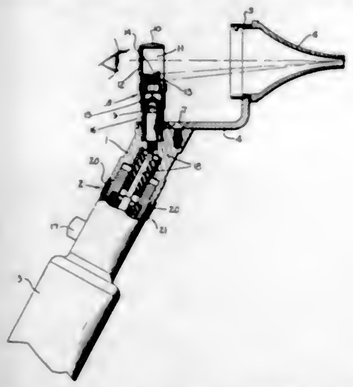


2,098,700
COMBINED SOUND AND PICTURE APPARATUS
Cecil N. Batsel, Haddon Heights, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application July 26, 1935, Serial No. 33,257
17 Claims. (Cl. 271—2.3)

1. In phonographic apparatus, the combination of a rotary film support at the sound translating station and means concentric with said film support and rotatable independently of said support for a feeding a film thereover, said feeding means and said support being arranged to coact with the film along adjacent portions thereof transversely of the film.

17. The invention set forth in claim 15 characterized in that the drum is narrower than the film strip and characterized further in that the sprocket has only one row of teeth, said sprocket being in engagement with one end of the drum whereby, when the film is threaded on the sprocket teeth, its opposite edge extends beyond the unengaged end of said drum.

2,098,701
UKELELE
Anthony G. Cox, Honolulu, Territory of Hawaii
Application February 13, 1937, Serial No. 125,580
2 Claims. (Cl. 84—291)



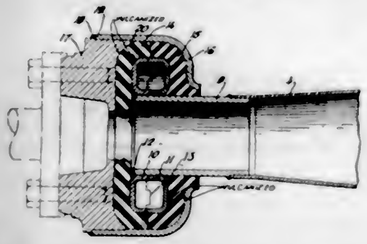
2. In a ukelele, a main open top body comprising a plurality of half cocoanut shells, a portion of each of which is cut away, the shells abutting and secured together along the lines of cut and forming a sound chamber, a top plate and means mounting the top plate on the shells and over the sound chamber.

2,098,702
DIAGNOSTIC INSTRUMENT
Louis L. Gagnon, Southbridge, Mass., assignor to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts
Application September 14, 1934, Serial No. 744,029
2 Claims. (Cl. 128—9)

1. In a device of the character described, a base having a handle connection adjacent one end thereof and a bracket adjacent its other end extending outwardly at an angle relative to the longitudinal axis of the base, said bracket having a speculum supporting portion adjacent one end thereof adapted to detachably receive a speculum and having a relatively slender upright casing ad-

jacent its opposite end and in spaced relation with the speculum support, said casing having a light chamber internally thereof and having a light passageway leading from said light chamber, a source of light in said chamber in alignment with the light passageway, a light deflecting member supported in alignment with the light passageway and with the light source adapted to receive the light rays coming through said passageway and deflect said light rays in the direction of the longitudinal axis of a speculum carried by the speculum support, a detachable cap member fitted over the light deflecting means

and having a sight opening extending transversely of the longitudinal axis of the casing with the axis of said sight opening substantially coaxial with the longitudinal axis of a speculum carried by the speculum support, said light deflecting means being positioned between the source of light and the sight opening and the said cap like member having an outside dimension substantially equal to the diameter of the casing, the size of said cap-like member and the spaced relation of the casing and speculum support permitting free and easy introduction and manipulation of operating instruments into the speculum of the instrument.



2,098,703

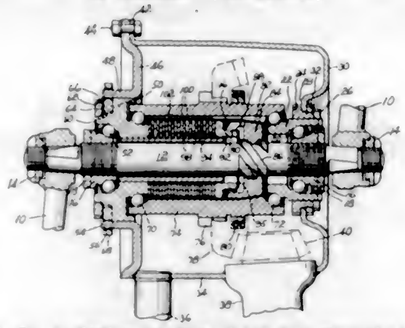
UNIVERSAL JOINT

Harvey D. Geyer, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application May 28, 1937, Serial No. 145,387

4 Claims. (Cl. 64—11)

4. In a resilient joint, two subassemblies each including a pair of spaced members, and a spacer of elastic deformable material joining said members, and means joining corresponding members of both pairs of members for action in unison.



2,098,704

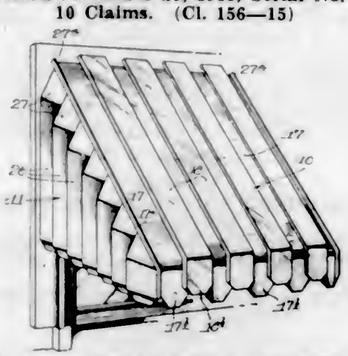
COASTER BRAKE AND MOUNTING

Edward W. Glacy, Bristol, Conn., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application October 20, 1936, Serial No. 106,619

13 Claims. (Cl. 192—6)

1. In a device of the character described, a hub, an axle extending through the hub, a brake anchor block on the axle, a coaster brake reacting between the anchor block and the hub, a frame member supported on the anchor block, and an anchor arm secured to the frame member and keyed to the anchor block outside of the frame member; substantially as described.



2,098,705

AWNING

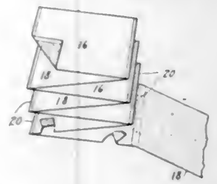
George A. Houseman, Shreveport, La.

Application November 25, 1935, Serial No. 51,433

10 Claims. (Cl. 156—15)

1. A sheet metal awning comprising side frames, roof cross bars connecting said frames, a plurality of narrow, laterally spaced roof plates extending transversely of said cross bars and being supported thereby in two sets in vertically spaced relation, the one set being adapted to rock relatively to the other set, the plates of the two sets being disposed so the plates of the one set cover the lateral spaces between the plates in the other set, and means for attaching the plates of the covering set to said roof bars, permitting said rocking movement.

2,098,706



MANIFOLDING FORM

Albert R. Lawson, Hamilton, Ontario, and Louis Huffman, Toronto, Ontario, Canada, assignors to Appleford Paper Products Limited, Hamilton, Ontario, Canada

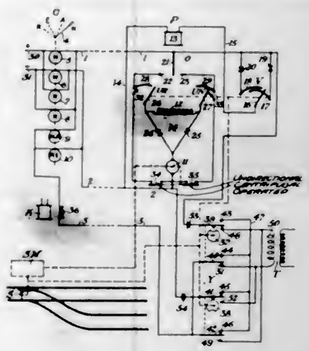
Application December 23, 1933, Serial No. 703,784

20 Claims. (Cl. 282—12)

1. In a manifolding form having a plurality of manifolding units, a continuous runner folded zigzag into a succession of folds and record leaves interleaved with the leaves of each fold to form each unit, and a carrier for the plurality of manifolding units comprising a back having flaps

folded inwardly from opposite sides over the leaves of one of the lowermost manifolding units and other flaps folded inwardly from other opposite sides above and below the uppermost manifolding unit.

2,098,707



ELECTRIC CONTROL AND INDICATION OF POINT OPERATING MECHANISMS FOR RAILWAYS AND THE LIKE

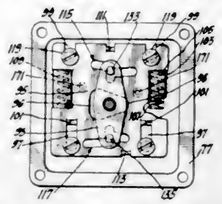
Roderick Marcus MacGregor and Douglas Goldie Shipp, London, England, assignors, by mesne assignments, to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application April 9, 1935, Serial No. 15,378

In Great Britain April 27, 1934

6 Claims. (Cl. 246—3)

1. In combination with a track switch, a normally deenergized polarized control relay at the track switch location and having a normally open contact which assumes a normal or a reverse position according as said control relay is energized in the normal or the reverse direction respectively, means effective when said contact occupies its normal or reverse position for selectively operating said track switch to its normal or reverse position respectively, means including a lever having a normal and a reverse position for selectively energizing said control relay in the normal or the reverse direction in accordance with the position occupied by said lever, and means automatically effective whenever said track switch and said lever are out of correspondence for energizing said control relay to thereby operate said track switch to a position in agreement with the position of said lever.



2,098,708

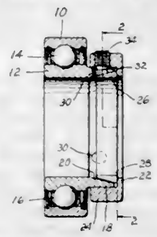
GEAR SHIFT MECHANISM

Dewey L. Maker and Harry E. Fidler, Detroit, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application January 27, 1936, Serial No. 60,919

5 Claims. (Cl. 74—473)

1. In a change speed transmission having gearing elements, a shift lever, a floating lever engaged thereby, shift forks having parts to operably engage the ends of the floating lever, said shift lever and floating lever having a neutral position wherein said forks hold said gearing elements in non-driving positions, mechanism having parts cooperating with said floating lever to impart a transverse movement thereto and also a rocking movement about one end thereof, in response to a movement of the floating lever by a fore and aft movement of the shift lever between its neutral and active positions.



2,098,709

ANTIFRICTION BEARING

William T. Murden and Rodger D. Brouwer, Bristol, Conn., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

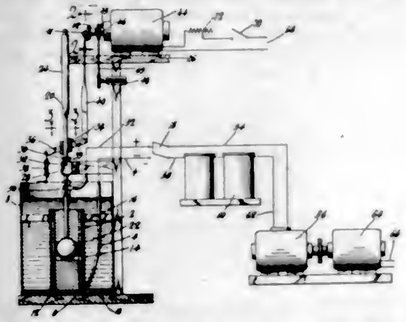
Application June 6, 1936, Serial No. 83,965

9 Claims. (Cl. 308—236)

1. In a device of the character described, a race ring having a raceway formed integrally therewith and a recess beyond the plane of the raceway, a wall of said recess tapering towards the adjacent end of the race ring, a wedging member having a tapering surface conforming to the wall of the recess, a reinforcing sleeve slidably fitting the race ring on a smooth surface opposite to the recess, and means for sliding the sleeve on said smooth surface of the race ring to shift the wedging member axially of the race ring; substantially as described.

2,098,710

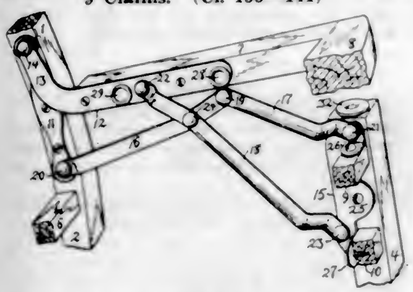
PROCESS OF MAKING COLLOIDAL LEAD



Dale M. Phillippi and James E. Wilson, Dayton, Ohio, assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

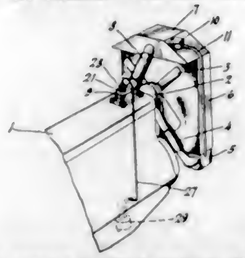
Application August 16, 1935, Serial No. 36,509

6 Claims. (Cl. 204—1)



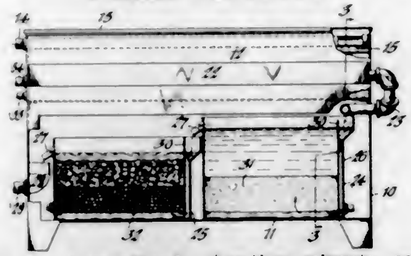
1. In a process for making a colloidal suspension of metal, casting the metal in a member to

only partially fill the same, immersing the whole in water, drawing an arc from one surface of



the metal intermittently and using reactance to smooth out the arc.

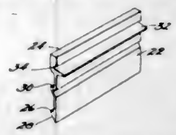
2,098,711
FOLDING CHAIR
William C. Rastetter, Fort Wayne, Ind.
Application May 25, 1937, Serial No. 144,670
9 Claims. (Cl. 155—141)



1. In a folding chair, a rigid rear frame structure constituting the back and rear legs of said chair, a seat, a foreleg structure, and mechanism operatively connecting said seat and foreleg structure with said rear frame, said mechanism consisting of right and left hand assembled groups of members, in each of which groups are included an anchor-plate secured to the rear frame, a hinge-plate secured to said seat and pivoted on said anchor-plate at the upper end thereof, a second anchor-plate secured to the front leg structure, toggle arms connected together by a pivot having a rounded projecting end, one of said toggle arms having pivotal connection with the lower end of the first-mentioned anchor-plate and the outer end of the other toggle arm having pivotal connection with said second anchor-plate at the upper end thereof, a lever pivotally connected to one of said toggle arms and at one end thereof with the corresponding hinge-plate and also connected pivotally at its opposite end with said second anchor-plate at the lower end thereof, each of said hinge plates having sockets formed thereon so located that the projecting ends of the corresponding toggle pivots have latching engagement in one or the other of said sockets accordingly when the seat and the foreleg structure are moved into extended or folded position, and cushions on the foreleg structure upon which the forward end of the seat bears when the chair is completely extended.

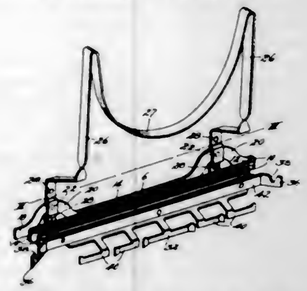
2,098,712
BY-PASS ARRANGEMENT
Harold A. Reynolds, Lockport, N. Y., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application January 10, 1936, Serial No. 58,470
12 Claims. (Cl. 123—178)

1. In an engine cooling system wherein an engine jacket has outlet and return connections with a radiator, a pair of independently acting valves controlling liquid flow through the outlet, heat responsive means affected by liquid temperature at the outlet to operate one of said valves, and means acting concurrently with the start of engine operation to close the other valve and hold it closed until engine operation stops.



2,098,713
APPARATUS FOR TREATING CLEANING SOLVENTS
Louis E. Wesselmann, Buffalo, N. Y.
Application May 10, 1935, Serial No. 20,809
3 Claims. (Cl. 196—15)

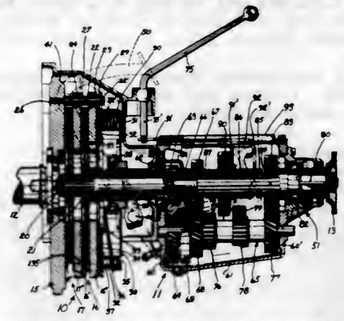
1. An apparatus for treating solvents, comprising a substantially rectangular tank having an acid pool therein adjacent its lower end and spaced from the bottom thereof, a substantially upright partition spaced from and coextensive with one of the side walls of the tank to provide a comparatively narrow inlet channel for the controlled flow of the solvent to be treated, the lower end of said partition terminating short of the tank bottom to provide a lateral opening for the controlled flow of the solvent into the tank beneath its acid pool and the upper end of said partition terminating in a laterally-offset, cascading-like wall, means for feeding the solvent onto said offset partition-wall, one of the other walls of the tank having an overflow discharge above the acid level thereof, and a receiver in communication with said discharge and into which the acid-treated solvent flows.



2,098,714
DIVIDING BAR
Samuel C. Awbrey, Kansas City, Mo.
Application January 7, 1935, Serial No. 603
6 Claims. (Cl. 94—17)

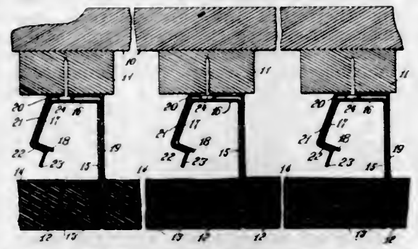
1. A dividing bar of the character described comprising a comparatively thin body of uniform width having a thicker portion along one longitudinal edge thereof serving as the top of the bar when in place; and an anchoring ledge formed along the side of said body with its outer

edge in substantially the same plane as the overlying outer edge of said thickened portion, said plane being parallel with the major plane of the body of the dividing bar.



2,098,715
TOGGERY RACK
Samuel C. Awbrey, Kansas City, Mo.
Application September 23, 1935, Serial No. 41,683
3 Claims. (Cl. 211—120)

1. A toggery rack comprising a strip of resilient material rebent upon itself a recurring number of times to present open-end slots, the bights and ends of said strip being in longitudinal offset relation; and a strip of material secured to one of the outermost lengths of said strip material in overlapped relation whereby a guide wall is presented at the entrance to each adjacent slot respectively.



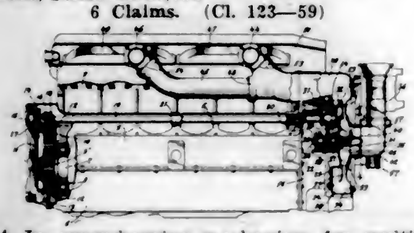
2,098,716
TRANSMISSION MECHANISM
Simeon Budlong, Chicago, Ill.
Application January 24, 1934, Serial No. 708,134
5 Claims. (Cl. 74—330)

1. A transmission of the character described comprising, in combination, driving and driven members, low and high speed clutches normally urged resiliently toward closed positions and adapted when moved from their open positions to be connected successively with said driving member, means for opening said clutches, torque responsive means operatively connected between said driving member and said low speed clutch and operable automatically during high torque conditions existing during closing movement of the low speed clutch to oppose and retard such closing movement of the low speed clutch, independently operable torque responsive control means connected between said driving member and said high speed clutch and operable automatically during high torque conditions to oppose and prevent closure of said high speed clutch during such high torque conditions, a pair of concentric shafts driven by said clutches, a counter-shaft, gearing from the shaft driven by said low speed clutch providing an over-running connection with said counter-shaft, gearing of a different ratio connecting the other shaft to said counter-shaft, means including manually shiftable gearing for selectively establishing a plu-

rality of different forward driving ratios between said counter-shaft and said driven member, and a manually operable shift lever for said shiftable gearing.

2,098,717
BUILDING CONSTRUCTION
Raymond M. Calkins, Deerfield, and James W. Swank, Chicago, Ill.
Application April 29, 1935, Serial No. 18,798
2 Claims. (Cl. 189—86)

2. In a building construction, the combination of a sheet metal panel having a straight flange portion extending backwardly from one edge of the body portion of the panel at right angles thereto and having a box structure formed on the inner face of the flange and comprising a second flange portion at right angles to said first named flange portion, and a third flange portion extending forwardly in divergent position with respect to said first named flange portion, and a second sheet metal panel having a fourth flange portion extending straight backwardly from its edge at right angles thereto and having a box structure formed on the outer face of the flange in position to be nailed to a supporting member, and comprising a fifth flange portion at right angles to said fourth flange portion, a sixth flange portion extending forwardly from said fifth flange portion in divergent position with respect to said fourth flange portion in such spaced relation thereto as to permit the first named box structure to enter the second box structure by a camming action from the front, and a seventh flange portion on the forward edge of said sixth flange portion extending forwardly in convergent position with respect to said fourth flange portion and adapted by snap engagement with said third flange portion to hold said two box structures releasably together for connecting said panels side by side and supporting them from said supporting member in forwardly spaced relation thereto.



2,098,718

SUPERCHARGER MECHANISM FOR INTERNAL COMBUSTION ENGINES

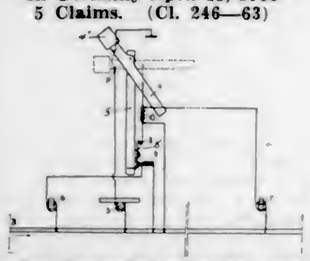
Harold Caminez and Norman H. Gilman, Indianapolis, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Original application March 17, 1933, Serial No. 661,327. Divided and this application May 20, 1936, Serial No. 80,734

6 Claims. (Cl. 123—59)

4. In supercharging mechanism for multiple cylinder internal combustion engines, a housing separate from the crank case of the engine and secured to the rear end thereof; a compressor rear wall secured in a seat provided in said housing, and having two bearings spaced apart from one another for supporting the shaft of a centrifugal compressor; a compressor front wall secured in a seat provided in said housing and having an inlet, said walls being shaped to provide an impeller chamber and a narrow passage leading therefrom into an enlarged annular chamber surrounding the outlet from said narrow passage; a discharge member associated with said housing and through which mixture flows from said annular chamber; a rotary impeller within said impeller chamber and the shaft of which is supported in the bearings aforesaid; and means for driving said impeller shaft from the front end of the engine.

2,098,719



RAILWAY SIGNALING SYSTEM AND APPARATUS

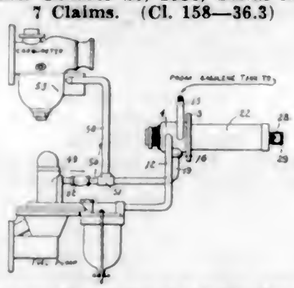
Siro Citterio and Palmino Vacchina, Turin, Italy

Application April 11, 1934, Serial No. 720,110

In Germany April 15, 1933

5 Claims. (Cl. 246—63)

1. Signaling device for railways, comprising an operating electromagnet carried by the train, a generator for continuously energizing said electromagnet, a signaling electromagnet carried by the train at a fixed distance from the operating electromagnet, said signaling electromagnet being magnetically separate from the operating electromagnet, an armature of magnetic material arranged on the track to complete a magnetic circuit between said operating and signaling electromagnets, respectively, when said electromagnets pass over said armature and thus generate in the winding of the signaling electromagnet a current having a given characteristic to positively produce a given signal, a winding on said track armature and means responsive to the track conditions to short-circuit said winding, to generate in said winding a current producing a flux which modifies the characteristics of the current of the signaling electromagnet to give a second positive signal.



2,098,720

FUEL LINE CLEARING AND VAPOR LOCK REMOVING DEVICE

Frederick C. Dalton, Portland, Oreg.

Application October 20, 1936, Serial No. 106,703

7 Claims. (Cl. 158—36.3)

4. In apparatus of the character described, the combination with a mechanically actuated fuel pump, a carburetor, a pipe leading from said pump to said carburetor, a fuel supply line connected to said pump, of a device comprising a valve case having two separate ports connecting the fuel supply line and a third port, a pipe connecting said third port to said pipe between said fuel pump and said carburetor, a valve in said case, a cylinder secured to said valve to turn therewith, a piston and piston rod within said cylinder, means to reciprocate said piston and its rod and to turn said cylinder, said valve having a master bore communicating with said cylinder, and having a duct with ports serving normally to effect communication between the sections of the fuel supply line to leave an uninterrupted flow of fuel through said fuel supply line to said carburetor via said mechanically actuated fuel pump, said valve having another port to effect communication between said master bore and said third port and a further port with check valve to communicate with the casing port to which fuel is delivered by said fuel supply line, in virtue of all of which when said valve is in a position to cut off direct communication between the fuel supply and the carburetor, and when said another and further ports are in operating position, fuel may be manually pumped to the carburetor.

2,098,721

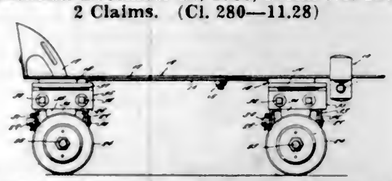
RESILIENT FASTENER

Daniel Douglas Demarest, Little Neck, N. Y.

Application November 30, 1936, Serial No. 113,482

10 Claims. (Cl. 85—1)

6. A fastener of the type described, comprising a relatively thin nut member, and a screw member from which material is removed on opposite sides, so shaped and arranged that, when engaged, there is one position where said nut member may pivot a limited amount on the remaining portions of the screw threads, to permit easier rotation in that position.



2,098,722

INTERCHANGEABLE DUPLEX ROLLER UNIT

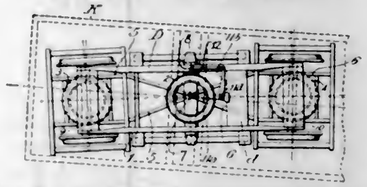
Ludwig Depovsek, Maspeth, N. Y.

Application December 22, 1936, Serial No. 117,201

2 Claims. (Cl. 280—11.28)

2. In combination with a base part having slots therein, a channel-shaped member having projections at the upper edges of its flanges for fitting in the slots and adapted to be bent over to attach the channel member to the base part, a T-shaped member attached to the under face of the channel member, a wheel carrying body and clamping means connected with the body and engaging the T-shaped member.

2,098,723



RAIL-GUIDED VEHICLE

Max Frei, Neuhausen, Switzerland, assignor to firm Schweizerische Industrie-Gesellschaft, Neuhausen, Switzerland

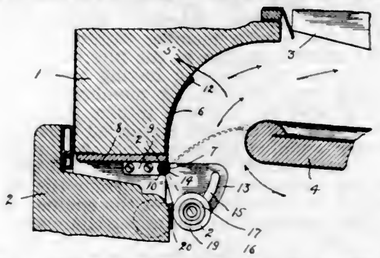
Application September 17, 1935, Serial No. 40,983

In Switzerland September 26, 1934

10 Claims. (Cl. 105—168)

1. A rail-guided vehicle, comprising in combination, a vehicle body structure, a bogie having a frame on which said body is pivotally supported, a pair of axles extending transversely of the longitudinal direction of the bogie frame, an axle frame for each of said axles mounted in said bogie frame and turnable about vertical axes, said bogie frame being supported by said axle frames at said vertical axes, articulated means for connecting said two axle frames to each other, said means being situated in the middle portion of the bogie frame, and means operatively connected to one of said axle frames for causing a displacement of said connecting means by relative longitudinal movement between the vehicle body and bogie on negotiating curves, whereby the axles are angularly adjusted, said connecting means allowing relative lateral movements between said body and bogie without affecting the angular positions of said axles.

2,098,724



REFRIGERATOR

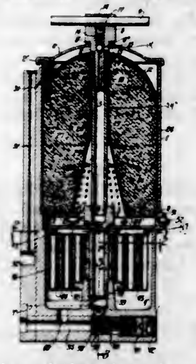
Martin Hokanson, Duluth, Minn., assignor to Eldco Inc., Duluth, Minn., a corporation of Minnesota

Application August 6, 1936, Serial No. 94,597

9 Claims. (Cl. 62—47)

1. In a refrigerator having a door, an ice rack, a drip pan, and an air circulating space intermediate of said ice rack and drip pan; a damper for regulating the flow of air through said space mounted adjacent said door, means fixed to said damper and depending in the path of said door,

whereby upon opening of the door the damper will close said space, and vice versa, said means being adjustable to vary the limit of movement of the damper.

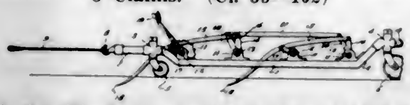


2,098,725

OIL FILTER

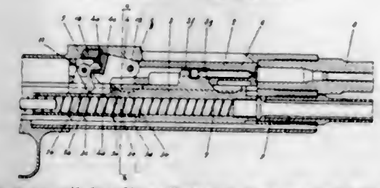
James E. Hurn, Saugerties, N. Y., assignor to The De Luxe Products Corporation, La Porte, Ind.

Application April 27, 1935, Serial No. 18,546



4 Claims. (Cl. 210—131)

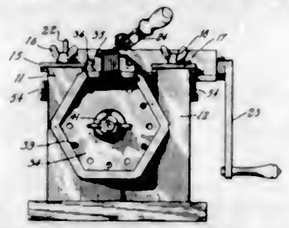
1. In a device of the class described the combination with an internal combustion engine of an oil purifying device consisting of a housing having inlet and outlet means adapted to register with inlet and outlet channels communicating with the crankcase of such an engine; there being in said housing two chambers, one above the other, having a dividing wall between the said chambers; a tubular member vertically axial of the housing and the two chambers, there being a constricted aperture in the said tubular chamber approximately along the line of the dividing wall; in the lower chamber a series of concentrically arranged screens dependingly attached to a bracket providing free oil space between the bracket and the lower side of the dividing wall; open channels from the screen members into the said open space; apertures from the open space into the central tubular member below the dividing wall; the inlet to the housing from the engine being into the lower chamber there being an outlet direct into the said screen chamber, and a valve controlled connection with the tubular member; a sump in the screen chamber; an outlet from the tubular member to the crankcase of the engine; an outlet from the sump in the screen chamber; the upper chamber containing a sump, and assembled above



the said sump a filtering cartridge consisting of a base having a conical member extending upward from the said base and an amorphoused mass of filtering material confined within a foraminous sack, the said cartridge suspended around the tubular member; apertures in the wall of the tubular member within the confines of the conical portion of the filtering cartridge; a cover for the housing having locking means coacting with the tubular member to lock the housing and its contents into a unit; a valve with tensioning element assembled in the locking member adapted to determine the pressure in the portion of the tubular member in the upper filtering chamber; an outlet from the filtering chamber to the crankcase of the engine; an outlet from the sump in the upper chamber.

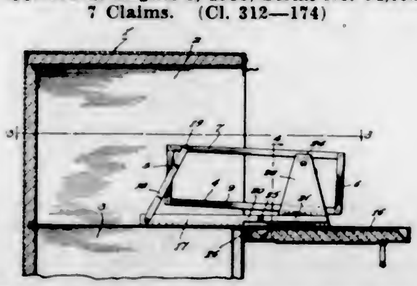
2,098,726
CULTIVATOR
Elton R. Kenyon, Geneseo, Kans.
Application May 13, 1937, Serial No. 142,486
5 Claims. (Cl. 55—102)

1. A cultivator comprising a pair of side bars, supporting wheels for said side bars, a pair of transverse shafts rockably mounted on the side bars, arms fixed to one of said shafts, teeth pivotally connected, at one end, to said arms and extending forwardly and downwardly therefrom, and arms fixed on the other shaft and pivotally connected to the teeth at an intermediate point.



2,098,727
LOCK MECHANISM FOR AUTOMATIC GUNS
Aimo Johannes Lahti, Jyvaskyla, Finland
Application July 6, 1936, Serial No. 89,209
In Germany September 23, 1935
1 Claim. (Cl. 42—3)

In a recoil loading firearm the combination of a reciprocating breech block, a pivoted locking member on said block having an abutment seating in a recess of the breech to lock said breech block thereto, a double armed lever pivoted to said breech block having one arm cooperating with said locking member to release said member from said recess in said breech, an actuator cooperating with the other arm of said lever to actuate the same and said actuator having a cam surface cooperating with said locking member to replace said member in said recess after having been removed therefrom by said lever.



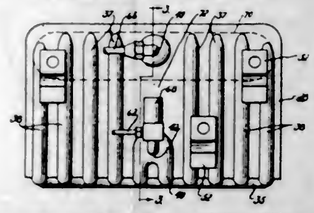
2,098,728
KEY CUTTING MACHINE
Seth A. McPhee, Denver, Colo.
Application January 27, 1936, Serial No. 61,005
5 Claims. (Cl. 90—13.5)

1. A key cutting device comprising a base plate; a standard extending upwardly from said base plate; a pair of key clamps fixedly supported by said standard above said base plate; a hinged frame hinged to said base plate; a slide bearing mounted in said bearing frame so that it may be moved therein parallel to said key clamps; a shaft journalled to said slide bearing; means for preventing endwise movement of said shaft in said slide bearing so that movements of the latter will be transmitted to the former; a cutter carried by said shaft; means for rotating said

shaft; a follower member projecting from said slide bearing, said follower being spaced from said cutter a distance corresponding to the distance between said key clamps; a handle pivoted to said hinged frame and connected to said slide bearing so that vertical movement thereof will swing said hinged frame toward or away from said key clamps and horizontal movement thereof will move said cutter and follower along said key clamps.

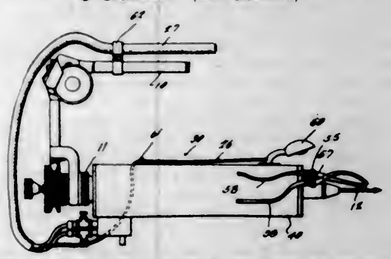
2,098,729
OVEN
Oren T. Myers, De Soto, and Anthony Emily, Richwoods, Mo.
Application August 3, 1936, Serial No. 94,092
7 Claims. (Cl. 312—174)

1. In a device of the character described, a structure defining a chamber open at its front, a door for closing the open front of the chamber hinged at its lower end, runners in said chamber shiftable longitudinally thereof, a frame, links pivoted to said runners and to said frame, and arms carried by said door and pivotally connected with the frame and said runners for shifting the runners longitudinally and moving said frame to an extended position out of the open front of the chamber when the door is swung downwardly to an open position.



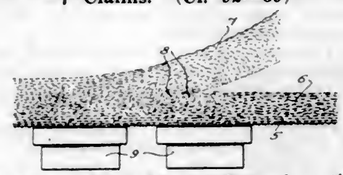
2,098,730
REGISTER SET-BACK CRANK
Walter H. Parker, Pittsburgh, Nelson J. Seibert, Wilkinsburg, and George J. Genung, Pittsburgh, Pa., assignors to Pittsburgh Equitable Meter Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application February 3, 1934, Serial No. 709,640
1 Claim. (Cl. 74—548)

In a shaft operating mechanism, a manually operated crank arranged to operate said shaft only when selectively manipulated in a predetermined manner by an operator comprising a ratchet on the end of said shaft, a crank on the end of said shaft with a rotatable handle at the



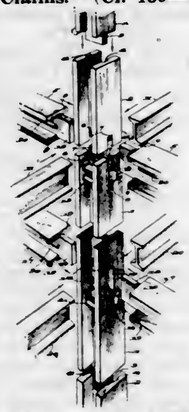
end thereof, a pawl fixed to said handle to rotate therewith and to engage said ratchet when said handle is rotated, and means normally urging said pawl out of engagement with said ratchet.

2,098,731
REFRIGERATING APPARATUS
Lawrence A. Philipp, Detroit, Mich., assignor, by mesne assignments, to Nash-Kelvinator Corporation, Detroit, Mich., a corporation of Maryland
Application November 28, 1934, Serial No. 755,082
14 Claims. (Cl. 62—126)



1. An evaporator for refrigerating systems comprising material formed to provide upper and lower headers and passages for the flow of refrigerant, so constructed and arranged as to direct the flow of refrigerant from a refrigerant inlet intermediate said headers first to said lower header at a plurality of locations in said lower header before entering said upper header and later returning said refrigerant from said upper header to said lower header for recirculation.

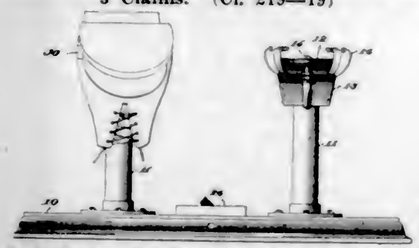
2,098,732
DENTAL APPARATUS
Thomas F. Prather, Wasco, Calif.
Application April 19, 1937, Serial No. 137,878
5 Claims. (Cl. 32—28)



5. In combination, a dental drilling instrument, a water jacket disposed around the instrument, a heating unit disposed around the instrument, and a nozzle extending from the water jacket toward the chuck of the instrument, and a jacket-like structure for receiving the heating element and defining a handle for the instrument, said last-mentioned jacket having an air inlet and an air outlet, and a nozzle connected to the air outlet of the last mentioned jacket.

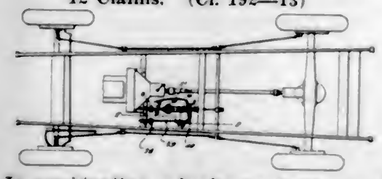
2,098,733
PLYBOARD
John W. Sale, Hopewell, Va., assignor to Hummel-Ross Fibre Corporation, Hopewell, Va., a corporation of Virginia
Application September 20, 1937, Serial No. 164,808
7 Claims. (Cl. 92—39)

1. A facing sheet of paper formed on the continuous wire of a Fourdrinier type machine comprising two co-extensive strata of cellulosic fibers having varying amounts of stock hydration, the two strata having the fibers of each unmixed at the surfaces of the sheet but intermingled and interlocked within the body of the sheet so that the sheet is devoid of lines of jointure and does not peel or separate under flexure, one of said strata constituting the wire side being formed of long fibered, slack-sized stock having a greater freeness and being relatively less hydrated with respect to the other strata and producing a porous absorbent outer surface on one face of the sheet constituting a pasting side of the facing, while the other of said strata is formed of relatively short, fine fibered and highly refined hard-sized, slow stock having a greater amount of hydration and providing a hard, smooth outer surface on the other face of the facing sheet constituting a liner side, the sheet having the characteristics resulting from the simultaneous dewatering of both strata on a single continuous Fourdrinier wire.



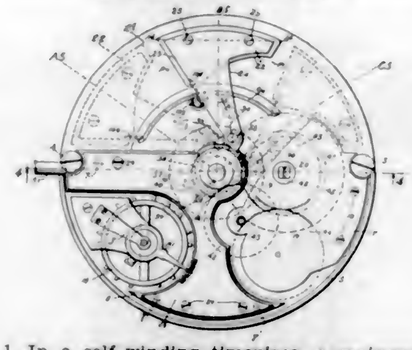
2,098,734
METALLIC FRAME FOR BUILDING CONSTRUCTION
Wesley Wait, Newburgh, N. Y.
Application April 28, 1936, Serial No. 76,848
5 Claims. (Cl. 189—36)

3. In a metallic frame for buildings, the combination of a column including upper and lower sections of the H-shape type with the flanged sides of the two sections in abutting relation, each of said sections having the end part of its web cut away to form a recess between the end parts of the flanged sides, said flanged sides having slots in their end parts coinciding



with said recess, the abutting relation of the two column sections being such that their respective recesses register with each other to provide a common recess in the web of the column and so that their respective slots register with each other to provide a common slot in the respective sides of the column, opposite girders having at their inner ends tongues respectively seated in the opposite common slots and abutting at their ends in the common recess in the web of the column, said tongues being shaped to pass through the respective common slots in the flanged sides of the column to seat within the common recess in the web of the column, and means for securing the tongues in the common recess in their abutting relation.

2,098,735
SHOE HEATING
Louis Yentis, New York, N. Y., assignor to Norman K. Winston, New York, N. Y.
Application July 30, 1934, Serial No. 737,647
3 Claims. (Cl. 219—19)

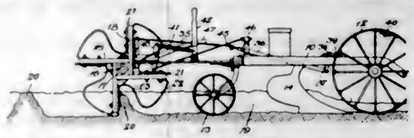


1. A device for heating shoes comprising a standard, a heating element carried at the top of the standard and somewhat the shape of a shoe sole, and a plurality of curved spring members for supporting a shoe inverted over the heating element with the shoe sole substantially parallel with the heating element but out of contact therewith, the sole of the shoe being somewhat larger than the heating element.

2,098,736
AUTOMATIC BRAKE CONTROL
Joseph F. Bannon and Clarence W. Bigler, Crafton, Pa.
Application October 16, 1934, Serial No. 748,524
12 Claims. (Cl. 192—13)

1. In combination, a brake mechanism including a control member having a brake connection, a clutch pedal, a fluid reservoir, a cylinder including a piston therein connected to said control member, said cylinder communicating with said reservoir, and valve means for shutting off communication between said reservoir and the cylinder when the clutch pedal is operated to clutch disengaged position, said cylinder and reservoir being of unitary construction, said valve means consisting of the provision of a bore in one end of the cylinder, a tubular valvular slide provided with a valve head at one end engageable against the cylinder at one end of the said bore, said valvular member being open across its entire length and provided with ribs extending longitudinally on its outer side terminating inwardly of the said head, to define fluid passageways between the said valvular member and the wall of the bore, said valve head being provided with a seat therein, a spring-projected-to-closed-position valve in the said valve head, said spring-projected valve being provided with a stem extending through the valvular member, and a cam engaged with the free end of the stem and being operatively connected with the said clutch pedal.

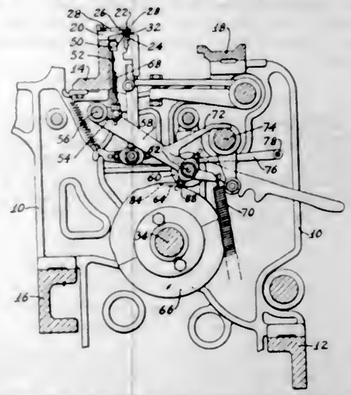
2,098,737
SELF-WINDING TIMEPIECE
Louis Bornfriend, Brooklyn, N. Y.
Application July 8, 1931, Serial No. 549,438
6 Claims. (Cl. 58—82)



1. In a self-winding timepiece, a mainspring connected with a winding-train comprising a threaded staff, a gear secured thereto, a second gear rotatively mounted on said staff, a nut mounted on said threaded staff to provide a frictional connection between the two gears, and a self-winding means operating said winding-train.

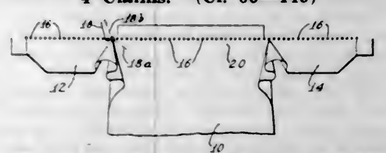
3. In a self-winding timepiece, a winding-train, comprising a threaded barrel-arbor, a gear rotatively mounted on said arbor, a stopping click engaging said gear, a spring plate secured to the gear, a nut non-rotatively mounted on said threaded barrel-arbor and coacting with said spring-plate to disengage the stopping click at a predetermined time and a self-winding means to operate the winding-train.

6. In a self-winding timepiece, a barrel, a barrel-arbor, a mainspring connecting said barrel and barrel-arbor, a baseplate supporting said barrel-arbor, a winding train operating said barrel arbor, an oscillating pendulum, having a projecting weight, operatively connected with said winding-train, a hand-setting mechanism, including a stem, mounted on said baseplate, said stem being mounted on the horizontal line of the baseplate, said stem and barrel-arbor being mounted in opposite vertical halves of the baseplate, a recess in said baseplate to provide swinging space for the weight of the pendulum, and a gearing-train, comprising a third wheel and fourth wheel, mounted on the baseplate, said fourth wheel being mounted on the central vertical line of the baseplate, the third wheel and the barrel-arbor being mounted in two opposite vertical halves of the baseplate.



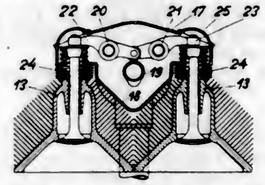
2,098,738
ATTACHMENT FOR LISTER PLANTERS
George Campbell, Aurora, Nebr.
Application May 19, 1937, Serial No. 143,429
6 Claims. (Cl. 97—55)

1. A device of the character described, including a shaft, a circular series of arms fixed to the shaft and located at an angle to each other, scraper blades fixed to the arms, and carry-over irons fixedly located between the blades, said



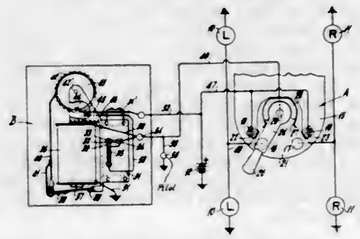
irons having concave portions to straddle the dams built up by the blades and having convex portions to engage the ground.

2,098,739
MANUFACTURE OF FULL-FASHIONED HOSIERY ON FLAT KNITTING MACHINES
John S. Chipman, Easton, Pa., assignor to Chipman Knitting Mills, a corporation of Pennsylvania
Application January 21, 1937, Serial No. 121,490
4 Claims. (Cl. 66—109)



1. In a flat knitting machine having needles movable as a unit with relation to a press edge, independently movable yarn measuring sinkers to which the yarn is fed and dividers, the combination of knockover elements cooperating therewith, and a knockover bit motion including a cam operable to raise the knockover bits from a low position to a point closely adjacent the under side of the sinkers subsequent to the advance of the sinkers to sink yarn and prior to the advance of the dividers to reform the yarn kinks against the shanks of all the needles.

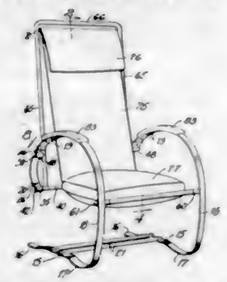
2,098,740
KNITTING OF INSIDE-OUT HOSIERY
John S. Chipman, Easton, Pa., assignor to Chipman Knitting Mills, a corporation of Pennsylvania
Application January 21, 1937, Serial No. 121,491
4 Claims. (Cl. 66—148)



1. The method of manufacture of inside-out hosiery which comprises the steps of transferring to the points of a transfer bar the last course of instep fabric and adjacent inner selvage heel wale loops of the leg and heel portions of a hosiery blank having a yarn end appearing at the heel corner between the instep and heel fabrics, and laying the yarn rearwardly between the points to cause said yarn end to appear on the under side of the fabric during the subsequent knitting of the foot.

2,098,741
AIR-COOLED CYLINDER HEAD
Manfred Christian, Berlin-Reinickendorf, Germany
Application September 24, 1935, Serial No. 41,855
In Germany July 16, 1934
3 Claims. (Cl. 123—171)

1. In an air-cooled engine, a series of adjacent cylinders, each cylinder having a cylinder head of roof-like shape whose walls converge upwardly toward a ridge transverse to the cylinder series, valve chambers arranged along said ridge, and cooling ribs projecting perpendicularly from said converging walls and arranged in superposed parallel planes having their longitudinal axes parallel to said ridge.

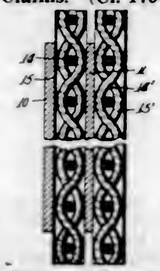


2,098,742
SIGNAL DEVICE
William R. Curtiss, Meriden, Conn., assignor to Connecticut Telephone and Electric Corporation, Meriden, Conn., a corporation of Delaware
Application May 12, 1933, Serial No. 670,696
3 Claims. (Cl. 177—337)

1. In a directional signalling apparatus for automotive vehicles, a left-turn signal, a right-turn signal, a source of electric energy, a separate circuit for electrically connecting each of said signals and said source, switch means having a common movable element for temporarily closing the circuit to either of said signals to selectively energize the latter, other circuits including said element for selectively connecting said source and said signals, common means in said other circuits for fluctuating the current flow therein to cause said signals to flash intermittently, common switch means in said other circuits, means for closing and maintaining said last-named switch means closed during a predetermined number of flashes of said signal comprising an electro-magnet and a ratchet mechanism operable by said electro-magnet, means

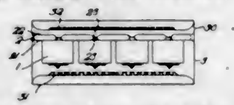
controlled by said ratchet mechanism on its initial movement for closing said last named switch means and maintaining said last named switch means closed during a cycle of operation of said ratchet mechanism, a circuit including said source and said electro-magnet and temporarily closed through said switch element when either of said first-named circuits to said signals are temporarily closed, and a circuit connecting said electro-magnet and said source including said current fluctuating means whereby said electro-magnet is rendered effective to intermittently actuate said ratchet mechanism.

2,098,743
CHAIR
Philip E. G. Ericson, St. Charles, Ill., assignor to The Howell Company, St. Charles, Ill., a corporation of Illinois
Application November 26, 1935, Serial No. 51,646
6 Claims. (Cl. 155—50)



1. In a chair, the combination of a base frame comprising a floor contacting member and a resilient supporting member consisting of spaced side portions extending upwardly from the forward edge of the floor contacting member and then rearwardly to overlie the floor contacting member with their rear ends standing in freely suspended relation thereto over the rear end of the floor contacting member, a back frame located between the spaced side portions of the supporting member and having on each side two vertically separated points of direct connection with the freely suspended ends of the side portions of the supporting member, the rear end of each of said side portions terminating at the lowermost connection with said back frame and providing between said vertically separated points of direct connection a resilient support for the back frame, and a seat and back carried by the back frame and the side portions of the supporting member.

2,098,744
INHIBITIVE COMPOUND
Augustus H. Fiske, Warren, R. I., assignor to Rumford Chemical Works, Rumford, R. I., a corporation of Rhode Island
No Drawing. Application April 9, 1937, Serial No. 135,932
10 Claims. (Cl. 148—8)



1. A cleaner-assistant for compensating premature lag in partially spent alkaline baths for articles of precious or like metals preparatory to being electroplated, consisting of a dry, intimate soluble mixture of an alkali metal cyanide salt, a non-electrolytic colophony inhibitive of corrosive action on the cleaned metal surfaces, and a powdered borate preventative of colophony attachment thereto.

2,098,745
ELECTROLYTIC CONDENSER
Alexander Georgiev, Brooklyn, N. Y., assignor to Aerovox Corporation, a corporation of New York
Application September 2, 1932, Serial No. 631,479
12 Claims. (Cl. 175—315)

1. An electrolytic condenser comprising electrodes and a composite fibrous interlay interposed therebetween, said interlay including two superposed elements, one of relatively open mesh and high electrolyte-absorptive capacity and the other of close texture and lower electrolyte-absorptive capacity.

2,098,746
ARRANGEMENT IN CONDENSERS
Bror Hansson, Stockholm, Sweden, assignor to Allmänna Svenska Elektriska Aktiebolaget, Vasteras, Sweden, a Swedish corporation
Application March 20, 1936, Serial No. 69,779
In Sweden September 2, 1935
5 Claims. (Cl. 175—41)

1. In a condenser of the character described, a tank, a medium under pressure in the tank, a cooling wall subjected to the pressure of said medium, condenser elements enclosed in the tank and having their foils pressed against the said wall, a second wall serving as a support for the cooling wall, and means for applying to the second wall fluid pressure equal to the pressure of the said medium in the tank to maintain the said cooling wall in plane form.

2,098,747
SOCKET
Warren K. Henning, Plano, Ill.
Application November 16, 1936, Serial No. 111,072
6 Claims. (Cl. 173—328)

1. A tube socket comprising an insulating base having a contact-receiving opening therethrough and a contact and wiring terminal member formed of a single piece of sheet material shaped to provide a substantially cylindrical portion open along one side only for embracing and engaging a tube pin terminal and a flat wiring terminal portion extending from said cylindrical portion, said flat portion lying substantially in an axial plane through the cylindrical portion, said contact-receiving opening comprising a substantially cylindrical portion for receiving the cylindrical portion of said member, and a slot portion for receiving the flat portion of said member, said opening having a shoulder adjacent the junction of the slot portion with the cylindrical portion engaged by the contact portion of said member for limiting the distance of insertion of said member.

2,098,748
ARTICLE OF MANUFACTURE
Alfred Joseph Jennings, Bridgeport, Conn., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application June 26, 1936, Serial No. 87,587
9 Claims. (Cl. 41—39)

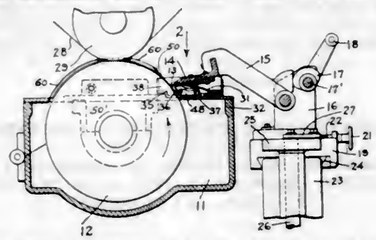
1. A coated vulcanized rubber sand-blasting stencil sheet comprising rubber and wood flour associated in the arrangement obtainable by sheeting a composition consisting of:

	Parts
Crepe rubber	25
Wood flour	20
Montan wax	8
Clay	25
Whiting	15
Mercapto-benzo-thiazole-zinc salt	1
Zinc oxide	4
Stearic acid	.5
Sulfur	1
Phenyl-beta-naphthylamine	.1

and vulcanizing the sheeted material, the coating containing rubber in the arrangement obtainable by coating the vulcanized sheet with a composition consisting of:

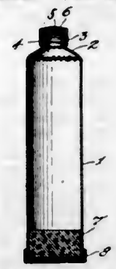
	Parts
Soft crepe rubber	100
Brown factice	20
Rosin	10
Burgundy pitch	5
Pine tar	5
Mineral oil	5
Zinc oxide	10

9. A vulcanized rubber sand-blasting stencil sheet containing 20% to 40% rubber and 10% to 40% fibrous filler.



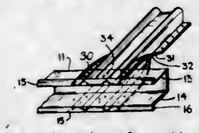
2,098,749
GAUGE FOR MEASURING THE ALIGNMENT OF VEHICLE WHEELS
William James Johnston, London, Ontario, Canada, assignor to Albert Speare Lashbrook, London, Ontario, Canada
Application October 29, 1936, Serial No. 108,129
13 Claims. (Cl. 33—203)

1. A gauge for measuring the alignment of the wheels of a vehicle, comprising spaced apart markers each adapted to inscribe a line on the periphery of one of the wheels; a scale mounted on the reverse side of one of the markers; and means for reversing the position of the marker to present the scale to the inscribed line.



2,098,750
INKING MECHANISM FOR ROTARY INTAGLIO PRINTING MACHINES
Richard A. Krahmer, Yonkers, N. Y., assignor to R. Hoe & Co., Inc., New York, N. Y., a corporation of New York
Application April 4, 1936, Serial No. 72,733
13 Claims. (Cl. 101—169)

1. In a rotary intaglio printing machine, a flexible doctor blade adapted to reciprocate longitudinally along and in contact with the peripheral surface of a printing cylinder, a blade wiper mounted for free movements toward the



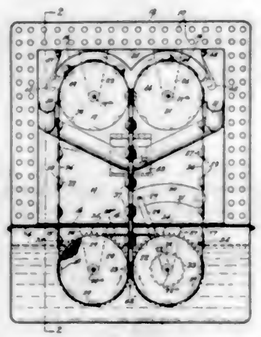
blade and transversely to the direction of movement of the blade to engage the surface of said blade, and means to resiliently press said wiper against said blade.

2,098,751
CONTAINER
Herman B. Lermer, Newark, N. J., assignor, by mesne assignments, to Joseph Lermer, Herman B. Lermer, and Irving S. Lermer, copartners doing business as Hygienic Tube & Container Company
Application October 13, 1936, Serial No. 105,356
2 Claims. (Cl. 221—60)

1. A container for dispensing powders, creams and the like, comprising a tube made from a transparent, flexible, non-breakable collapsible material, said tube being open at one end and having the other end thereof reduced to provide an externally threaded tip having an orifice therein, and a plug closing the bottom of the tube, said plug having attached thereto a base enabling the tube to be supported in an upright position, said base having a diameter greater than the diameter of the plug and provided with upstanding flanges adapted to engage the lower edge of the tube.

2,098,752
STRUCTURAL SECTION FOR AIRCRAFT
Roy G. Miller, Langhorne, Pa., assignor to Fleetwings, Inc., Bristol, Pa., a corporation of Delaware
Application February 6, 1935, Serial No. 5,191
23 Claims. (Cl. 189—36)

1. A strut of a structural section comprising a closed non-cylindrical tubular element having a substantially semi-cylindrical reinforcing bead



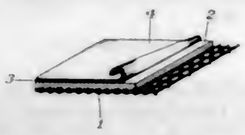
extending the full length of the strut, the end of the strut comprising two spaced walls having flat areas arranged to receive a cap strip between them said flat areas extending substantially diametrically of said bead, one of said walls having the bead extending to its end adjacent a flat area.

2,098,753

APPARATUS FOR PRODUCING INDIVIDUAL MASSES OF ICE

Balthazar H. T. Mulch, Westwood, N. J.

Application December 19, 1935, Serial No. 55,146
16 Claims. (Cl. 62—108.5)



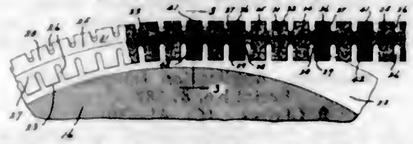
1. The combination with a refrigerator, of mechanism for carrying individual masses of water, into the freezing zone of the refrigerator, comprising two endless conveyors adapted to travel in opposite directions with two of their runs in proximity, driving mechanism for said conveyors, cups of resilient material arranged in horizontal alignment on the two conveyors, a water tank within which the lower portions of said conveyors travel and within which the cups become filled, and means for effecting water-tight engagement between the aligned cups.

2,098,754

AUTO TOP MATERIAL

Max N. Nickowitz, Bridgeport, Conn., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

Application February 5, 1934, Serial No. 709,852
8 Claims. (Cl. 154—40)



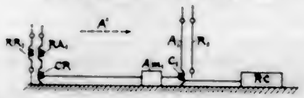
6. The process of preparing auto top material which comprises combining two fabric sheets with rubber cement, coating the combined fabrics with a rubber composition including oil and softener, calendering, applying a varnish coat of an oil modified polyhydric alcohol-polybasic acid resin composition, spraying melted aluminum on said varnish coat until a pliable continuous impervious coat of aluminum has been deposited, heating the coated material at 250° F. for 2½ hours and applying a protective surface coat of varnish.

2,098,755

TRANSMISSION BELT AND JOINT THEREFOR

Charles L. Paulus, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware

Application June 25, 1936, Serial No. 87,264
8 Claims. (Cl. 24—31)



2. In combination, a belt having its ends connected together to form a substantially endless band, a metal wire member extending longitudinally within the belt inwardly of the ends thereof, means for securing portions of the belt adjacent the ends thereof to said wire member for connecting the ends of the belt together, means passing through and attached to the belt for rigidly clamping other portions of said wire member to the belt beyond said secured portions of the belt to the wire member, and said last named means being located near the ends of said belt and spaced from the point of security of the belt to the wire member adjacent the belt ends.

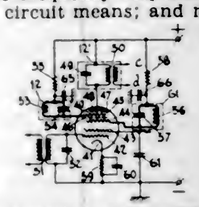
2,098,756

DIRECTIVE WIRELESS SYSTEM

Jozef Piebanski, Warsaw, Poland, assignor to Radio Patents Corporation, New York, N. Y., a corporation of New York

Application November 2, 1934, Serial No. 751,228
In Poland November 4, 1933
13 Claims. (Cl. 250—11)

7. A directional receiving antenna system comprising a plurality of spaced antenna elements, means for combining the energy picked up by said elements in the required phase relationship for directive reception, means for amplifying the combined energy and means for radiating a portion of the amplified energy from a point lying substantially in a line joining the receiver and the transmitter whose signals are to be received whereby signals incident upon the system from said transmitter are differentially accentuated by regenerative action by said radiation.



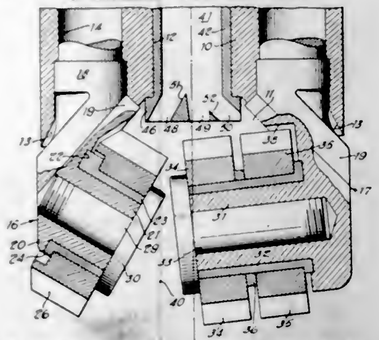
2,098,757

ELECTRIC CIRCUITS

Jozef Piebanski, Warsaw, Poland, assignor to Radio Patents Corporation, New York, N. Y., a corporation of New York

Application January 4, 1935, Serial No. 451. Renewed April 23, 1937. In Poland August 18, 1934
19 Claims. (Cl. 178—44)

17. In an electric filter, main circuit means having a predetermined frequency response characteristic; a plurality of auxiliary circuits having response characteristics differing from said main circuit means; means for producing a space discharge current; said main circuit means and said auxiliary circuits being connected through portions of said space current forming a coupling path therebetween, whereby said auxiliary circuits act as absorption circuits modifying the frequency response characteristic of said main circuit means; and means for substantially suppressing any coupling effect between said auxiliary circuit and said main circuit except as afforded through the medium of said space current.



2,098,758

ROLLER BIT

Clarence E. Reed, Wichita, Kans., assignor to Chicago Pneumatic Tool Company, New York, N. Y., a corporation of New Jersey

Original application December 6, 1933, Serial No. 701,115. Divided and this application May 5, 1936, Serial No. 77,902
3 Claims. (Cl. 255—71)

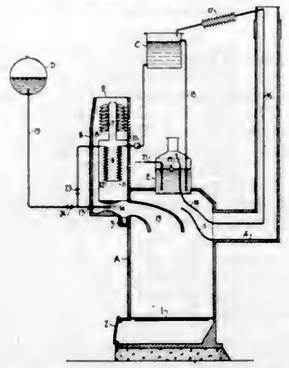
1. A roller boring drill comprising a bit head having at its lower end a downwardly diverging recess, a toothed roller cutter supported by the bit head in said recess, means for removing detritus from said cutter, said means comprising a plurality of flushing fluid outlets in the bit head, one of which is positioned at right angles to the cutter axis to discharge fluid in a radial direction against the cutter and another of which is positioned to discharge fluid tangentially of the cutter.

2,098,759

PRODUCTION OF THIO-ETHERS

Walter Reppe and Hanns Ufer, Ludwigshafen-on-the-Rhine, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application August 1, 1935, Serial No. 34,297. In Germany August 4, 1934
5 Claims. (Cl. 260—150)



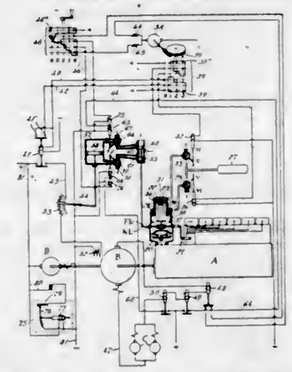
1. A process of producing thio-ethers which comprises reacting a compound of the general formula $CH_2{=}CHSO_x{-}R$ in which x stands for one of the numbers 1 and 2 and R stands for an organic radical selected from the group consisting of an aliphatic radical containing at least 6 carbon atoms and cyclic radicals with a compound containing at least one SH-group selected from the group consisting of hydrogen sulfide, alkyl, hydroxy alkyl, aralkyl and cyclic mono- and polyvalent mercaptans.

2,098,760

LIQUID FUEL BURNING INSTALLATION

Hendrik Arnold Romp, Voorburg, Netherlands, assignor to Shell Development Company, San Francisco, Calif., a company of Delaware

Application February 8, 1935, Serial No. 5,535
In the Netherlands February 15, 1934
3 Claims. (Cl. 122—1)



1. In a steam generating apparatus the combination comprising a heated liquid bath, a coil immersed in said bath, a water receptacle connected to said coil at one end of said coil said water receptacle being mounted at an elevation higher than said coil, a condenser discharging into said water receptacle, a water vaporizer connected to the inlet side of said condenser, an overflow pipe from said water receptacle to said water vaporizer and a conduit leading from the other end of said coil for a connection to an oil burner.

2,098,761

REGULATING DEVICE FOR A COMBUSTION POWER ENGINE COUPLED TO AN ELECTRIC GENERATOR FOR VEHICLES

Oskar Schläpfer, Winterthur, Switzerland, assignor to Sulzer Freres, Societe Anonyme, Winterthur, Switzerland

Application June 26, 1936, Serial No. 87,449
In Switzerland July 8, 1935
12 Claims. (Cl. 290—17)

1. In a vehicle drive control system, in combination with an internal combustion engine, an electric generator driven thereby and traction motors electrically connected to the generator, control means comprising a speed governor driven by said engine and controlling the fuel supply

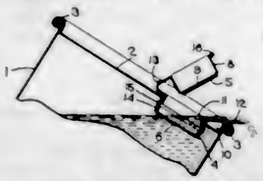
thereto, a plurality of springs for variably controlling the response of said governor to the engine speed, means for selectively bringing said springs into operation during a change from one operating speed to another and generator voltage regulating means for maintaining the power output of said engine approximately constant at each selected speed.

2,098,762

METHOD OF HARD BURNING DIATOMACEOUS EARTH

Richard W. Schmidt, Redondo Beach, Calif., assignor to The Dicalite Company, Los Angeles, Calif., a corporation of Delaware

No Drawing. Application December 12, 1935, Serial No. 54,089
5 Claims. (Cl. 252—2)



1. The method of producing a superwhite calcined diatomaceous earth which comprises: calcining said earth with from 1% to 7% by weight of a water-soluble salt of an alkali metal to a temperature not below 2000° Fahr., and preventing material fritting of said earth by the addition thereto of an oxide of a metal selected from the group consisting of calcium, magnesium, and barium in quantity substantially equal to that of said alkali-metal salt.

2,098,763

CAN OR CONTAINER

Harry Sebell, Boston, Mass., assignor of one-half to Arthur H. Parker, Lexington, Mass.

Application March 26, 1937, Serial No. 133,194
6 Claims. (Cl. 221—11)

1. A can having one end thereof deformed to present an annular wall extending at right angles to the can end, the portion of the can end within said wall being provided with an annular line of weakness, a sleeve member concentric with said wall and beaded thereto, and a closure member hingedly connected to the sleeve member and permanently connected to the portion of the can end surrounded by the line of weakness whereby said portion of the can end may be torn free thereby forming a pouring opening by application of force to the closure member.

2,098,764

PROCESS OF MANUFACTURING CREAM CHEESE

Caspar P. Sharpless, Swarthmore, Pa., assignor to Milk Processes, Inc., Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application November 25, 1935, Serial No. 51,499
10 Claims. (Cl. 99—116)

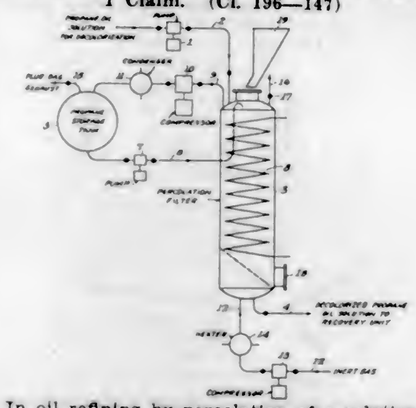
10. In a process of manufacturing a cream cheese, the steps comprising compounding a butter fat containing material consisting of a source of butter fat having a butter fat content of over 65% with materials consisting essentially of casein, starter and water, and thoroughly mixing said ingredients by discharging from a pressure of 100 to 1000 pounds per square inch to atmospheric pressure.

2,098,765

PROCESS OF MANUFACTURING CREAM CHEESE PRODUCTS

Caspar P. Sharpless, Swarthmore, Pa., assignor to Milk Processes, Inc., Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application January 17, 1936, Serial No. 59,602
3 Claims. (Cl. 99—116)



1. A process of manufacturing a cream cheese which comprises intimately mixing materials comprising neutralized sour cream with cottage cheese and edible acid in substantially the ratio desired in said finished cream cheese, and cooling the composition resulting from the mixing operation.

2,098,766

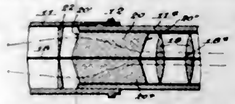
METHOD OF RECHARGING A PRESSURE FILTER

Claude F. Tears, Warren, Pa., assignor to The Petroleum Processes Corporation, Wichita, Kans., a corporation of Kansas

Application May 13, 1936, Serial No. 79,442
1 Claim. (Cl. 196—147)

In oil refining by percolation of a solution of oil in liquefied normally gaseous hydrocarbon solvent under pressure through a bed of adsorbent decolorizing medium, the method of recharging a pressure filter, which comprises washing the bed of adsorbent with liquefied normally gaseous hydrocarbon under pressure to free the adsorbent of oil, heating the bed to vaporize solvent retained in the adsorbent and withdrawing the vaporized solvent, reducing the pressure on the filter bed to complete vaporization of solvent, then forcing heated inert gas which will not form an explosive mixture with the vaporized solvent remaining in the filter through the bed to drive off solvent vapor retained in the adsorbent, opening the filter and replacing the exhausted adsorbent with fresh adsorbent and then closing the filter and flushing the contained air out of the same with a flow of inert gas before admitting any solvent for succeeding decolorizing operations.

2,098,767



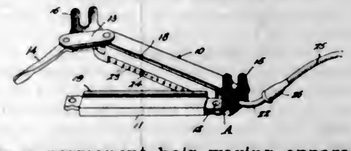
DOUBLE SIMULTANEOUS MOTION PICTURE APPARATUS

Richard Thomas, Los Angeles, Calif., assignor of one-half to William Jennings Bryan, Jr., Los Angeles, Calif.

Application March 18, 1935, Serial No. 11,701
5 Claims. (Cl. 88—16.6)

1. In a motion picture camera, the combination with separation corrective means, of a unit

equipped with means for bodily axial adjustment with respect to said means embodying a pair of chordally cut objective lenses with their optical axes close together, a septum between said lenses to maintain the light passing through one of said lenses separate from that passing through



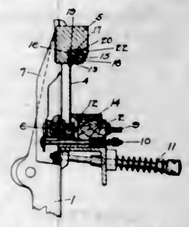
the other, and plano-parallel refractors mounted with their plane surfaces at an acute angle to the optical axes of the lens segments, said refractors positioned in the line of light passing through each of said lenses and adapted to deflect the light passing through each lens from that passing through the other.

2,098,768

AIR-COOLED PROTECTOR FOR PERMANENT HAIR WAVING APPARATUS

Generoso Turco, Brooklyn, N. Y.

Application April 23, 1937, Serial No. 138,544
2 Claims. (Cl. 132—36.1)



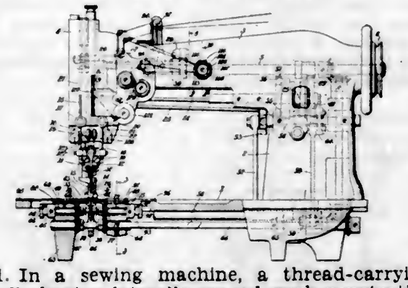
1. In a permanent hair waving apparatus, a protector including a pair of jaws for gripping a strand of hair therebetween, a pad member detachably associated with each jaw, one of said pad members having a recessed portion in the face which confronts the other pad member and being provided with a longitudinally extending duct having an inlet at one end for receiving cool air from a source of supply, and having a series of outlet ports leading downwardly at an angle therefrom and distributed along and opening through the recessed portion of said face to discharge cool air towards the scalp.

2,098,769

REED HOLDER FOR LOOMS

Samuel L. Webster, Hopedale, Mass., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine

Application March 4, 1937, Serial No. 129,005
5 Claims. (Cl. 139—188)



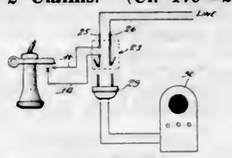
1. A loom lay including a hand rail having a longitudinal groove in its under side, a reed having a top rib positioned in said groove, a bar in said groove in front of said rib, and a plurality of springs carried by said hand rail and acting to urge said bar rearwardly to thereby hold said rib against the back wall of said groove.

2,098,770

SEWING MACHINE

Sydney Zonis, Bridgeport, Conn., assignor to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey

Application October 22, 1935, Serial No. 46,071
30 Claims. (Cl. 112—81)



1. In a sewing machine, a thread-carrying needle having laterally spaced work-penetrating movements followed by lateral movements into a substantially constant loop-presenting position, means for actuating said needle, a rotary looper complemental to said needle in the formation of chain-stitches, said looper having a loop-seizing beak and a loop-detaining wing constructed and arranged to enchain loops of thread presented to said looper by said needle, and means for rotating said looper.

2,098,771

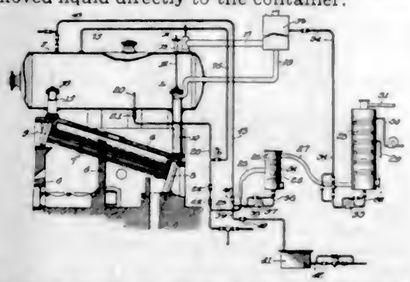
CIRCUIT CONTROL DEVICE

William Bogue, Chicago, Ill.

Application May 8, 1936, Serial No. 78,617
2 Claims. (Cl. 179—2)

1. In a circuit control unit an extension cord comprising a pair of conductors having a combined connector and receptacle at one end, said connector comprising a base having a plug-in contact and a receptacle contact electrically connected in series, a second plug-in contact and a second receptacle contact in said base and insulated from each other, a switch connected in series between said second contacts by means of said conductors, and means for mounting said switch on a telephone in cooperative relation with the usual receiver support, said switch being constructed and arranged to be opened and closed by the normal operation of said receiver support.

2,098,772



CONTINUOUS PRESSURE DISTILLATION PROCESS

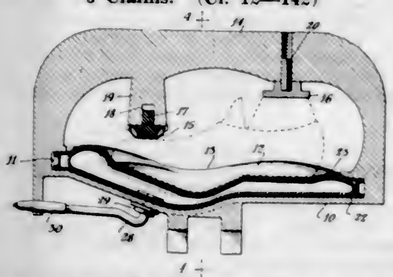
Oswald C. Brewster, Max G. Paulus, and Andrew E. Thompson, Casper, Wyo., assignors to Standard Oil Company, Whiting, Ind., a corporation of Indiana

Application February 13, 1928, Serial No. 253,976
19 Claims. (Cl. 196—48)

1. In apparatus for distilling hydrocarbon oils under pressure for the production of lighter hydrocarbon oils of the character of gasoline, a container, a bank of inclined tubes below said container, means for heating said tubes, upper

and lower headers communicating with the upper and lower ends of said tubes, conduits extending from said upper and lower headers into the said container, said conduits extending above the lowermost portion of said container, means for cutting off communication between the interior of the container and the conduit extending to the lower header, means for withdrawing liquid from the interior of said container, means for vaporizing a portion of the liquid so removed, and means for supplying unvaporized portions of removed liquid directly to the container.

18. A method of effecting the distillation of hydrocarbon oils under pressure for the production of low boiling hydrocarbon products such as gasoline which comprises maintaining a body of oil under pressure and at conversion temperature, continuously flowing oil to be subjected to conversion conditions through a heating zone wherein it is brought to conversion temperature and into said body of oil, continuously and separately removing evolved vapors from said oil body and passing them to a condensing operation, continuously removing liquid from said body of oil, reducing the pressure to vaporize a portion thereof, withdrawing evolved vapors from said body of oil and intimately contacting them with the liquid being vaporized, heating condensed fractions of said separately removed vapors heavier than the desired low boiling products and thereafter discharging them into said body of oil.



2,098,773

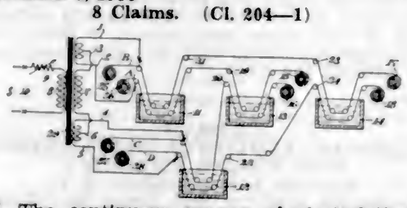
METHOD OF PRESSING SHOES

William C. Card, Jr., Winthrop, Mass., assignor to Compo Shoe Machinery Corporation, New York, N. Y., a corporation of Delaware

Original application March 11, 1931, Serial No. 522,738. Divided and this application June 19, 1935, Serial No. 27,288

3 Claims. (Cl. 12—142)

1. A method of affixing soles to shoes which comprises, locating an outer sole on a lasted upper with adhesive therebetween, loading the lasted shoe between an immovable support and an inflatable pad, keeping said support immovable throughout successive loading operations, and inflating said pad through a vertical displacement sufficient to enable it to press the sole against the lasted upper and to compensate by inflation alone for substantial variations in employed last sizes.



2,098,774

ELECTROLYTIC CONDENSER

Philip Ray Coursey, Surrey, England, and Clifford Herbert Marcus, New York, N. Y., assignors to Dubilier Condenser Corporation, New York, N. Y., a corporation of Delaware

Application January 12, 1933, Serial No. 651,248 In Great Britain January 16, 1932. Renewed October 6, 1936

8 Claims. (Cl. 204—1)

1. The continuous process of electrolytically forming oxide coatings upon aluminum surfaces which comprises treating at least four aluminum elements in the following manner: immersing the first and second elements as a pair in an electrolytic solution and establishing primary alternating potential therebetween of sufficient strength to form a film upon said elements; immersing the third and fourth elements as a pair in a second electrolyte solution and establishing a second primary alternating potential therebetween of sufficient strength to form a coating upon said elements, establishing a secondary alternating potential of substantially greater magnitude than said primary potential between the first named pair and a second named pair, removing the elements from their respective baths; immersing said first element and said third element as a pair in an electrolytic solution whereby said pair will be subjected to an electrolytic treatment due to the action of said secondary potential and similarly immersing said second and fourth elements in an electrolytic bath whereby a similar treatment is effected.

2,098,775

METHOD OF TREATING CELLULOSIC MATERIALS

Denis de Goencz and Edmund C. Tarnuzzer, North Adams, Mass., assignors to Arnold Print Works, North Adams, Mass., a corporation of Massachusetts

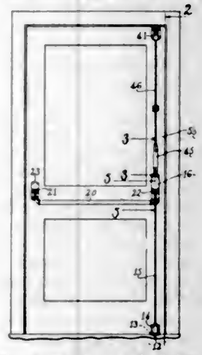
No Drawing. Application December 9, 1933, Serial No. 701,730

8 Claims. (Cl. 8—20)

1. A method of treating cellulosic material which comprises applying to the material a normally inactive cellulose solvent composed essentially of a cuprammonium salt in aqueous ammonia and thereafter treating the material containing such solvent with a solvent activating agent.

2,098,776

BOLT CUSHIONING MEANS FOR LOCKS



William S. Edwards, Hamden, Conn., assignor to Sargent & Company, New Haven, Conn., a corporation of Connecticut

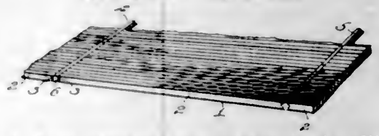
Application June 8, 1936, Serial No. 84,095

12 Claims. (Cl. 292—92)

1. A door lock comprising a lock bolt positioned adjacent the edge of a door, actuating mechanism

secured to the door at a point remote from said bolt for controlling the same, connecting means between said actuating mechanism and the bolt,

and pneumatic means carried by the door and engaging a part of said connecting means to retard the movement of the bolt to protracted position.



2,098,777

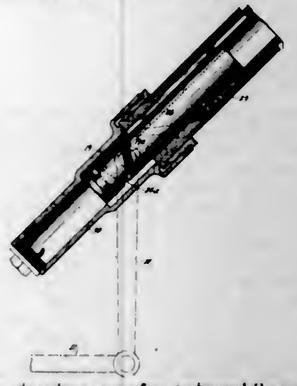
FLEXIBLE BOARD WOOD FLOOR COVERING

Armin Elmendorf, Chicago, Ill.

Application September 13, 1935, Serial No. 40,390

10 Claims. (Cl. 20—6)

6. A floor covering comprising a plurality of panels arranged edge to edge, each panel containing a flexible backing and thin, narrow, parallel strips of wood lying close together and glued to the backing, and wood strips between and glued to the wood and the felt at the meeting edges of the panels.



2,098,778

STEERING DEVICE FOR AUTOMOBILES

William H. Furness, Riverton, N. J., assignor to American Rayon Company, Inc., Riverton, N. J., a corporation of New Jersey

Application August 15, 1934, Serial No. 739,881

14 Claims. (Cl. 74—500)

1. In a steering gear for automobiles, the combination of a steering rod, a rock shaft, and a quick acting irreversible driving connection therebetween comprising two interfitted portions one of which is a cylindrical member having a peripheral curved slot which if developed in a flat plane would be an arc of a circle, and the other of which fits the slot and is fixedly carried by the rock shaft axially thereof.

2,098,779

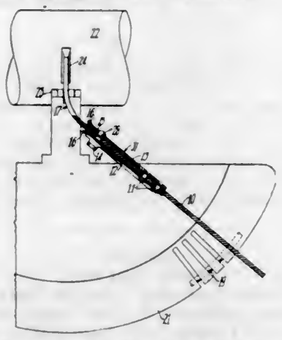
PURIFICATION OF AQUEOUS LIQUIDS FROM PHENOLS AND OTHER ACCOMPANYING SUBSTANCES

Paul Hermann Gericke, Paul Herold, Helmut Kratz, and Eberhard Vogt, Leuna, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort-on-the-Main, Germany

No Drawing. Application September 5, 1935, Serial No. 39,302. In Germany September 28, 1934

7 Claims. (Cl. 260—154)

1. A process for the purification of aqueous liquids from phenols and other accompanying substances comprising tarry constituents which comprises treating such aqueous liquids with a solid adsorption agent, the said phenols and other accompanying substances thereby being adsorbed by the said adsorption agent and thereupon extracting the adsorbed phenols from the solid adsorption agent containing the same by treatment with liquid ammonia.



2,098,780

TYPEWRITING MACHINE

William F. Helmond, West Hartford, Conn., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware

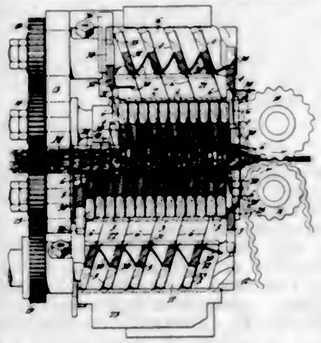
Application October 24, 1935, Serial No. 46,461

7 Claims. (Cl. 197—36)

1. A separable type-bar for a typewriter, comprising a hub-member having a socket fixed to one end thereof, said socket including a channel, the sides of which embrace the hub-member, and a plate-spring opposing the web of the channel and forming one side of the socket, a type-carrying member arranged to be inserted into said socket, and means co-operating with said yieldable side to retain said type-carrying member in position in said socket.

2,098,781

GILL-DRAWING FRAME



Willie Holdsworth, Seekonk, Mass.

Application April 27, 1936, Serial No. 76,549

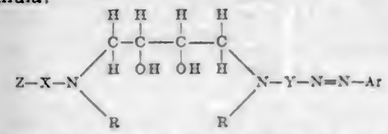
10 Claims. (Cl. 19—129)

1. In a device for cleaning the faller-teeth in gill-drawing frames, flexible means projecting

laterally from the faller-bars and adapted to wipe

along the teeth of adjacent bars during the movement of the fallers in the machine.

2,098,782



AZO DYESTUFFS

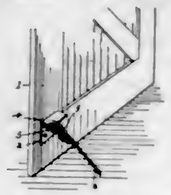
Heinrich Hopff and August Weickmann, Ludwigshafen-on-the-Rhine, Germany, assignors to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application December 18, 1935, Serial No. 55,042. In Germany December 20, 1934

4 Claims. (Cl. 260—77)

1. Azo dyestuffs corresponding to the general formula:

in which the R's stand for members of the group consisting of hydrogen and alkyl, cycloalkyl, aralkyl and aryl radicals free from sulfonic acid groups, X and Y stand for radicals of the benzene series free from sulfonic acid groups, Ar stands for an aryl radical free from sulfonic acid groups, and Z stands for a member of the group consisting of hydrogen and the group —N=N—Ar.



2,098,783

DOOR HOLDER

Ralph Hornung, Detroit, Mich.

Application November 5, 1936, Serial No. 109,247

1 Claim. (Cl. 292—338)

A device for the purpose described including a bracket member adapted to be secured to the inner face of a swinging door adjacent its outer end and lower corner, a horizontally disposed loop having spaced apart side legs and an outer curved end connecting said legs, said loop being secured at the ends of its legs to said bracket, and a prop member of extended length having a longitudinal slot adjacent its upper end through which slot said loop extends for pivotally attaching said prop to said door and for permitting lateral movement of said prop along said loop around said curved end thereof to extend outwardly from said door radially from said bracket with its free end in engagement with the surface over which the door swings and follow the path of swinging movement of the door, said prop being movable longitudinally by reason of the engagement of said loop with said slot, to permit said prop to be swung upwardly and then moved endwise to engage its slotted end within said loop and hold said prop in inoperative position, said bracket being provided with an abutment flange extending outwardly over and in spaced relation to said loop, whereby said prop when in operative position to hold said door in open position, will abut at its slotted end said abutment flange which flange will take the thrust of said prop.

2,098,784

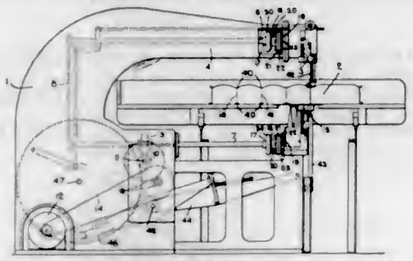
BAKING UTENSIL

Herbert J. Krause, Huntington, and Paul R. Simmons, Marion, Ind., assignors, by direct and mesne assignments, to Simmons Paper Products, Inc., Warsaw, Ind., a corporation of Indiana

No Drawing. Application September 9, 1935, Serial No. 39,730

2 Claims. (Cl. 53—6)

1. A baking utensil comprising a plate consisting of paper stock of absorptive properties having on its inner face only a glass-like continuous coating of the dried residue of a solution of an alkali metal silicate and an acid selected from the group consisting of citric and tartaric acids.



2,098,785

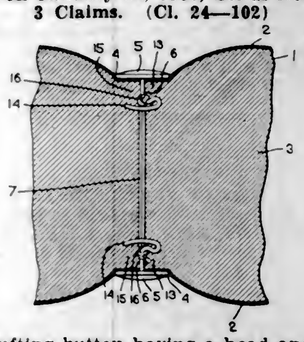
TUFTING MACHINE

Wilfred B. Mathewson, North Weymouth, Mass., assignor to United Mattress Machinery Company, Quincy, Mass., a corporation of Maine

Application December 28, 1936, Serial No. 117,689

3 Claims. (Cl. 112—3)

1. A tufting machine having two knotters, a driving shaft for each knotter which makes one revolution for each knotting cycle, each driving shaft comprising a driving section, a driven section and a slip clutch connecting said sections, said slip clutch having a limited torque resistance and being operative to establish a driving connection between the driving and driven shaft sections when they have a predetermined relative angular position only, whereby when either knotter meets with abnormal resistance the corresponding clutch will slip and allow the driving section of the corresponding driving shaft to continue its rotation and upon the next rotation of the driving section the two shaft sections will be coupled in their correct predetermined angular position.



2,098,786

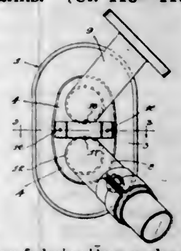
TUFTING BUTTON

Wilfred B. Mathewson, North Weymouth, Mass., assignor to United Mattress Machinery Company, Inc., Quincy, Mass., a corporation of Maine

Application January 14, 1937, Serial No. 120,519

3 Claims. (Cl. 24—102)

1. A tufting button having a head and a wire shank formed with a knot-receiving stem portion extending at substantially right angles from the head, said wire shank being bent laterally in one direction from the outer end of the stem portion and then formed into a return bend extending in the other direction beyond the stem portion said return bend being spaced from the laterally bent portion in the direction of the length of the stem.



2,098,787

METHOD OF FABRICATING AN AUTOMOBILE HEATER

Arthur W. McNeish, Detroit, Mich.

Application July 23, 1937, Serial No. 155,158

5 Claims. (Cl. 113—118)

1. A method for fabricating a sheet metal automobile heater of the type comprising a sheet metal casing through which the exhaust gases of the motor are passed in heat exchange relation but out of communication with the air to be heated, a sheet metal closure plate for the end of said casing having an opening therein and a pipe adapted to fit in the opening in the end plate and connect with the exhaust passageway of the motor to conduct the exhaust gases from the motor into the said casing, said method comprising the steps of inserting the exhaust pipe in the opening in the end plate, positioning the said pipe in a predetermined position with respect to the said end plate and so that it will connect with the motor exhaust passageway, and while the pipe is thus positioned welding a metal bridge member to the said pipe and closure plate at points spaced from the joint between the pipe and the opening in the end plate, and thereafter brazing the said pipe in the opening in the end plate to secure an air-tight joint between the end plate and the pipe and to fix the pipe in the said opening.

2,098,788

LEATHER SUBSTITUTE

Russell Morgan, Drexel Hill, Pa., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 31, 1935, Serial No. 47,615

5 Claims. (Cl. 91—68)

1. The method of preparing a leather substitute which comprises making an artificially sueded material by disposing a rubber composition on a pliable base material and thereafter flocking the rubberized surface to provide a nap, vulcanizing to securely fix the flock, submerging the nap in a sufficient amount of a coating of a rubber composition which contains fillers to produce a non-sueded surface and to provide a bulky and wear resistant coating, smoothing and vulcanizing the last applied rubber thereby preventing any napping of the flocked surface.

2,098,789

LEATHER SUBSTITUTE

Russell Morgan, Drexel Hill, Pa., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 31, 1935, Serial No. 47,616

5 Claims. (Cl. 91—68)

1. The process which comprises impregnating a square weave unnapped cotton fabric weighing 5⅓ ounces per linear yard of 38 inch width with a gasoline dispersion of

	Parts by weight
Rubber	40
Factice (white)	10
Barytes	15
Lithopone	30
Magnesium carbonate	10
Pigment	1

removing the gasoline, coating one face of the impregnated fabric with a dispersion of one part of cotton flock and three parts of a composition consisting of

	Parts by weight
Rubber	40
Factice (white)	10
Barytes	15
Lithopone	30
Magnesium carbonate	10
Pigment	1

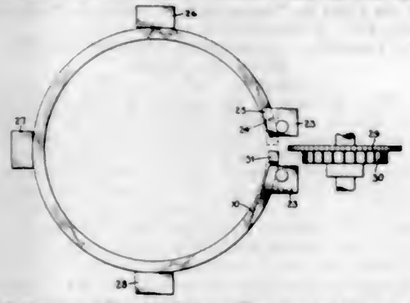
calendering the coated impregnated fabric, coating the calendered, coated impregnated fabric with a cement consisting of dispersing agent and

	Parts by weight
Rubber	40
Factice (white)	10
Barytes	15
Lithopone	30
Magnesium carbonate	10
Pigment	1

dusting the coated, calendered, coated, impregnated fabric to avoid a tacky surface and vulcanizing.

2,098,790

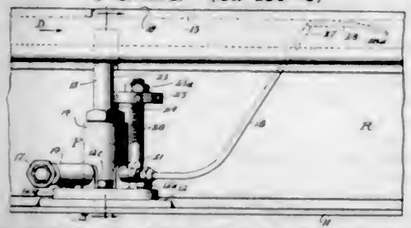
METHOD OF MAKING PISTON RINGS



Robert S. Newton, Watertown, N. Y., assignor to The New York Air Brake Company, New York, N. Y., a corporation of New Jersey

Application January 22, 1934, Serial No. 707,675

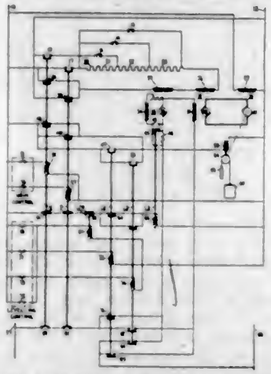
6 Claims. (Cl. 29—156.6)



1. A method of making a lap joint piston ring which comprises splitting an unbroken ring,

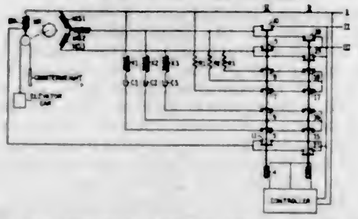
forming a leg at one side only of the split by a milling operation, then removing a portion of the ring at the opposite side only of the split,

and forming by another milling operation a leg complementary to the first mentioned leg at the end left by the removal of said portion.



2,098,791
RAIL LUBRICATOR
Henry J. Perazzoli, Philadelphia, Pa., assignor to Railway Track-work Company, Philadelphia, Pa., a corporation of Pennsylvania
Application March 27, 1936, Serial No. 71,081
4 Claims. (Cl. 184—3)

1. A device for lubricating a rail including, in combination with a rail having a groove to receive wheel flanges, a lubricant passage formed in a side face of the rail groove, means for spreading lubricant on the side face of the rail groove including a groove formed in said side face, and pump means for delivering lubricant to said passage including an operating element positioned in the base of the rail groove, said operating element and the spreading means being actuable by contact with the periphery of a wheel flange and the side face of a wheel flange, respectively, during passage of a wheel along the rail, and the operating element being offset from the spreading means lengthwise of the rail in a direction in advance of the spreading means with respect to the normal direction of travel on the rail.



2,098,792
CONTROL SYSTEM FOR ELEVATORS
Anthony Pinto, New Rochelle, N. Y., assignor to Otis Elevator Company, New York, N. Y., a corporation of New Jersey
Application November 13, 1936, Serial No. 110,585
11 Claims. (Cl. 172—152)

11. In combination; an elevator car; a direct current hoisting motor therefor; a direct current generator for supplying current to said motor, said generator having a main separately excited field winding and an auxiliary separately excited field winding; means for connecting said main field winding to a source of direct current to effect movement of said car from one landing to another; means for disconnecting said main field winding and for connecting said auxiliary field winding to a source of direct current to level the car with the landing at which a stop is being made regardless of whether the car overruns or underruns the landing; means for causing the car to operate at two different levelling speeds, dependent upon the distance of the car from said landing during the levelling operation, said means comprising resistance in series with said auxiliary field winding and means for short-circuiting said resistance to effect a fast levelling speed and for

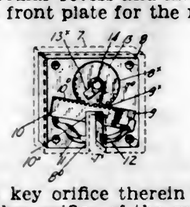
removing said short-circuit to effect a slow levelling speed; and means for overcoming the effects of residual flux of said generator during levelling, said last named means comprising an auxiliary direct current generator having an armature connected in series with said auxiliary field winding, a separately excited field winding connected in series with said main field winding, an additional field winding, and means for connecting said additional field winding across the armature of said auxiliary generator while said short-circuit for said resistance is removed.

2,098,793
ALTERNATING CURRENT MOTOR CONTROL
Anthony Pinto, New Rochelle, N. Y., assignor to Otis Elevator Company, New York, N. Y., a corporation of New Jersey
Application January 16, 1937, Serial No. 120,844
3 Claims. (Cl. 172—152)

3. In an elevator system; an elevator car; a counterweight therefor; a three phase squirrel cage induction motor for raising and lowering said car and counterweight; a source of three-phase alternating current; means for connecting the stator windings of said motor to said source and for disconnecting it therefrom; a plurality of condensers; a plurality of inductances; means for connecting said condensers, with said inductances in series therewith, across the stator windings of said motor to provide excitation for said motor when it is disconnected from said source, causing it to act as a generator; a plurality of resistances; and means for connecting said resistances across the stator windings of said motor when thus excited to dynamically brake said motor, the value of said inductances and the capacity of said condensers being such as to cause excitation of said motor at the fundamental of the frequency of the motor E. M. F. to effect the greatest dynamic braking action over the longest period when the motor is lowering full load and to prevent excitation of said motor at harmonics of said fundamental frequency and reduce the value of current due to such harmonics to a low value.

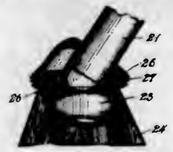
2,098,794
LOOSE-LEAF DEVICE
Abraham M. Rabinof, New Rochelle, N. Y.
Application January 6, 1936, Serial No. 57,793
5 Claims. (Cl. 129—24)

5. In a loose-leaf book having a pair of covers joined by a flexible middle portion, a housing on the innermost face of the middle portion and open at the side towards said face, separable split ring means extending through the base of the housing, depressing means secured to said flexible middle portion and operatively engageable with said split ring means for causing them to separate, and an exposed button attached to said depressing means and adapted to receive manual pressure thereupon for flexing said middle portion inwardly of the book and operatively actuating the depressing means.



2,098,795
WIRE CUTTER
Martin L. Rowe, Chicago, Ill., assignor to The Gerrard Company, Inc., Chicago, Ill., a corporation of Delaware
Application May 22, 1936, Serial No. 81,220
2 Claims. (Cl. 30—1)

1. A one-piece wire cutter comprising a single thin flat metal disk which is provided about its periphery with a number of radial slots and is characterized by opposed finger-engaging surfaces by means of which the disk may be gripped adjacent any one of the slots and twisted back and forth with considerable leverage whereby to cause a wire positioned in such adjacent slot to be broken by the abrupt bending to which it is subjected by the edges of the slot.

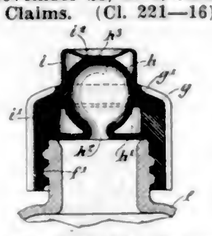


2,098,796
SWITCH LOCK FOR RAILWAYS
Albert Edward Shirley, Toronto, Ontario, Canada
Application May 20, 1936, Serial No. 80,751
1 Claim. (Cl. 246—400)

The combination with a switch stand, mast, and mast arm having a longitudinal slot extending through the bottom and front walls thereof and a rectangular recess in the front wall centrally of and at the upper end of the slot, and a switch lever pivoted between the side walls of the aforesaid slot, of a rectangular block held in the rectangular recess and having a vertical slot extending therethrough from the bottom of the block and registering with the slot of the mast arm, a transverse bolt receiving recess, the lower portion of which the vertical slot intersects, and a circular recess merging into the upper portion of the transverse recess, a gear fitting rotatably in the circular recess and having a key orifice therein, a front plate for the rectangular re-

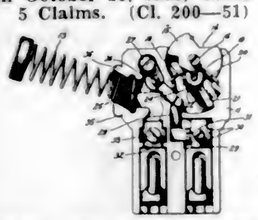
cess having a key orifice therein normally in a line with the key orifice of the gear, a bolt provided with a gear rack and meshing with the aforesaid gear and slidably fitting the transverse recess and normally extending across the upper portion of the vertical slot and against the front face of which the upper portion of the lever normally engages until the bolt is moved from its locking position to clear the lever end and permit its passage through the vertical registering slots of the front plate and block.

2,098,797
METHOD OF FORMING A SUCTION CLEANING DEVICE
Clarence Everett Stevens, Old Greenwich, Conn., assignor to Electrolux Corporation, Dover, Del., a corporation of Delaware
Application December 28, 1935, Serial No. 56,569
3 Claims. (Cl. 113—116)



1. A method of forming a brush having a suction passage through the same which comprises forming a cup from a blank, reversely pressing the bottom of the cup to provide spaced inner and outer walls with the outer walls formed to receive a brush member and with the inner wall formed to receive a suction pipe and to have applied thereto a member extending downwardly within the confines of said brush member, and cutting out the closed bottom of the inner wall to provide the suction opening passage through the device.

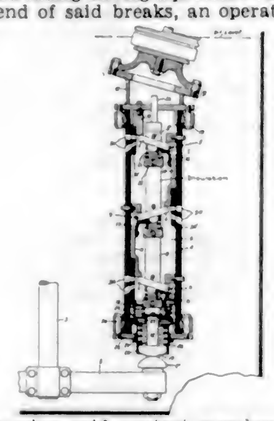
2,098,798
METHOD OF GRINDING DYESTUFFS
Irving T. Thornton, Buffalo, N. Y., assignor to National Aniline and Chemical Company, Inc., New York, N. Y., a corporation of New York
No Drawing. Application January 11, 1934, Serial No. 706,255
2 Claims. (Cl. 83—94)



1. The method of pulverizing a chemically sensitive dyestuff, which comprises grinding the dyestuff in admixture with solid carbon dioxide to the desired fineness and maintaining carbon dioxide present in solid phase throughout substantially the entire grinding process, whereby the dyestuff is maintained at a low temperature and is protected from oxidation and decomposition.

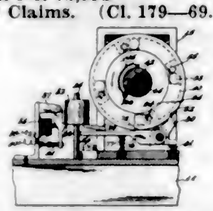
2,098,799
CLOSURE FOR CONTAINERS
Ralph W. Wilson, New York, N. Y.
Application November 23, 1935, Serial No. 51,208
3 Claims. (Cl. 221—16)

2. A closure comprising a closure member of yielding non-metallic material having an opening therein normally closed by the resiliency of the said material, and a non-yielding hollow cover in which the yielding closure is received, the cover being movably mounted and having a portion overlying the yielding closure member and formed with a central opening surrounding the dispensing opening in the said closure member whereby movement of the cover in one direction will cause separation of the yielding material at the dispensing opening.



2,098,800
CONNECTER
George B. Benander, Yalesville, Conn., assignor to General Electric Company, a corporation of New York
Application October 16, 1935, Serial No. 45,226
5 Claims. (Cl. 200—51)

1. An electric connecter comprising two complementary body members, a contact clip loosely mounted in said body members, a second contact clip and a stationary contact connected together and secured in one of said body members, a second stationary contact secured to one of said body members, a switch plate with angularly depending legs loosely mounted in said body members, a U-shaped switch contact journaled in depending bearings from said plate and adapted to bridge said stationary contacts, an operating handle secured at the top to one of said body members, and a spring interconnecting said operating handle and said switch contact.

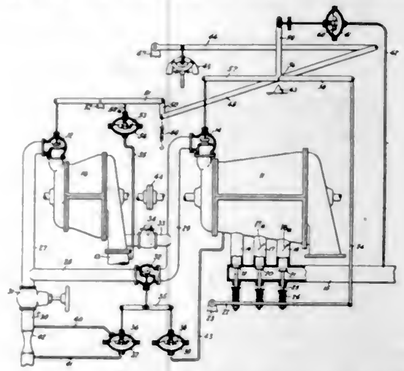


2,098,801
HIGH VOLTAGE ELECTRIC CIRCUIT INTERRUPTER
Henry V. Erben, Philadelphia, Pa., assignor to General Electric Company, a corporation of New York
Application March 12, 1937, Serial No. 130,505
8 Claims. (Cl. 200—150)

1. An electric circuit interrupter of the explosion chamber type comprising an insulating casing forming a pressure-confining chamber, an arc-extinguishing liquid substantially filling said chamber, a plurality of contact members, each pivotally mounted with respect to said casing disposed within said chamber, coacting fixed contact structure arranged to form with said contact members a plurality of breaks in series in the circuit, said casing having a pressure exhaust port opposite end of said breaks, an operating mem-

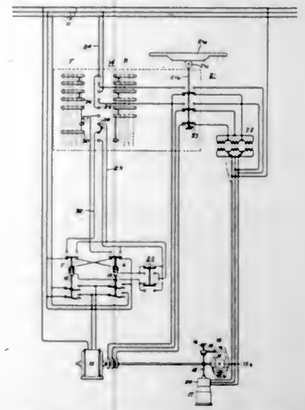
ber for moving said contact members substantially in unison, a butt contact connected in series with said contact members and carried by said operating member at one end of said chamber, and a movable switch member for coacting with said butt contact exteriorly of said chamber.

2,098,802
TELEPICTURE SYNCHRONIZING SYSTEM
William G. H. Finch, New York, N. Y.
Original application February 26, 1936, Serial No. 65,869, now Patent No. 2,047,863, dated July 14, 1936. Divided and this application April 6, 1936, Serial No. 72,991
8 Claims. (Cl. 179—69.5)



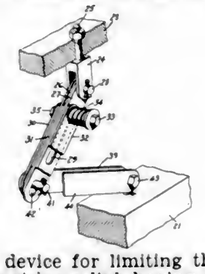
1. In a signalling system, a source of motive power; a driven member; a driving connection between said source of motive power and said driven member including means carried by said driving connection for disengaging said driving connection when said means is held against rotation; mechanism for arresting the rotation of said means when said driven member approaches a predetermined angular position; a synchronizing magnet responsive to received cyclic synchronizing signals; and a weight positioned above said mechanism, releasable by said magnet against said mechanism for rendering said arresting mechanism ineffectual during synchronous condition.

2,098,803
ELASTIC FLUID TURBINE ARRANGEMENT
Eugene E. Harris, Watervliet, N. Y., assignor to General Electric Company, a corporation of New York
Application January 15, 1936, Serial No. 59,263
8 Claims. (Cl. 60—67)



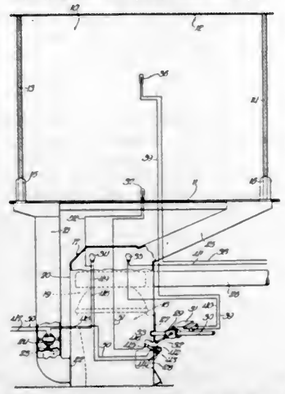
1. An elastic fluid turbine arrangement including the combination of a first and a second tur-

bine for furnishing a common load output, means for connecting the turbines in series and in parallel as regards the flow of elastic fluid there-



through, and means for automatically changing the connection from series to parallel connection as the load output rises beyond a fixed value.

2,098,804
CONTROL SYSTEM
Herbert Hootz, Berlin, Germany, assignor to General Electric Company, a corporation of New York
Application July 1, 1936, Serial No. 88,435
In Germany July 9, 1935
3 Claims. (Cl. 172—179)



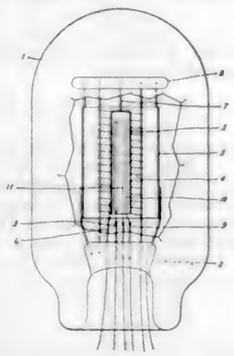
1. A motor control system comprising an alternating current induction motor, a mechanical brake for said motor biased to braking position, a multiposition master switch for controlling the operation of said motor, means for releasing said brake, means operable in the first running position of said master switch for connecting said brake releasing mechanism to the secondary winding of said motor thereby to produce a graduated braking action dependent upon the speed of said motor and responsive to operation to a running position beyond the first for disconnecting said brake releasing mechanism from said secondary winding and connecting it to said source to effect full release of said brake, and an auxiliary switching device operable upon return of said master switch to said first running position for establishing plugging braking connections for said motor.

2,098,805
SAFETY DEVICE
Sidney O. Huntington, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York
Application February 28, 1934, Serial No. 713,294
2 Claims. (Cl. 248—1)

1. A safety device for limiting the movement of a body comprising a link having one end to be connected to a fixed support, a plurality of other links, means including a bolt and a spring for fastening the other links to the first named link and causing adjacent surfaces of the links to contact each other with a predetermined force, said bolt projecting through bores and slots of varying lengths in the links, and means for connecting the plurality of links to the body whose movement has to be limited, the bolt connection through the slots of varying length permitting a stepped breaking of the friction of rest between the contacting link portions.

2,098,806
SYSTEM OF CONTROL FOR AIR CIRCULATING MEANS
David J. Jones, Elmhurst, Ill., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application October 12, 1935, Serial No. 44,749
5 Claims. (Cl. 236—11)

4. In a system for controlling the temperature of a space, means for circulating air through said space, means for varying the temperature of said air, a regulator for said temperature varying means movable between heat increasing and heat decreasing positions, a first temperature responsive device responsive to the temperature at an intermediate level in said space, a second temperature responsive device responsive to the temperature at a lower level in said space, a third temperature responsive device responsive to the temperature of the air adjacent said temperature



varying means, transfer means which when in a first position places said air circulating means under the control of said second temperature responsive device and when in a second position places said air circulating means under the control of said third temperature responsive device independently of said second temperature responsive device, and means including said first temperature responsive device operative upon the temperature at said intermediate level falling below a predetermined value to cause said transfer means to move to its second position and to cause said regulator to move to its heat increasing position and upon the temperature at said intermediate level rising above a predetermined value to cause said transfer means to move to its first position and said regulator to move to its heat decreasing position.

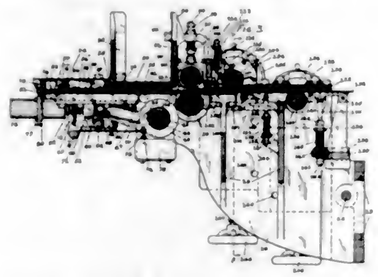
2,098,807

ELECTRICAL DISCHARGE APPARATUS

Johan Lodewyk Hendrik Jonker and Karel Marinus Van Gessel, Eindhoven, Netherlands, assignors to Radio Corporation of America, a corporation of Delaware

Application March 22, 1932, Serial No. 600,456
In the Netherlands March 24, 1931
1 Claim. (Cl. 250—27.5)

An electric discharge device comprising an envelope containing a cylindrical anode, a helical grid and an indirectly heated cathode of cylindrical configuration, a plurality of heaters within the cathode cylinder and the space between said heaters and the cylinder being substantially free of insulating material, one of said heaters having the proper electrical characteristics to carry the heating current during normal operation of the device and another of the heaters having the proper electrical characteristics to carry a larger heating current during evacuation of the device, said last-mentioned heater remaining idle during the normal operation of the discharge device, said heaters having substantially the same shape but different dimensions, and one of said heaters being arranged within another heater.



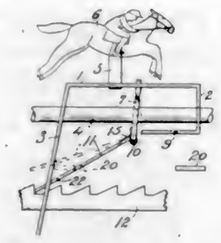
2,098,808

SIZING MACHINE FOR BATTERY GRID PLATES

Arthur D. Lund, Minneapolis, Minn.

Application December 23, 1935, Serial No. 55,855
19 Claims. (Cl. 90—11)

1. A grid plate sizing machine comprising a plate passageway defined in part by a pair of co-operating power driven feed rolls arranged to receive the grid plates therebetween and advance them through the passageway, and a pair of ro-



tary trimmers disposed at opposite sides of the passageway and adapted to extend transversely across and act on opposite surfaces of the grid plates as they advance under the feed roll action.

2,098,809

RACING AMUSEMENT DEVICE

Clarence W. Musser, Kansas City, Mo.

Application May 31, 1935, Serial No. 24,270
8 Claims. (Cl. 273—86)

1. In a device of the kind described, the combination with a supporting bar, a carrier reciprocative on said supporting bar, a locking member engaged by and movable with said carrier and slidably reciprocative on said bar and tiltable thereon to and from a locking position in which it will hold said carrier from forward but will permit its rearward movement, a forwardly and rearwardly reciprocative ratchet member, and a pawl engageable and movable forwardly by said ratchet member and engaging said locking member for releasing said locking member and moving it and said carrier forwardly, of a spring engaging said locking member and said pawl and holding them tightly engaged with each other, and having a tension normally forcing said pawl into operative engagement with said ratchet member and said locking member toward the locking position, and resilient means operable independently of said pawl for normally forcing said locking member to the locking position.

2,098,810

DIVIDED SKIRT

Selda K. Pierce, Brookline, Mass.

Application May 12, 1937, Serial No. 142,140
3 Claims. (Cl. 2—214)

1. A divided skirt comprising an upper portion shaped to fit the waist and hips of the wearer, and a pair of depending trunk portions joined at the crotch of the garment, each of said trunk portions comprising two pieces of material joined by seams extending, respectively, along the side of the garment on the outside of the trunk portion, and along the center of the trunk portion

at the inside thereof, and said crotch extending in a diagonal direction from front to rear of the garment so that the trunk portions substantially overlap each other, both front and rear, the visible lines of the division therebetween being substantially offset from the median line of the garment, so that the garment presents the appearance of an ordinary skirt.

2,098,811

COMPOSITE BODY

Hans Pulfrich, Berlin-Wilmersdorf, Germany, assignor to General Electric Company, a corporation of New York

No Drawing. Application July 16, 1935, Serial No. 31,719. In Germany July 25, 1934
5 Claims. (Cl. 49—81)

4. A composite body comprising a glass member and a member composed of a ceramic material having as main components magnesium oxide and titanium oxide, said members being fusion-welded to one another.

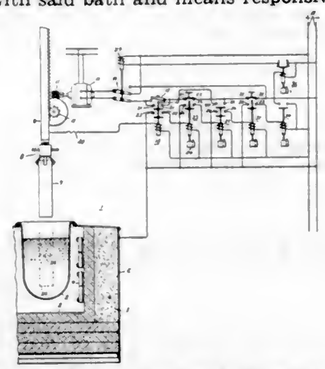
2,098,812

CERAMIC MATERIAL

Hans Pulfrich, Berlin-Wilmersdorf, Germany, assignor to General Electric Company, a corporation of New York

No Drawing. Application December 31, 1936, Serial No. 118,677. In Great Britain July 31, 1934
6 Claims. (Cl. 106—9)

1. A sintered ceramic material which is substantially impenetrable by gases and is adapted to be fusion-welded to glass and to form a vacuum-tight seal therewith, said material having a coefficient of linear thermal expansion not substantially exceeding 130.10^{-7} and including as one component an oxide of the group consisting of magnesium and beryllium, having as another component an oxide of the group consisting of titanium and zirconium, the mol. ratio of said first-named component to said last-named component being at least about 1 to 1, and having as a third component a siliceous ceramic bonding agent.



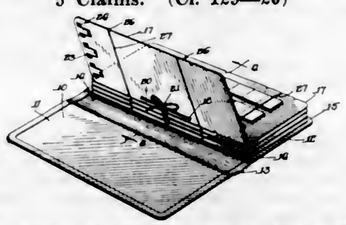
2,098,813

HEAT TREATING APPARATUS

Leon B. Rosseau, Lower Merion Township, Montgomery County, Pa., assignor to General Electric Company, a corporation of New York

Application November 24, 1936, Serial No. 112,529
4 Claims. (Cl. 266—5)

1. In combination, a molten bath, means for lowering an article into engagement with said bath to be heat treated therein, a circuit arranged to be closed by the contact of said article with said bath and means responsive to the



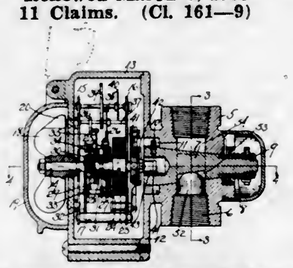
closing of said circuit for controlling the immersion of the article into the bath.

2,098,814

STAMP HOLDER

Charles A. Swanson, Chicago, Ill.

Application March 16, 1934, Serial No. 715,855
5 Claims. (Cl. 129—20)



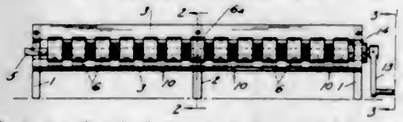
1. A stamp holder comprising a plurality of cards, a backing member, adjustable length means to detachably secure the cards together in book form upon the backing member, a cover for the cards and backing member, a pocket formed between said cover and said backing member, and clips on the cards adapted to detachably secure variable thickness sheets of stamps thereon.

2,098,815

SELF-ACTUATING VALVE

Anton Van Veen, West Hartford, Conn.

Application October 1, 1931, Serial No. 566,190
Renewed March 3, 1936
11 Claims. (Cl. 161—9)



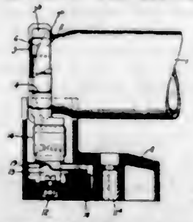
1. A self-actuating valve including a valve case with a valve therein, a spring for continuously rotating said valve during the period in which the valve is open, and a regulating mechanism including a spring actuated main arbor opera-

tively connected to said valve for operation thereof, means for operating said regulating mechanism by the turning movement of said valve, and an interruptable connection between said valve and said regulating mechanism to permit independent movement of said valve.

2,098,816
SPACING MECHANISM

Theodore K. Walma, Iowa City, Iowa

Application October 26, 1936, Serial No. 107,664
11 Claims. (Cl. 146—153)

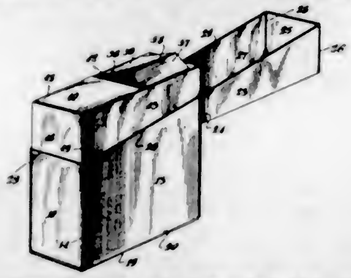


1. A mechanical movement comprising supporting means, a straight rod of non-circular cross-section supported thereby, sleeves surrounding said rod and slidable longitudinally thereof, said sleeves having their internal surfaces conforming substantially to the rod and fitting the same closely but sufficiently loosely to be freely slidable thereon, the external surfaces of the sleeves being threaded in opposite directions from opposite ends, longitudinally apertured blocks having their apertures threaded in opposite directions from opposite ends, the threads of the blocks cooperating with the threads of the sleeves to cause motion of both longitudinally of the rod when the latter is rotated, and guiding means for the blocks to support them and prevent their rotation around the rod.

2,098,817
INSULATED SUPPORT FOR LAMPS

Kurt Wiegand, Hohenneuendorf, near Berlin, and Friedrich Göritz, Berlin, Germany, assignors to General Electric Company, a corporation of New York

Application December 2, 1936, Serial No. 113,918
In Germany December 19, 1935
3 Claims. (Cl. 176—29)



3. A mounting device for a lamp of the character described, comprising a cap made wholly of insulating material comprising a disk portion and an elastic rim, a radially extending foot formed integral with the cap and provided with notches on opposite sides and an open slot at the bottom, said rim and foot having a second slot, and a contact spring which extends through the second slot, one end of the spring being located within the cap adjacent the disk portion and the other end located in said open slot in the bottom of the foot.

2,098,818
SEALED CONTAINER

Champe S. Andrews, North Chattanooga, Tenn.

Application June 9, 1932, Serial No. 616,253
5 Claims. (Cl. 229—17)

1. A sealed container of the character described, comprising in combination, an outer shell and a closed tubular member telescoped therein, said member having sealable flaps closing the opening through which the contents are inserted, a sealed but openable portion through which the contents may be removed, said outer shell having sealable flaps closing the opening through which the cellular member is inserted, the sealable flaps of the outer shell being on a

side other than a side overlying the sealable flaps of the tubular member and a sealed portion adapted to be separated from the main portion of the outer shell along a perforated line to provide a hinged cover therefor through which the contents may be removed, said member thereafter providing means for frictionally retaining the hinged cover portion in closed position.

2,098,819
CONTROL SYSTEM

Leslie R. Allison, Forest Hills, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application January 4, 1936, Serial No. 57,572
4 Claims. (Cl. 246—3)

1. In combination, a railway track formed into an insulated section, means to supply coded alternating current to the rails of said section, a code following relay receiving current from the rails of said section for operating a circuit controlling contact member, two control relays each provided with a particular predetermined slow-release period, said two relays proportioned differently to possess different slow release periods, circuit means including a direct current source and said contact member for supplying code impulses of current to the windings of said relays in multiple, two asymmetric units one for each relay and each unit interposed in series with the winding of the associated relay and said units both disposed with their forward direction toward the negative terminal of said direct current source whereby each of said relays is operated at its particular release period, and signaling means for governing traffic through said section controlled by said relays.

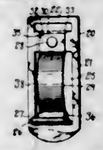
2,098,820
BROOCH

Morris Belloch, Brooklyn, N. Y.

Application April 16, 1937, Serial No. 137,348
6 Claims. (Cl. 63—20)

1. A brooch assemblage, comprising a pair of brooch members, each provided with a substantially flat clasp on the back thereof, and a spring clip device for securing said brooch members in abutting relationship, said spring clip device

comprising a generally flat body portion and a pair of gripping fingers carried by said body portion and resiliently urged toward said body por-



tion, for endwise sliding and resilient engagement, respectively, under the clasps on the back of the brooch members.

2,098,821
CLASP

Raymond W. Cook, Bristol, Conn., assignor, by mesne assignments, to Associated Spring Corporation of Delaware, Bristol, Conn., a corporation of Delaware

Application February 7, 1935, Serial No. 5,413
5 Claims. (Cl. 24—243)

1. A clasp comprising: a frame-member having an opening and a gripping-edge forming part of the border of said opening; a resilient metal or equivalent clasp-member rigidly secured to the frame-member and having a grip-tongue adjacent said gripping-edge and at one side of said frame-member when in unclasped position, the extreme end of said grip-tongue being located substantially beyond said opening and beyond said gripping-edge when in unclasped position and said grip-tongue being adapted to resiliently engage against and yieldably resist being pushed past said gripping-edge to gripping position adjacent said gripping-edge of said frame-member.

2,098,822
RAILWAY SIGNALING APPARATUS

Robert M. Gilson, Pittsburgh, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania

Application May 10, 1935, Serial No. 20,796
Renewed February 5, 1936
30 Claims. (Cl. 246—34)

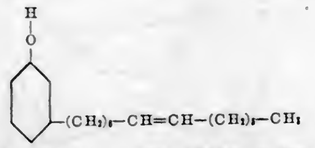
1. In combination with a section of railway track, a source of periodic current, means for connecting said source across the traffic rails of the section comprising a tuned circuit including a condenser in series with a first winding of a reactor having a magnetizable core, a track relay receiving current from the rails of said section, vehicle-carried means for supplying direct current to the traffic rails of said section for detuning said tuned circuit to increase the effective impedance thereof, and a second winding on said reactor arranged to receive direct current from said vehicle to control the flux in the core of the reactor and thereby aid the release of said track relay.

2,098,823
BOTTLE

Franklin C. Gurley, Hamburg, N. Y.

Application August 21, 1936, Serial No. 97,242
6 Claims. (Cl. 215—1)

5. An improved container comprising a hollow body portion formed entirely of moldable wax with a tubular neck of the same material projecting from said body portion, formed integrally therewith, and providing a passage for filling and emptying the chamber in said body portion, the exterior of said neck being threaded from its free end, and a removable closure cap with internal screw threads screwed over the outside of said neck and encasing the exterior of said neck from its free open end approximately to said body portion, protecting substantially the entire neck and its screw threads from external injury in handling, and closing the open end of said neck, but removable from said neck by unscrewing to enable access to be had to the interior of said body portion.



2,098,824
PROCESS OF DESTRUCTIVELY DISTILLING CASHEW NUT SHELL LIQUID

Mortimer T. Harvey, East Orange, N. J., assignor to The Harvel Corporation, a corporation of New Jersey

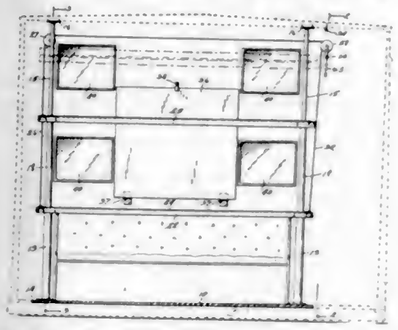
No Drawing. Application December 21, 1933, Serial No. 703,414
17 Claims. (Cl. 260—154)

1. The method which comprises removing from cashew nut shell liquid a phenolic product having a boiling point of about 360° C. at normal pressure and a boiling point of about 225° C. at a pressure of about ten millimeters of mercury by destructively distilling said cashew nut shell liquid.

14. A phenolic compound obtainable from cashew nut shell liquid and having the following identification: molecular weight 288; approximate empirical formula, $C_{20}H_{32}O$; structural formula,

index of refraction, N_D^{25} 1.5112; boiling point, about 225° C. at ten millimeters of mercury; melting point, below minus 20° C.; density, about 0.930 at 20° C.

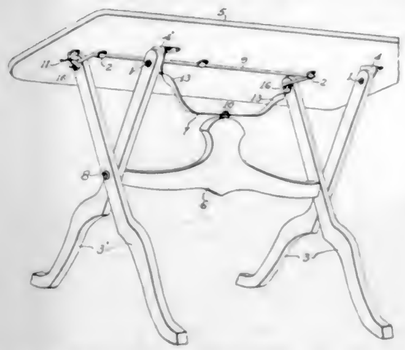
17. The method which comprises breaking down anacardic acid, identified as the major constituent of cashew nut shell liquid, with the aid of heat to produce a compound having the formula $C_{14}H_{27}C_6H_4OH$ and distilling off said compound.



2,098,825
BED SUPPORTING STRUCTURE FOR TRAILERS OR AUTOMOBILES

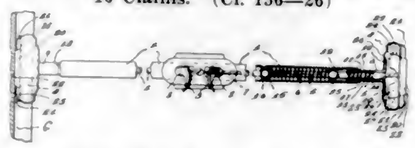
Ernest E. Hills, Oshkosh, Wis., assignor of one-third to Albert J. Ihrke, Oshkosh, Wis.

Application January 4, 1936, Serial No. 57,594
Renewed April 1, 1937
1 Claim. (Cl. 5—9)



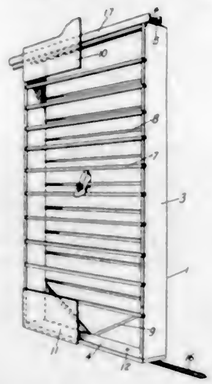
In a trailer, four posts, each formed of a lower section, an upper section and an intermediate

section, the sections being successively less in diameter, the intermediate section having reversely screw threaded engagement with the lower and upper sections, the upper and lower sections carrying at their ends attaching plates, a lower bed supporting frame slidably mounted upon the intermediate sections of the posts and limited in its downward movement by the upper ends of the lower sections, an upper bed supporting frame slidably mounted upon the upper sections and



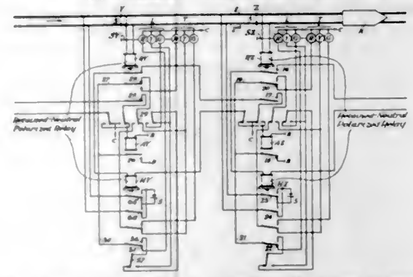
limited in its downward movement by the upper ends of the intermediate sections, and manually operable means for raising the lower section into engagement with the upper section and then raising both sections into the upper portion of the trailer, said means permitting the lowering of both bed frames until the upper bed frame is stopped from further movement and then lowering the lower bed frame until it is stopped from further lowering movement.

2,098,826
FOLDING TABLE
Karl G. Johanson, West Concord, Mass.
Application January 14, 1937, Serial No. 120,623
2 Claims. (Cl. 311—83)



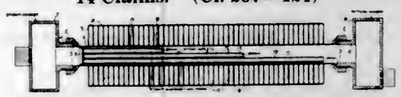
1. In a folding table having two pairs of crossed legs, the legs of one pair being pivoted to the other pair on a transverse axis intermediate their ends, a center-post pivotally connected to said pairs of legs on said axis, a flexible brace pivotally connected at its center to the middle of said center-post, one end of said brace being pivoted to a leg of one pair at one side of the table, and the other end of said brace being pivoted to a leg of the other pair at the other side of the table.

2,098,827
CURTAIN FIXTURE
John F. Levan, Elkhart, Ind., assignor to Excel Curtain Company, Elkhart, Ind., a corporation of Indiana
Application July 22, 1936, Serial No. 91,951
10 Claims. (Cl. 156—26)



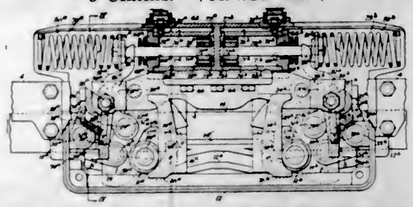
5. A curtain fixture comprising a sleeve to which the lower end of the curtain is secured, rods slidable in the sleeve and having pinch handles by which they are slidable axially inwardly, springs tending to thrust the rods axially outwardly, the rods being adjustable axially relatively to the pinch handles, a head swivelled on the end of each rod and having a stem encircling the end of the rod, a sleeve on the rod in abutting relation to the stem, a spring interposed between the stem and the sleeve and tending to thrust the stem away from the sleeve, the stem and the sleeve having interlocking means tending to hold the head and the rod from relative turning movement, when the head is slidably coacting with a curtain guide and the spring compressed and to permit relative turning movement when the head is out of the guide.

2,098,828
DISPLAY RACK
Arthur H. Ludwick, Danville, Ill.
Application July 24, 1936, Serial No. 92,397
1 Claim. (Cl. 211—34)



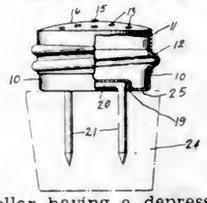
In combination with a pair of upper and lower vertically aligned guide members adapted to be secured respectively to vertical and horizontal surfaces, a vertically disposed rectangular box-like open rack frame provided on opposite sides with a series of vertically spaced article supports, the supports on one side being staggered with respect to the supports on the opposite side, the lower guide member being in the form of a track and the bottom wall of the frame being provided with rollers for engagement with the track, the upper guide member comprising a pair of spaced rails to receive the top member of the frame, whereby the frame is supported in vertical position for movement on said guide members.

2,098,829
RAILWAY SIGNALING
Ronald A. McCann, Swissvale, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application June 10, 1933, Serial No. 675,246
32 Claims. (Cl. 246—46)



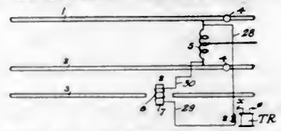
21. In combination, a section of railway track, a track circuit for said section including the traffic rails of the section and a pole-changer responsive to traffic conditions in advance of said section, a polarized relay energized by current supplied by said track circuit and having the characteristics of holding its front neutral contacts closed when the polarity of the energizing current is reversed and of retaining its back neutral contacts closed a predetermined interval after energizing current is supplied thereto, and a signal for said section having a stop circuit including a back neutral contact of said relay and a proceed circuit including a front neutral contact whereby signal flashing when the pole-changer is operated and momentary loss of control when a train vacates the section are avoided.

2,098,830
APPARATUS FOR THE HEATING OF AIR
John McElgin, Philadelphia, Pa., assignor to John J. Nesbitt, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application November 12, 1935, Serial No. 49,364
14 Claims. (Cl. 257—124)



1. In a radiator, spaced headers, an interconnecting main tube, and a plurality of interiorly disposed, steam distribution tubes in the main tube having their outlets disposed at different locations within said main tube.

2,098,831
RAILWAY SWITCH OPERATING APPARATUS
Kenneth J. J. McGowan, Swissvale, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application March 29, 1935, Serial No. 13,682
9 Claims. (Cl. 246—291)



2. In combination, a railway switch movable between two extreme positions, means for normally biasing said switch to a selected extreme position, means effective when said switch is moved away from said selected extreme position by a trailing train for biasing said switch to its opposite extreme position, and timing means set into operation when said second mentioned biasing means is actuated for terminating the effect of said second mentioned biasing means and for restoring the effect of said first mentioned biasing means at the expiration of a measured time interval.

2,098,832
SALTCELLAR
Arthur H. Payson, Norwich, Conn., assignor to The American Thermos Bottle Company, Norwich, Conn., a corporation of Ohio
Application September 25, 1935, Serial No. 41,966
6 Claims. (Cl. 65—45)

1. A saltcellar having a depressed portion in its outer base, a piercing attaching member supported at one end in said depressed portion, said attaching member being adapted to secure said saltcellar to a pierceable cap.

2,098,833
TRACK CIRCUIT SIGNALING SYSTEM FOR RAILWAYS AND THE LIKE
Leslie Hurst Peter, London, England, assignor, by mesne assignments, to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application March 16, 1935, Serial No. 11,375
In Great Britain March 17, 1934
11 Claims. (Cl. 246—37)

1. In a signaling system for electric railways employing the track rails as conductors of alternating signaling current and as the return conductor of the propulsion current circuit, a track relay having a winding connected across the track rails to render said relay responsive to alternating signaling current in the track rails, and means for preventing the response of the track relay to alternating current derived from the propulsion current circuit due to the connection of said winding to the track rails comprising an inductor having a winding electromagnetically coupled with the propulsion circuit and connected across the track rails in series with said track relay winding.

2,098,834
CLOTHESPIN OR LIKE ARTICLE
Henry J. Peterson, Webster City, Iowa
Application May 29, 1936, Serial No. 82,465
6 Claims. (Cl. 24—261)

1. In a clothespin constructed of a single strand of spring material, a circular upper

loop portion bent in the central portion of said strand, a downwardly extending finger portion extending from one end of said loop portion, a U-shaped portion having one of its ends extending downwardly from the other end of said

loop portion, having its two side lengths resting in spaced relationship at each side of said finger portion, and its free end bent inwardly to slidably engage solely the inner side of the end portion of said loop portion that extends into said finger portion.

2,098,835

EXTRACTING GOLD AND/OR SILVER FROM ORES, ETC.

Barclay K. Read, John S. Godard, and Wilfred N. Hall, Toronto, Ontario, Canada, assignors to E. I. du Pont de Nemours & Company, Inc., Wilmington, Del., a corporation of Delaware

No Drawing. Application April 2, 1935, Serial No. 14,374. In Canada May 2, 1934

2 Claims. (Cl. 75—2)

1. A method of extracting gold and/or silver from ores and other products from mining and metallurgical operations containing one or both of these constituents which comprises subjecting such ores and other products to the action of ammonia in conjunction with a cyanide compound, separating the tailings from the cyanide operation and subjecting said tailings to a flotation operation.

2,098,836

INSECTICIDE

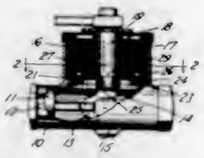
Ivan L. Ressler, Niagara Falls, N. Y., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application April 24, 1936, Serial No. 76,264

7 Claims. (Cl. 167—34)

1. An insecticidal composition containing nicotine and a hydrophilic polyvinyl compound.

3. An insecticidal spray composition comprising an aqueous solution of nicotine and polyvinyl alcohol.



2,098,837

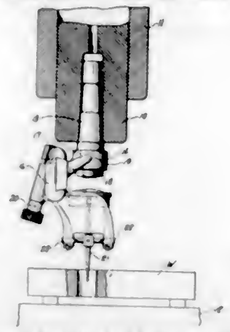
DOOR CLOSER

William Stanley Richmond, Hamilton, Ontario, Canada

Application May 21, 1937, Serial No. 143,968

7 Claims. (Cl. 16—59)

1. In a door closer of the class described including a diaphragm provided with an opening, a valve adapted to temporarily close the opening, and means for operating the valve to permanently clear the opening automatically upon the initial operation of the door closer.



2,098,838

WORK LOCATING INDICATOR FOR JIG BORING MACHINES

John M. Rusnak, West Hartford, Conn., assignor, by mesne assignments, to Niles-Bement-Pond Company, New York, N. Y., a corporation of New Jersey

Application September 17, 1935, Serial No. 40,955

2 Claims. (Cl. 33—172)

1. A setting device for boring machine work supports comprising in combination, a body member adapted for mounting upon the spindle of said machine, a single piece head on said body member adjustable in a direction normal to the axis of rotation of said spindle, an indicator having its body member detachably fixed to said head, and a centrally pivoted lever mounted for oscillation upon bearings within said head about an axis normal to the axis of said spindle, said lever at its lower end being adapted to engage a surface of the work piece being positioned and at its upper end engaging the actuating member of said indicator.

2,098,839

REFRACTORY MATERIAL

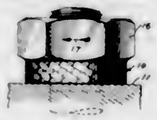
John D. Sullivan, Columbus, Ohio, assignor to The Battelle Memorial Institute, Columbus, Ohio, a corporation of Ohio

No Drawing. Application September 28, 1934, Serial No. 745,975

3 Claims. (Cl. 106—9)

1. An article of manufacture comprising magnesite grains bound together by hydrolysis of a cement formed of a ground stable clinker consisting chiefly of periclase, tricalcium silicate and calcium ferrite or aluminate, which clinker has been fired at a temperature of about 2500° F. or more for a period of time sufficient to render it stable against slaking and dusting.

2,098,840



NUT LOCK

Adolf Thode, Hamburg-Billbrook, Germany

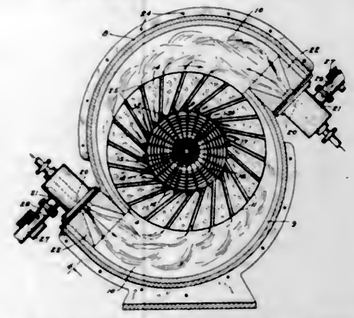
Application January 16, 1937, Serial No. 120,889

In Germany January 21, 1936

19 Claims. (Cl. 151—36)

1. A securing means comprising plural overlapping biting parts adapted for engagement with a nut or the like and a support respectively; means for yieldably holding said parts spaced

and against relative rotation and in said engagement; a means associated with said parts respectively for causing said parts to move reversely to nut-tighten direction during nut tightening.



2,098,841

STEAM GENERATOR

Hendrik N. F. Verloop, Amsterdam, Netherlands, assignor of one-third to The Heil Co., Milwaukee, Wis., a corporation of Wisconsin

Application April 10, 1937, Serial No. 136,108

11 Claims. (Cl. 122—11)

1. In a steam generator, a casing forming an annular chamber revolvable about its axis of annularity, means for conducting hot gases inwardly through said chamber, atomizing nozzles for delivering liquid outwardly within said chamber, and means for conducting steam away from said chamber inwardly toward said axis.

2,098,842

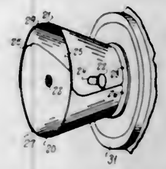
PREPARATION OF ACETALDEHYDE AND A CATALYST THEREFOR

Hans Walter, Frankfort-on-the-Main, Germany, assignor to Deutsche Gold- und Silber Scheideanstalt vormals Roessler, Frankfort-on-the-Main, Germany, a corporation of Germany

No Drawing. Application November 13, 1935, Serial No. 49,552. In Germany May 24, 1930

8 Claims. (Cl. 260—139)

7. An acidic catalyst body for the production of acetaldehyde by reacting acetylene with water which comprises activated carbon impregnated with phosphoric acid and a phosphate of at least one metal selected from the group comprising zinc, cadmium and silver.



2,098,843

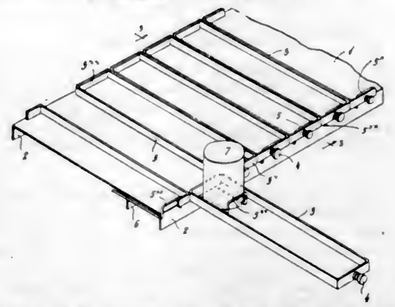
LIGHT-SHIELD FOR CAMERAS, ETC.

Charles A. Watrous, New Haven, Conn.

Application October 27, 1934, Serial No. 750,306

6 Claims. (Cl. 88—1)

1. A light-shield for installation upon the lens-mounts of cameras, comprising: two complementary flexible light-shield leaves of substantially-corresponding widths; and two pivots extending between the two said leaves respectively at spaced-apart points substantially equal to one-half the distance around the adjacent circumference of the cone to be formed; the said leaves and pivots being so constructed and arranged that the said leaves are super-imposable flatwise one upon the other when the light-shield is removed from a lens-mount and reversible from such condition into substantially-conical form for application to a lens-mount with their initially-opposite edges located at the same end of the cone.



2,098,844

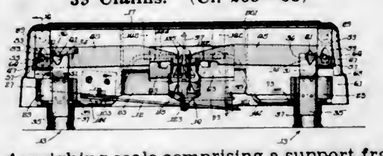
ARTICLE PROJECTION APPARATUS FOR SHELVES

William V. Waxgiser, Brooklyn, N. Y.

Application October 28, 1935, Serial No. 46,997

6 Claims. (Cl. 312—71)

1. Article projection apparatus for a shelf, comprising a plurality of frame members, each of rectangular bent formation and adapted to rest upon the top of a shelf, and each adapted to embrace a row of cans, and to move the row forwardly when the frame member is given a corresponding movement, and a plurality of slides supported by and below the shelf for horizontal sliding movement, one for each frame member, and each provided with supporting means for a can, the slides each having a portion extended into the path of the foremost cans and being movable by the latter to a predetermined extent, so as to provide a support for the foremost can in front of the shelf.

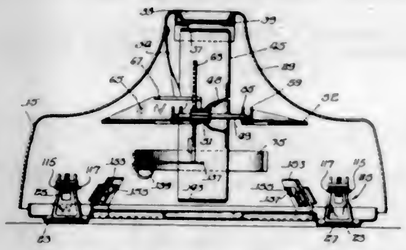


2,098,845

WEIGHING SCALE

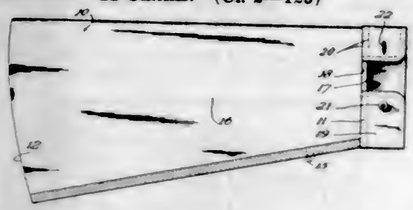
Mathias J. Weber and Russell E. Vanderhoff, Chicago, Ill., assignors to Continental Scale Corporation, Chicago, Ill., a corporation of Delaware

Application September 27, 1934, Serial No. 745,778



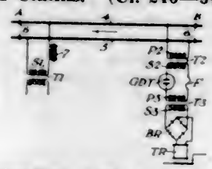
39 Claims. (Cl. 265—68)

1. A weighing scale comprising a support frame, weighing mechanism comprising a system of interconnected levers fulcrumed on said frame, and a weight receiving platform carried by said levers, resilient weighing means connecting said levers on said platform, and an indicator comprising a graduated dial element carried on said platform and a pointer element mounted on the platform in position extending above said dial, one of said



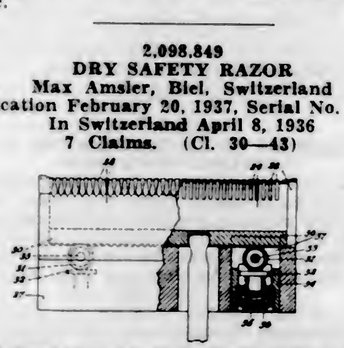
elements being turnable on said platform with respect to the other, said other being fixed on the platform and means carried by said platform and drivingly connecting said turnable element with said levers.

2,098,846
WEIGHING SCALE
Mathias J. Weber and Russell E. Vanderhoff, Chicago, Ill., assignors to Continental Scale Corporation, Chicago, Ill., a corporation of Delaware
Application May 19, 1936, Serial No. 80,520
16 Claims. (Cl. 265—68)



1. A weighing scale comprising a base, weighing mechanism comprising a system of levers fulcrumed on said base, a weight receiving platform on said levers, and a resilient weighing means on which said system of levers is yieldingly suspended, said resilient means comprising a spring connected at one end to said lever system, and adjustable means for attaching the other end to said spring on the weight receiving platform, said adjustable means comprising a pin adapted for longitudinal movement on the platform, manually operable means for adjustably moving said pin on the platform, spring means normally urging the pin in one direction on the platform, said spring means being connected on said pin to prevent rotation thereof with respect to the platform, and means securing said spring means against rotation with respect to the platform.

2,098,847
SHIRT SLEEVE
Alvin J. Wenzel, Michigan City, Ind., assignor to Reliance Manufacturing Company, Chicago, Ill., a corporation of Illinois
Application April 10, 1935, Serial No. 15,631
11 Claims. (Cl. 2—125)

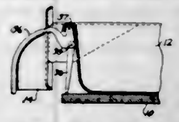


1. A shirt sleeve comprising a generally cylindrical sleeve body having at one end a shoulder edge adapted to be sewn to a shirt body and at the other end a cuff edge, and a cuff having a sleeve edge sewn to the cuff edge of the sleeve, the cuff projecting beyond the cuff edge of the sleeve and of lesser circumferential length than the cuff edge of the sleeve, leaving a gap between the ends of the cuff.

2,098,848
RAILWAY TRACK CIRCUITS
Harold G. Witmer, Pittsburgh, Pa., assignor to The Union Switch & Signal Company, Swissvale, Pa., a corporation of Pennsylvania
Application February 21, 1935, Serial No. 7,602
11 Claims. (Cl. 246—34)

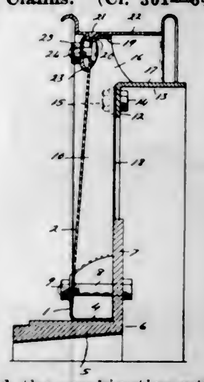
1. In combination with a section of railway track, means supplying a potential across the rails of the section at one end thereof, a track relay and a transformer at the other end of the section, a bridge across the rails of said section comprising the primary winding of said transformer, and a glow discharge tube included in circuit with the secondary winding of said transformer responsive to pass operating current through the winding of the track relay when and only when the section is unoccupied and the potential of current supplied to the secondary winding of said transformer is above a predetermined minimum value whereby said track relay will release more positively due to the interruption of the operating current when a train enters said section and the potential across said secondary winding decreases below said predetermined value.

2,098,849
DRY SAFETY RAZOR
Max Amsler, Biel, Switzerland
Application February 20, 1937, Serial No. 126,917
In Switzerland April 8, 1936
7 Claims. (Cl. 30—43)



7. A dry safety razor, comprising in combination a stationary shearing comb and a movable shearing comb accommodated within said stationary comb, annular rolling elements interposed between said stationary and movable combs and providing an anti-friction support for said movable comb, pins fixed in one of said combs, one of said pins extending with clearance through each of said annular rolling elements for limiting the rolling movement thereof in both directions.

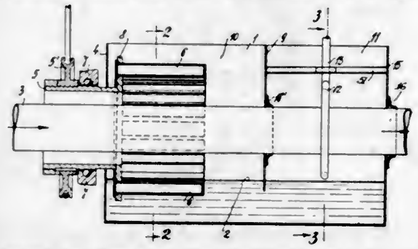
2,098,850
ICE TRAY RELEASE MECHANISM
Sven W. E. Andersson, Evansville, Ind., assignor, by mesne assignments, to Servel, Inc., Dover, Del., a corporation of Delaware
Application October 27, 1933, Serial No. 695,398
5 Claims. (Cl. 62—108.5)



4. The combination with an ice freezing receptacle, adapted to engage a refrigerated support therefor, of a toggle device on the receptacle for breaking an ice bond between the receptacle and such support; said device comprising a pair of levers hinged together and attached to the

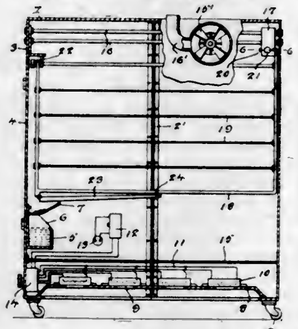
receptacle in a manner to engage said support when said receptacle is supported thereon, and means for operating said device comprising a

handle formed integrally with one of said levers for moving said levers toward a straight line position to exert a separating force between said receptacle and support.



2,098,851
VEHICLE WHEEL
Charles S. Ash, Birmingham, Mich., assignor, by mesne assignments, to The Kelsey-Hayes Wheel Company, Detroit, Mich., a corporation of Delaware
Original application January 31, 1925, Serial No. 5,998. Divided and this application June 25, 1931, Serial No. 546,881. Renewed July 19, 1933
2 Claims. (Cl. 301—64)

1. In a wheel, the combination with a hub provided with an annular flange projecting therefrom, of a wheel body provided with an axially disposed annular rib on the inner edge thereof adapted to bear against said flange, said wheel body being also provided with axially disposed perforations, the parts of the wheel body adjacent said perforations being bent over to form stiffening ribs, the inner portions of said ribs bearing against said hub flange with fastening bolts passing through said wheel body and said hub flange intermediate of the points of engagement of said wheel body ribs and said hub flange, said bolts holding said wheel body in firm engagement with said hub flange.

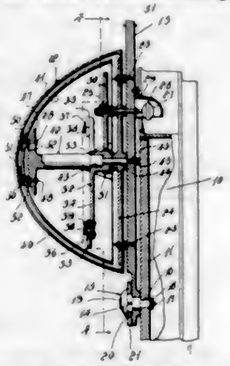


2,098,852
DEVICE FOR HARDENING STRUCTURES PRODUCED FROM HIDE SUBSTANCE
Oskar Walter Becker, Hamburg, Germany, assignor to firm Naturin Gesellschaft mit beschränkter Haftung, Weinheim-B., Germany
Application October 23, 1933, Serial No. 694,904
In Germany July 21, 1933
5 Claims. (Cl. 91—30)

1. A device for hardening artificial sausage skins produced from hide substance, comprising a container, a distillate obtained from cellulose-containing substances in the lower portion of said container, a partition subdividing said container into two chambers, passages in the walls of said container and partition for the entrance, passage and discharge of the sausage skins having the form of an endless tube, rubber packings on said passages in said partition and rear wall of the container, said packings having a cross section smaller than that of the sausage skins, a rotatable scooping device provided with scoops

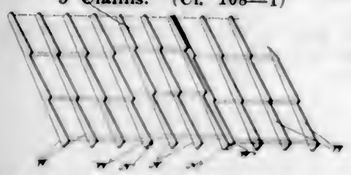
adapted to dip into the distillate and to pour it onto the sausage skins, and an annular compressed air supplying device in the second chamber of said container, the sausage skins passing through said annular device, said annular device being apertured inside to allow compressed air to flow towards the surface of the sausage skins to insure uniform distribution of the distillate.

2,098,853
CLOTHES DRIER
John A. Billingsley, Dayton, Ohio
Application March 8, 1937, Serial No. 129,743
3 Claims. (Cl. 34—40)



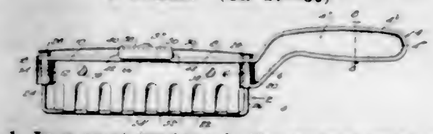
1. A drier comprising a portable cabinet having ventilation openings to permit the circulation of air therethrough and having a doorway, a door for opening and closing said doorway, heating means in said cabinet, a screen overlying the heating means, supporting rods mounted in the cabinet, blocks slidable on said rods, racks detachably secured to said blocks and movable to extend outwardly of the cabinet by way of the doorway, hooks carried by said cabinet and slidably receiving the racks.

2,098,854
AUTOMOBILE THEFT PREVENTER
William H. Blaney, Dallas, Tex.
Application September 10, 1936, Serial No. 100,202
4 Claims. (Cl. 116—61)



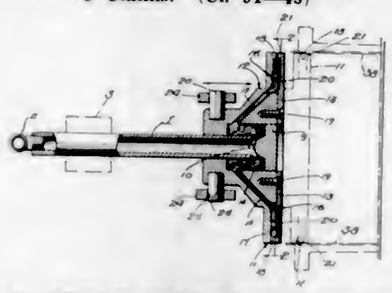
1. A device of the class described comprising a fixed support and a rotatable part surrounding the same, a lever movable in a path in parallelism to the fixed support, an audible signal carried

and supported only by the lever having a part engageable with said rotatable part through operation of the lever, a bolt securing the lever to



the fixed support, said lever being pivoted on said bolt, an arm held in fixed position by said bolt, and a contractile spring between said lever and said arm.

2,098,855
HOUSE ROOF CONSTRUCTION
Iver M. Brandjord, Helena, Mont.
Application June 11, 1935, Serial No. 25,991
5 Claims. (Cl. 108—1)

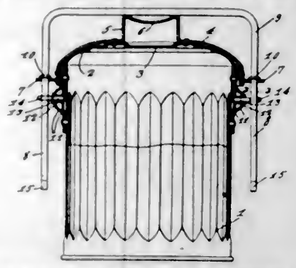


1. In a roof construction, a plurality of groups of inclined rafters, said groups being parallel and each group comprising a plurality of parallel individual rafters, each individual rafter having a series of longitudinal recesses, one end of each recess being deeper than the other and the rafters of alternate groups being of a different width than those of intermediate groups, and a series of rectangular plates disposed in the recesses of the various rafters in overlapping relation at their ends and sides, the plates of said alternate groups being in a common plane below the plates of the remaining groups.

2,098,856
MEAT TENDERER
Joseph E. Bridges, Independence, Mo.
Application May 22, 1937, Serial No. 144,275
3 Claims. (Cl. 17—30)

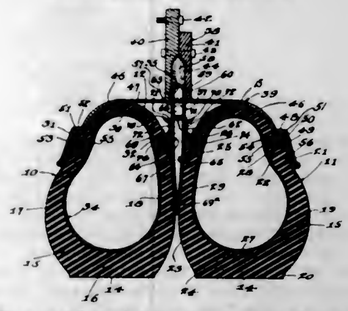
1. In a meat tender a knife carrier formed of a depending portion, a head and a pair of tubular bearings integral with the ends of said portion, said head being integral with one end of said bearings and formed with openings having their walls registering with the inner faces of the bearings, the width of the head being greater than the thickness of said portion, a horizontally disposed handle member of I-shaped contour in transverse cross section at any point throughout its length and disposed on its lower lengthwise edge, said member including a downwardly inclined forward portion having its forward end integral throughout thereof with one end of said head and one of said bearings, said head forming a flush continuation of the upper lengthwise edge of said member, the lower lengthwise edge of said member being flush with the bottom of the said bearing, and said carrier including a pair of outer lugs and an inner lug, said lugs being arranged in spaced relation, said lugs being integral with the upper face of said head, the pair of outer lugs being of less height than the inner lug, the latter being formed with a threaded socket and disposed at the transverse median of the head.

2,098,857
ADHESIVE APPLYING MECHANISM
Harold Scott Buckingham, Bala-Cynwyd, Pa., assignor to Silver Seal Dairy Products Company, Philadelphia, Pa., a corporation of Delaware
Application November 4, 1936, Serial No. 109,192
8 Claims. (Cl. 91—43)



1. An adhesive applying device comprising a reciprocating distributing head having a chamber therein and discharge ports communicating therewith, a relatively fixed feeding tube extending through said head for supplying adhesive to the chamber thereof, and an enlarged piston-like extremity on said tube slidably occupying said chamber, said piston-like extremity being operative in one stroke of each cycle of reciprocation of said head to exert pressure on the adhesive in the chamber and discharge the same outwardly through said discharge ports and in the other stroke to create suction in said chamber tending to withdraw adhesive from the neighborhood or area of said discharge ports.

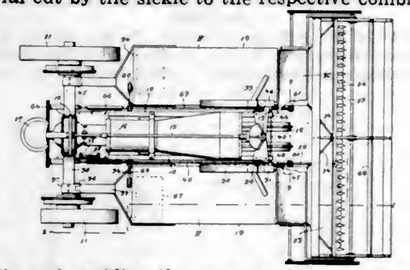
2,098,858
RECEPTACLE
James W. Busson and George C. Thompson, Los Angeles, Calif.
Application September 4, 1936, Serial No. 99,479
3 Claims. (Cl. 220—38)



1. A receptacle comprising a body, a cover therefor, a handle for the cover and having a downwardly curved bight portion, means extending from the handle and upon diametrically opposite sides of the cover, with the diametrically extending portions having openings therein, eyed members swivelly mounted to the body upon diametrically opposite sides thereof, a handle for the body normally resting on the bight portion when the cover is in closed position and including arms slidably mounted through the eyed members, stops on the free ends of the arms to limit the

movement thereof with respect to the eyed members, said arms being mounted for slidable movement in the openings of the extending means to

carry the cover for movement thereon to opened and closed positions, and means on the arms to limit the movement of the cover with respect thereto.

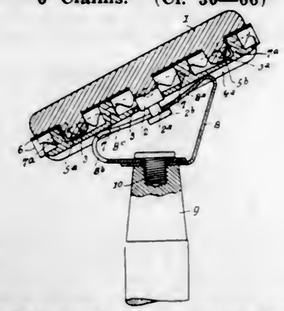


2,098,859
COMBINED FELLY, RIM, AND DUAL PNEUMATIC TIRE STRUCTURE
Placid N. Chiasson, Griggsville, Ill.
Application February 8, 1937, Serial No. 124,770
12 Claims. (Cl. 152—13)

1. In a combined felly rim and dual tire structure, a pair of inner sidewise aligned pneumatic tires including outer shoes and cap members for closing the shoes, carrying means for the tires, and a floating slidable, annular, combined confining, separating and abutment element for and interposed between said tires.

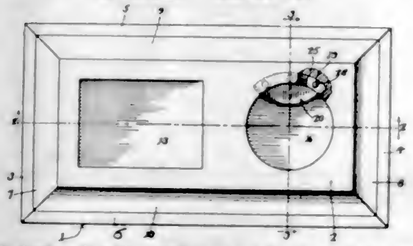
2,098,860
HARVESTER ATTACHMENT FOR TRACTORS
Everette Creech, Camden, Ohio
Application January 16, 1937, Serial No. 120,995
5 Claims. (Cl. 56—21)

5. A harvester attachment for tractors having a body frame provided with front and rear wheels and a power unit upon said frame, comprising combine units arranged at opposite sides of said frame forwardly of the rear wheels, means connecting the units with the tractor for vertical movement, a sickle forwardly of the units and carried thereby, means above the sickle for directing material cut thereby rearwardly in the direction of the said units, means on the tractor and operative upon the units for the raising and lowering of the same together, means operated by the power unit of the tractor for actuating the said combine units and the sickle, a platform between the sickle and the forward ends of said combine units for receiving material cut by the sickle, and a divider between the units at their forward ends on the platform for directing material cut by the sickle to the respective combine



units and avoiding the passage of such cut material onto the tractor.

2,098,861
NITROGEN CONTAINING ORGANIC COMPOUNDS
Miles A. Dahlen, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application May 1, 1935, Serial No. 19,145
6 Claims. (Cl. 260—54)



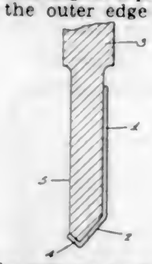
1. A process for producing heterocyclic compounds of the furane series which comprises reacting in the presence of an acid-binding substance a member of the group consisting of furfuryl and hydrofurfuryl amines with a saturated aliphatic acid of 2–4 carbon atoms having one hydrogen attached to carbon replaced by halogen.

2,098,862
SAFETY RAZOR WITH RESILIENT DETACHABLE SUPPORT
Fritz Ebert and Erich Ebert, Koln-Vingst, Germany
Application August 17, 1936, Serial No. 96,450
In Germany March 13, 1935
6 Claims. (Cl. 30—66)

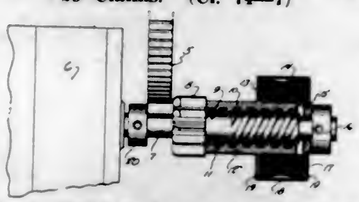
1. A safety razor, comprising in combination a cover plate provided with a centre pin and two side pins on its under side, a guard plate having apertures registering with and adapted to accommodate said pins, a razor blade with three holes adapted to be clamped between said plates, a neck formed on said centre pin, a flange formed on the end of said neck, a resilient support, a concave top arm of said support adapted to bear at its two ends against the under side of said guard plate and having a slot adapted to accommodate said centre pin, the flange at the end of said centre pin bearing against the side of said resilient arm, and a handle carrying said support and adapted to shift the same relatively to said plates to clamp said blade therebetween.

2,098,863
COMBINED CUTTER AND ADVERTISING DEVICE
Richard D. Elliott, Ahoskie, N. C., assignor of one-third to J. Bailey Barnes, Ahoskie, N. C.
Application November 13, 1935, Serial No. 49,601
1 Claim. (Cl. 30—2)

A device for the purpose set forth, a base section, a top section superimposed upon and fixedly secured to the base section, said top section being formed with a vertically disposed opening, the wall of said opening coacting with a part of the upper face of the base section to provide a vertically disposed recess opening at its upper end, the lower portion of the wall of said opening being formed with a rabbet for a part of its length, said rabbet coacting with another part of the upper face of the base section to provide a socket opening into said recess at the bottom of the latter, a cutter mounted in and extended from said socket into said recess, superposed strips within and for spacing the cutter from the top and bottom walls of said socket, and spaced means carried by and extending upwardly from the base section, passing through said cutter and engaging with said strips for anchoring the cutter to said base section.



2,098,864
SPUR GEAR
Albert Forster, Milanino, Italy
Application February 24, 1934, Serial No. 712,809
Renewed April 1, 1937. In Switzerland October 2, 1933
21 Claims. (Cl. 74—466)

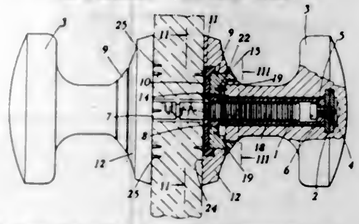


1. In a spur toothed wheel having a centre plane, teeth being asymmetrical with regard to said centre plane and a track on each of said teeth being, when developed in a plane, an uneven line; another, similarly shaped track on each of said teeth, being inverted with regard to said first mentioned track.

2,098,865
ROTARY FILE
Samuel T. Freas, Trenton, N. J., assignor to Henry Disston & Sons, Incorporated, Tacony, Pa., a corporation of Pennsylvania
Application February 12, 1937, Serial No. 125,510
2 Claims. (Cl. 29—78)

1. A rotary file for sharpening beet knives and the like, said file comprising a circular disk blade having in the peripheral portion thereof a radially disposed filing surface, a beveled filing surface adjoining the outer edge of said radial surface and extending at a predetermined angle to the latter, the outer edge of said bevel surface forming the extreme periphery of the blade, and a reversely beveled filing surface extending from said extreme periphery.

2,098,866
ENGINE STARTER
John W. Fitz Gerald, Milwaukee, Wis., assignor to Briggs & Stratton Corporation, Milwaukee, Wis., a corporation of Delaware
Application May 24, 1937, Serial No. 144,347
25 Claims. (Cl. 74—7)

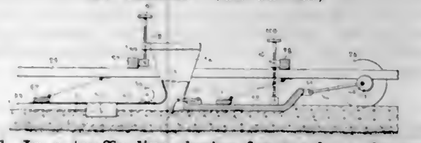


1. In an engine starter: a motor driven shaft; a pinion and a driving connection between the pinion and the shaft by which the pinion is propelled forwardly upon initial rotation of the shaft and rotation is transmitted from the shaft to the pinion, said driving connection including two cooperating spaced members, one of which is fixed to the shaft and the other having a threaded connection with the pinion, but said members having no connection with each other; and an elastically compressible block disposed between said members and arranged to impart an endwise and torsionally yieldable driving connection between said members entirely through frictional engagement of said members with the opposite ends of said elastically compressible block.

2,098,867
DEVICE FOR OVERCOMING STUTTERING
William Baxter Gilsson, Trenton, Tenn.
Application April 16, 1936, Serial No. 74,723
3 Claims. (Cl. 128—137)

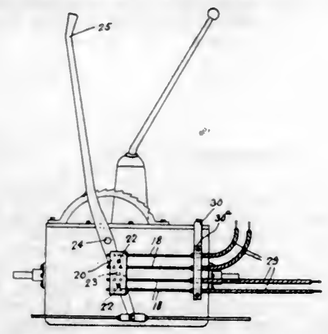
1. A device of the character described, comprising a relatively long body of heavy material formed to position in the mouth beneath the tongue and having a forward end adapted to position against the back of the lower front teeth and having a back wall formed to press against the frenum of the tongue, and arm members each extending laterally from the body at the rear thereof and each including an attaching portion which enters the rear face of the body at one side of the frenum, the arms adjacent their outer ends being adapted to position upon the lower teeth of the jaw.

2,098,868
DOOR HANDLE AND LIKE FASTENING
Robert Grimmond, Voorburg, The Hague, Netherlands
Application April 19, 1937, Serial No. 137,874
In Great Britain April 22, 1936
18 Claims. (Cl. 292—353)



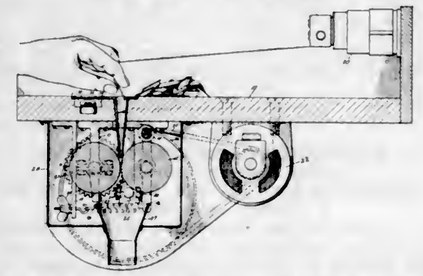
1. A door handle assembly comprising, in combination, a spindle, a recess in the spindle, a socket turnable with the spindle and having at least one apertured side, a handle turnable with the socket, a carrier member turnable on the socket relative to the handle, and spring retaining means anchored to the carrier member and disposed to pass through said apertured side into engagement with said recess under a partial relative turning of the handle and the carrier member and to move out of engagement with said recess and ride on said socket under another partial relative turning of the handle and the carrier member.

2,098,869
ARTIFICIAL RESINS AND METHOD OF MAKING
Jesse Harmon and Frederick M. Meigs, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application June 17, 1936, Serial No. 85,820. In Switzerland June 20, 1935
8 Claims. (Cl. 260—4)



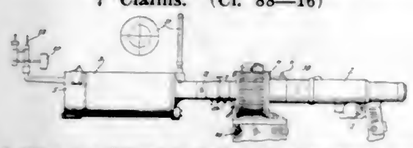
1. Process which comprises adding to a solution of 94 parts of phenol in 50 parts of water over a period of one hour, a solution of 31 parts of methylamine in 162 parts of aqueous 37% formaldehyde, maintaining the temperature of the reaction mixture below 10° C. during the addition, thereafter allowing the temperature of the reaction mixture to rise to 40° C., maintaining the reaction mixture at that temperature until the exothermic reaction is complete, heating at 100° C. until the resinous mass thickens, grinding the cooled brittle resin with water to a slurry, filtering, washing and drying.

2,098,870
ROAD JOINT MACHINE
John N. Heltzel, Warren, Ohio
Application March 12, 1934, Serial No. 715,243
15 Claims. (Cl. 94—45)



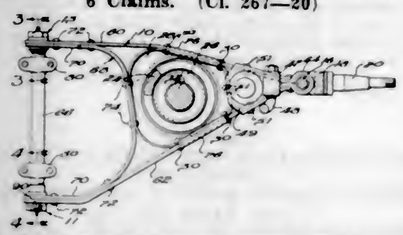
1. In a traffic line device for roads, a depression forming member, a traffic line former behind said depression former, means between the two formers for holding a quantity of traffic line material to be delivered into the depression and molded by said traffic line former, and means acting behind the depression former for roughening the bottom surface of the groove.

2,098,871
AUTOMOBILE DOOR LOCK OPERATING MEANS
James Paris Jones, East St. Louis, Ill.
Application August 24, 1935, Serial No. 37,729
1 Claim. (Cl. 74—501)



In combination, a brake lever, a support for the brake lever, a clamp block rockably connected to the lower portion of the said lever, said block being divided into a pair of sections, a bracket secured to the said support, a clamp plate secured to the bracket, a plurality of elongated flexible conduits having one end clamped between the clamp plate and the bracket, control wires extending through the conduits and engaged between the sections of the said clamp block, and means for holding the sections of the block in clamping relation with the said wires, one of said sections of the clamp block being provided with a trunnion disposed through an opening in the brake lever, and means on the trunnion preventing return of the trunnion through the said opening.

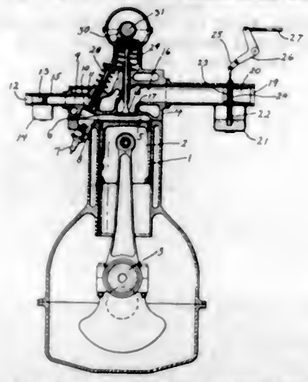
2,098,872
ELECTRICALLY CONTROLLED COUNTING MECHANISM
Philip G. Krippner, Rudolf J. Heins, and Arnold G. Bur, Green Bay, Wis.
Application October 16, 1933, Serial No. 693,846
3 Claims. (Cl. 235—98)



3. In a machine for counting flat articles, a counter, a pair of horizontally exposed rolls lying side by side in opposing relation, a funnel shaped article feeder disposed above said rolls and lying in the plane of the rolls, said feeder having a restricted orifice adapted to feed articles singly and successively between the rolls, said rolls being yieldingly mounted with respect to each other so as to permit the passage of articles between the rolls, and means for actuating the counter upon the passage of articles between the rolls.

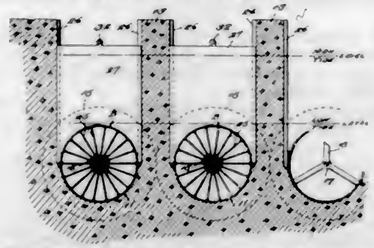
2,098,873
TARGET PRACTICING DEVICE
Heinz Küppenbender, Wilhelm Winzenburg, Rudolf Felgner, Oscar Fischer, and Kurt Kaden, Dresden, Germany, assignors to Zeiss Ikon Aktiengesellschaft, Dresden, Germany
Application August 20, 1936, Serial No. 96,912
In Germany August 3, 1935
7 Claims. (Cl. 88—16)

1. In a machine gun camera, a camera proper which has a main operating shaft and a stock with trigger mechanism and having an opening, a readily detachable spring-motor-unit, means detachably securing said unit, as such, in place in co-operative position with relation to said opening in said stock, said unit and said main operating shaft each having engaging power-transmitting elements designed to be brought into operative relation with one another by placement of said unit in position on the stock, and means actuated by said trigger mechanism for controlling the operation of said spring-motor.



2,098,874
INDIVIDUAL SUSPENSION
John W. Leighton, Port Huron, Mich.
Application November 25, 1935, Serial No. 51,396
6 Claims. (Cl. 267—20)

1. As an article of manufacture, a wishbone for forming a suspension between a vehicle frame and a vehicle wheel comprising divergent leg members and a stiffening strut connecting said leg members at their divergent ends, said legs and strut members being formed of metal stampings.

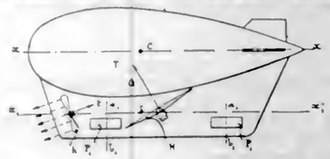


2,098,875
INTERNAL COMBUSTION ENGINE
Marion Mallory, Detroit, Mich.
Application May 29, 1936, Serial No. 82,588
6 Claims. (Cl. 123—75)

1. In an internal combustion engine, a cylinder, a primary combustion chamber having a spark gap located in its lower extremity, a small carburetor communicating with the primary combustion chamber, a secondary combustion chamber with a carburetor connected thereto, said primary combustion chamber and secondary combustion chamber being in constant communication with each other by a port having a higher restriction than the passageway through the small carburetor which communicates with the primary combustion chamber, said small carburetor including means for supplying the primary combustion chamber with a fixed combustible charge that varies only with engine speed, the other carburetor including means for supplying the secondary combustion chamber with a charge of air that varies in volume only with engine speed, means for admitting fuel to the

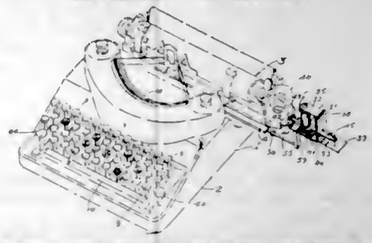
charge of air in proportion to power demand, and valve means for admitting the charge to the primary combustion chamber and secondary combustion chamber simultaneously.

2,098,876
HYDRAULIC POWER PLANT
John M. Nash, Lakeland, Fla.
Application January 3, 1936, Serial No. 57,421
1 Claim. (Cl. 61—20)



A plant of the character described comprising a vertical wall disposed crosswise of a water-way and having a plurality of spaced vertical straight water courses therein extending throughout the entire thickness of the wall, a series of alternately arranged stationary and rotary cylinders located within said water courses at the bottoms thereof, shafts disposed centrally of said cylinders, water wheels fixed to said shafts within said rotary cylinders and including a hub and blades directed radially from the hub and angularly disposed, directing blades fixed within said stationary cylinders and radially extending from said shafts and disposed at reverse angles to said first mentioned blades, and gate means disposed within the water courses for regulating water flow through said cylinders and the water course above such cylinders.

2,098,877
STABILIZING DEVICE FOR AERIAL NAVIGATION MACHINES
Etienne Edmond Oehmichen, Valentigney, France
Application October 28, 1935, Serial No. 47,173
In France October 31, 1934
4 Claims. (Cl. 244—4)



1. In an aircraft of the helicopter type, an air-filled cell having its volumetric center midway its depth at the center of its longitudinal

axis, the center of gravity of the aircraft being spaced downwardly from the said volumetric center, and a lifting screw device located downwardly from the center of gravity whereby for

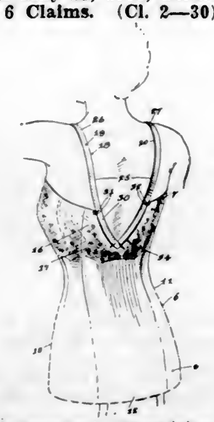
each horizontal displacement the resistance opposed to such displacement by the ambient air is applied at a point situated close to the center of gravity and below the center of volume of the aircraft.

2,098,878
VARIABLE SPACING MECHANISM FOR TYPEWRITING MACHINES
Charles Clinton Peters, State College, Pa.
Application September 16, 1936, Serial No. 101,156
11 Claims. (Cl. 197—84)

10. In a typewriting machine having a movable carriage and an escapement, a rack bar controlled by said escapement, means connecting said carriage to said rack bar for movement therewith including an auxiliary escapement and mechanism operable to momentarily release said auxiliary escapement and disconnect the carriage from the rack bar to permit movement of the former independently of the latter and the escapement.

2,098,879
ALLOY FOR DENTAL PLATES
Alan Richard Powell, London, England, assignor to Johnson, Matthey & Company, Limited, Hatton Garden, London County, England, a British company
No Drawing. Application January 12, 1937, Serial No. 120,289. In Great Britain February 28, 1936
7 Claims. (75—173)

1. An alloy for dental plates consisting of from 20 to 40% of palladium, from 35 to 65% of silver, from 15 to 30% of copper and from 0.05 to 0.25% of phosphorus, the amounts of silver and copper being present in percentages within 5% above or below the eutectic ratio.

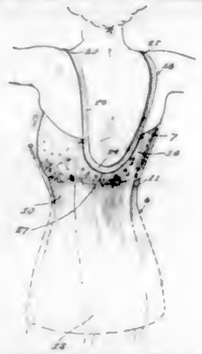


2,098,880
SLED
Lawrence E. Reed, York, Nebr.
Application August 18, 1936, Serial No. 96,669
6 Claims. (Cl. 280—22)

1. In a sled of the class described, a body, flexible runners, front and rear cross bars pivotally connected to said runners, said front bar being fixed to said body, a tie plate secured to said body, said tie plate having a longitudinal slot, an anchoring bolt passing through said slot and rear bar for connecting said body to said rear bar and

permitting longitudinal shift of the rear bar with respect to said body, and means for flexing said runners.

2,098,881
UNDER-GARMENT
Philip H. Robbins, New York, N. Y., assignor to Poirette Corsets, Inc., New York, N. Y.
Application May 28, 1936, Serial No. 82,351
6 Claims. (Cl. 2—30)



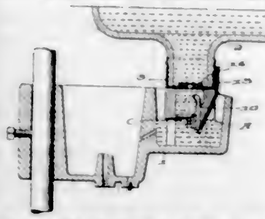
1. An undergarment comprising a body part formed of a front, a back and a pair of sides, said back being formed with a V-shaped notch opening at and adjacent the ends of its top edge, an elastic element formed of a pair of oppositely extending resilient strap-like members having corresponding end terminal portions overlapping and secured together to provide said member with a V-shaped rear stretch, a pair of spaced intermediate stretches forming shoulder suspensions and forward continuations of the sides of said rear stretch and a pair of spaced front stretches forming depending continuations of said intermediate stretches, the lower portion of said rear stretch being positioned in said notch, means for connecting the outer edge of said lower portion with the edge of said notch, means for securing the ends of the lower portion of said rear stretch to said back and means for securing the lower ends of said front stretches to the top of the front of said body part.

2,098,882
UNDER-GARMENT
Philip H. Robbins, New York, N. Y., assignor to Poirette Corsets, Inc., New York, N. Y.
Application May 28, 1936, Serial No. 82,352
4 Claims. (Cl. 2—30)

1. A woman's undergarment comprising a body formed of brassière and a girdle, the front of the brassière being formed at its upper portion with a pair of tapered parts having their apices spaced adjacent to opposed sides of the lengthwise median of the front of said body, the back of the brassière being formed in its top edge with

a cutout providing a notch having its mouth spaced from the ends of said edge, an elastic element of strap-like form including an upstanding U-shaped rear stretch, a pair of intermediate stretches forming shoulder extensions and forward continuations of the sides of the rear stretch and a pair of front stretches forming depending

continuations of the intermediate stretches, the lower portion of said rear stretch extending into said notch, means for connecting the bottom edge of said lower portion of the rear stretch with the edge of said notch, and means for securing the lower end terminal portions of the front stretches to the apices of said tapered parts.



2,098,883

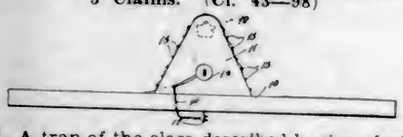
SYNCHRONIZED OIL LEVEL CONTROL

James A. Rook and Clay H. Rook, East Palestine, Ohio

Application May 15, 1934, Serial No. 725,814

6 Claims. (Cl. 137—68)

1. In a constant liquid level control device, a casing, the botom wall of the casing having two openings therethrough the entrances to which are in the same plane, and a valve closure for said openings, said closure having a U-shaped stem one end of which is secured to the bottom wall of the casing and the other end loosely mounted in said closure, said closure and said stem being within the casing.



2,098,884

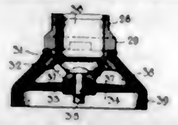
ELECTRIC RAT TRAP

Elbert B. Rousseau, Nashville, Tenn.

Application October 15, 1936, Serial No. 105,791

3 Claims. (Cl. 43—98)

1. A trap of the class described having electric circuit means including electrodes to be bridged by a rodent, one of said electrodes being a screen, over which the rodent is adapted to pass, means for maintaining said screen in a moist condition, comprising a receptacle, and absorbent means in the receptacle in contact with the screen.



2,098,885

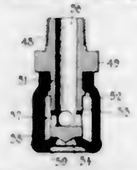
EXHAUST PORT PROTECTOR FOR AIR BRAKES

Lewis A. Safford, Watertown, N. Y., assignor to The New York Air Brake Company, a corporation of New Jersey

Application November 13, 1935, Serial No. 49,626

14 Claims. (Cl. 303—1)

1. A protector for the exhaust ports of air brakes, comprising in combination, two coacting members forming a normally closed, outwardly opening annular valve, one of said members encircling the other, both said members being of resilient deformable material, and so shaped as to be deformed when subject to internal pressure.



2,098,886

EXHAUST PORT PROTECTOR FOR AIR BRAKES

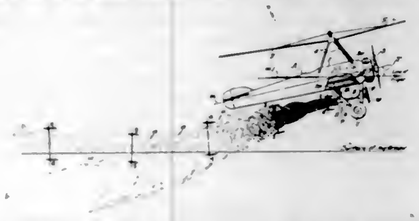
Lewis A. Safford, Watertown, N. Y., assignor to The New York Air Brake Company, a corporation of New Jersey

Original application November 13, 1935, Serial No. 49,626. Divided and this application October 20, 1936, Serial No. 106,678

3 Claims. (Cl. 303—1)

1. A protector for the exhaust ports of air brakes, comprising in combination, a central valve seat, and a coacting hollow valve member, subject internally, at least when the valve is closed, to the pressure of discharging pressure fluid, and having an inwardly extending flange which normally enters into engagement with said valve seat to effect closure of the valve, said valve member inclusive of said flange, being of resilient deformable material.

2,098,887



METHOD OF DISTRIBUTING MATERIAL

Henry Y. Satterlee, Morristown, N. J., assignor to Swan-Finch Oil Corporation, New York, N. Y., a corporation of New York

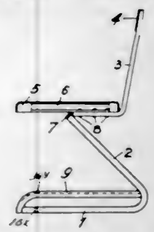
Application June 19, 1937, Serial No. 149,047

6 Claims. (Cl. 244—136)

1. In the art of distributing material from a supply thereof transported by a flying autogiro, the method which comprises passing material from such supply into the slip stream produced by the traction propeller of the autogiro, and utilizing the rotor of said autogiro to produce a pulsating down-draft on the slip stream and the material suspended therein, said rotor serving to flatten the slip stream and said propeller and rotor serving to modify the slip stream containing the suspended material so that such material

diverges from the direction of the autogiro line of flight at the time said material was fed into the slip stream.

2,098,888



CHAIR CAPABLE OF BEING PILED UP IN A VERTICAL DIRECTION

Friedrich August Schädler, Arbon, Switzerland

Application March 26, 1936, Serial No. 70,985

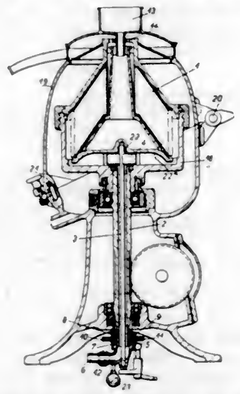
In Switzerland March 27, 1935

17 Claims. (Cl. 155—2)

7. A chair capable of being piled in a vertical direction comprising legs, a seat and a back, the back being inclined rearwardly to such an extent and the legs inclined laterally outwards to such an extent that the chair can be piled up vertically with others whereby the uppermost chair can be removed upwardly and forwardly from the pile, foot bars and supporting rails secured to said legs, a transverse member between the forward ends of said foot bars, said transverse member being located beneath the front edge of the seat.

2,098,889

SEPARATOR WITH DISCHARGE OF THE CENTRIFUGED SUBSTANCE THROUGH A HOLLOW SPINDLE



Carl Schmitz, Oelde, Germany

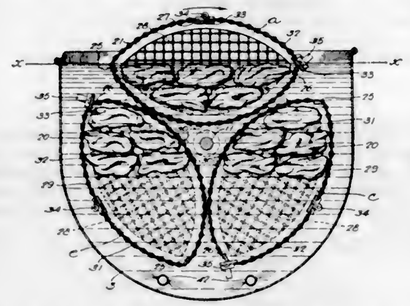
Application April 7, 1934, Serial No. 719,543

In Germany October 25, 1933

1 Claim. (Cl. 233—46)

In a centrifugal separator of the type adapted to continuously discharge two separated components of a liquid mixture to be separated, a drum disposed for rotation about a vertical axis and having a bottom provided with a substantially flat horizontally disposed inner surface and an axial aperture, means for rotating the drum including a hollow spindle secured to the bottom of the drum within said aperture, an inverted dish-shaped partition plate superposed on said inner bottom surface of the drum and substantially co-extensive therewith and dividing the drum into an upper separating space and a lower air-tight liquid receiving chamber communicating with said hollow spindle, channels extending between the heavy component zone of said separating space and said receiving chamber, a stripper axially fixed in said receiving chamber for withdrawing the heavy component from said chamber and operative to deflect said component into said hollow spindle, channels leading from

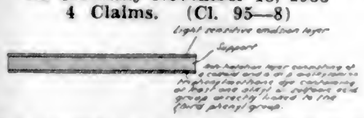
the separating space for the discharge of the light component and means for regulating the quantity of the light component discharged comprising a conduit secured to the discharge end of said hollow spindle and provided with a regulating valve.



2,098,890

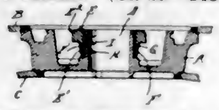
DYEING MACHINE

Joseph Schmitz, Jr., Philadelphia, Pa.



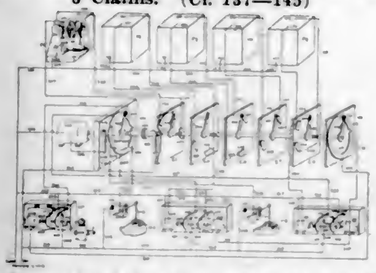
Application February 17, 1934, Serial No. 711,771

2 Claims. (Cl. 8—19)



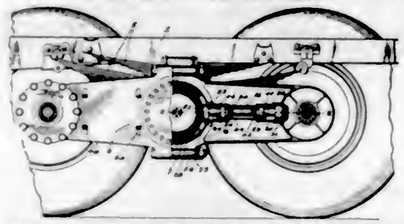
1. In a rotary dyeing machine, a drum comprising a plurality of substantially elliptical containers for respectively receiving material to be dyed, said containers being arranged in fixed relation to each other and to and about the axis of the drum with the shorter dimensions of their elliptical cross sections disposed respectively in planes radiating from the axis of the drum in substantially equiangular spaced relation to each other, and the outer semi-elliptical walls of said containers disposed in circular planes forming segments of a circle having its center coincident with the axis of the drum, and the inner semi-elliptical walls of the containers disposed in single continuous circular planes in arcs struck from centers outside the periphery of the drum with said inner walls substantially tangentially arranged one to the other adjacent the axis of the drum.

2,098,891
PHOTOGRAPHIC MATERIAL
Wilhelm Schneider, Dessau in Anhalt, and Gustav Wilmanns, Wolfen Kreis Bitterfeld, Germany, assignors to Agfa Ansco Corporation, Binghamton, N. Y., a corporation of New York
Application November 16, 1934, Serial No. 753,390
In Germany November 18, 1933
4 Claims. (Cl. 95—8)



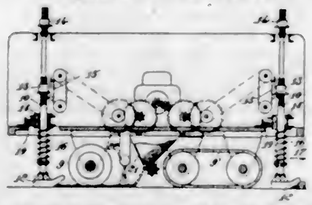
1. A photographic material comprising attached to each other a support, a light-sensitive emulsion layer and a layer comprising a colloid and a di-p-dialkylaminotriphenylmethane dye containing at least one alkyl-ω-sulfonic acid group directly linked to the third phenyl group.

2,098,892
TAP BUSH AND METHOD OF FORMING THE SAME
Claude Sintz, Detroit, Mich.
Application October 16, 1933, Serial No. 693,843
6 Claims. (Cl. 29—148.2)



4. The method of forming tap bushes which consists in separately forging the body portion of the bush and a switch therefor, said body portion being provided with a central tubular stem and said switch being integral with a sleeve for surrounding said stem having internal longitudinally extending serrations, extruding said tubular stem to form outwardly extending teeth for engaging and fitting said serrations, and pressing said switch upon said body portion.

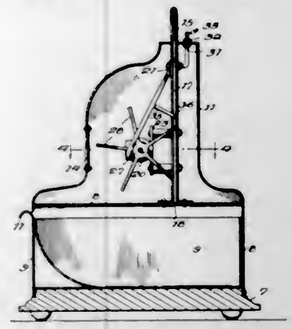
2,098,893
AUTOMATIC MULTIPLE VALVE CONTROL
Eugene Staegemann, deceased, late of Allendale, N. J., by Jessie L. Staegemann, administratrix, Allendale, N. J., assignor to The Permutit Company, New York, N. Y., a corporation of Delaware
Application September 3, 1936, Serial No. 99,324
8 Claims. (Cl. 137—145)



1. A coordinated valve operation and automatic control system comprising a plurality of conduit valves, individual fluid pressure devices for operating said valves, individual pilot valves actuating said fluid pressure devices, individual electrical motor means for operating each of said pilot valves, electrical circuits for energizing said motors, individual circuit making and breaking switch means for each of said motor circuits, actuating means for each of said switches arranged on a shaft, a master control motor for rotating said shaft and switch actuating means to make and break said electrical circuits, a circuit making and breaking control rotor on said shaft with electrical circuit connections for energizing and deenergizing said master control motor to rotate said shaft and switch means in electrical series with said master control rotor for starting said master control motor.

2,098,894
REAR WHEEL SUPPORT FOR A MOTOR VEHICLE
Hubertus Josephus van Doorne, Deurne, and Pieter Herman van der Trappen, Breda, Netherlands
Application September 26, 1935, Serial No. 42,360
In the Netherlands September 29, 1934
5 Claims. (Cl. 180—22)

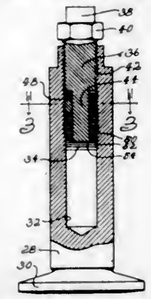
1. Means for transforming a motor vehicle having a conventional axle housing and having a driven wheeled axle journaled therein into a motor tractor having a plurality of driven road wheels at each side of the vehicle, comprising preformed carrier means having a portion adapted to be fixedly secured to the ends of the axle housing when the axle wheels are removed; said carrier means having bearing surfaces coaxial with said housing; reinforcing means connecting said portion and surfaces; rocking members journaled on the bearing surfaces; road wheels carried by the respective rocking members adjacent their ends; driving members adapted to be mounted on the ends of the axle; and means for driving the road wheels from the driving members.



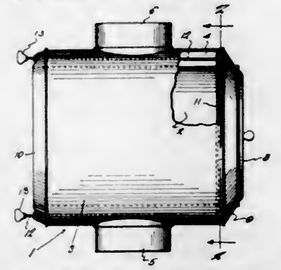
2,098,895
TAMPING MACHINE
Wilhelm Lothar Velten, Neustadt a. d. Haardt, Germany
Application April 4, 1935, Serial No. 14,674
In Germany June 14, 1934
3 Claims. (Cl. 94—49)

1. A machine for compressing the ground and building tracks of all kinds comprising in combination, a self-propelled vehicle frame mounted on wheels, a transverse row of rams carried by the frame and extending beyond the wheel track, each ram including a ram-rod, a runner-like

shoe on the lower end of said ram-rod and means for timing the operation of the individual ram-rods in said row including an abutment vertically adjustable on each ram-rod, a chain drive in proximity to said abutment, an adjustable catch on said chain cooperating with said abutment to periodically lift said ram-rod to a height determined by the adjustment of said abutment, a guide on the frame for vertically guiding said ram-rod and a spring on said ram-rod bearing against said guide, said spring adapted to be compressed during the upward movement of said ram-rod and effect the downward movement thereof.



2,098,896
SALES TAX REGISTER
Charles H. Whitacre, Morgantown, W. Va.
Application July 1, 1935, Serial No. 29,358
1 Claim. (Cl. 235—100)

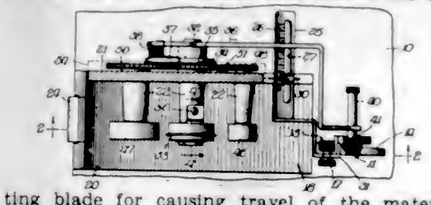


A register including a housing provided with a coin chute, a wheel rotatably mounted in the housing, the wheel including spokes the free terminals of which project into the coin chute, a bar one end of which issues into a resilient plate attached to the chute, the opposite end being in yieldable engagement with said wheel to normally secure the latter from movement, a member on the bar extending into the chute to be engaged by a coin passing through said chute to release the bar from engagement with said wheel, and means driven by the wheel to register when the wheel moves under the weight of the coin.

2,098,897
VALVE TAPPET
Henry Halld Zeder, Detroit, Mich., assignor, by mesne assignments, to Eaton Manufacturing Company, Detroit, Mich., a corporation of Ohio
Application September 11, 1935, Serial No. 40,009
5 Claims. (Cl. 123—90)

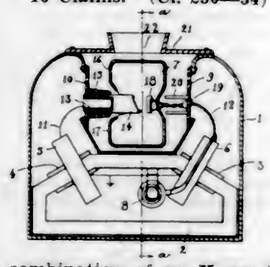
1. A valve tappet comprising a main body part having a valve engaging portion at one end and including a reduced opposite end portion of out-of-round cross section and an intermediate externally threaded cylindrical portion having a continuous and uninterrupted annular shoulder adjacent said reduced end portion, the threads of said intermediate portion extending to and completely throughout the periphery of said shoulder, an externally threaded locking member having a central out-of-round passage corresponding in cross section with the cross section of said reduced end portion and slidably mounted on the latter, said locking member having a continuous extremity adjacent said shoulder of said body part and the threads thereof being circumferentially continuous adjacent said extremity, an abutment on the end of said reduced end portion remote from said shoulder, and a compression spring bearing between said abutment and said locking member for urging said extremity thereof toward said shoulder, the leading and trailing end portions of the threads on said intermediate portion and locking member respectively being non-complementary and out of registration with each other when said shoulder and said extremity of said locking member are engaged together.

2,098,898
FLUE OVEN CLEANER
Frank J. Ayers, Piedmont, S. C.
Application December 14, 1936, Serial No. 115,857
1 Claim. (Cl. 126—17)



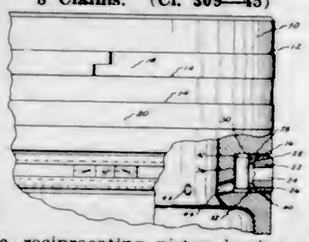
In a flue oven of the type including spaced inner and outer cylinders providing an annular chamber, end walls closing the space between said cylinders at the ends thereof, one of said end walls having openings in diametrically opposite portions thereof, bearings fixed on said one end wall in alignment with the openings, a substantially flat metallic ring mounted for reciprocation in the annular chamber and adapted to remove accumulations from the walls thereof, rods fixed on diametrically opposite portions of said ring and projecting at right angles therefrom, said rods extending slidably through the bearings, and operating knobs fixed on the outer ends of the rods.

2,098,899
OPERATING SEAM CUTTER
Sarah M. Crewdson, Chicago, Ill., assignor of one-third to Robert H. Goodhart, Chicago, Ill.
Application September 12, 1934, Serial No. 743,642
Renewed April 5, 1937
7 Claims. (Cl. 112—124)



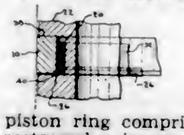
1. An attachment for sewing machines comprising a frame member rotatably mounting a cutting blade, means operatively connecting said blade with a movable element of the sewing machine whereby said blade is rotated by the action of the machine, rollers journalled by the

frame member, and means for rotating said rollers at a speed to conform with that of the cut-



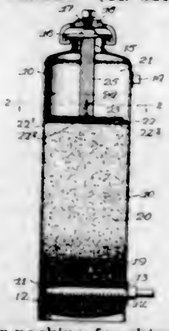
ting blade for causing travel of the material with respect thereto.

2,098,900
X-RAY APPARATUS
Samuel Hirsch, New York, N. Y.
Application January 12, 1933, Serial No. 651,316
10 Claims. (Cl. 250—34)



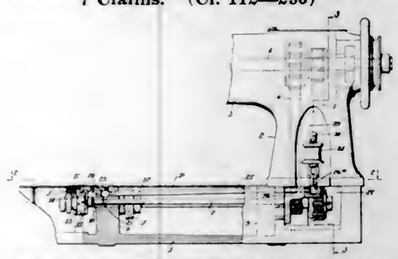
1. The combination of an X-ray tube and a transformer housing provided with an outwardly extending hollow portion, a high tension transformer located in said housing and insulated connections from it to the electrodes of the said X-ray tube, insulating and cooling material filling said housing and said extending hollow portion, said X-ray tube being outside of said housing and provided with an electrode having a metal-to-glass joint hollowed out beyond the said metal-to-glass joint of said electrode and fitting over the said hollow extending portion for the purpose of cooling the said metal-to-glass joint and the said electrode.

2,098,901
PISTON RING
Fredrick A. Luthy, Jackson, Mich.
Application May 14, 1936, Serial No. 79,692
8 Claims. (Cl. 309—45)



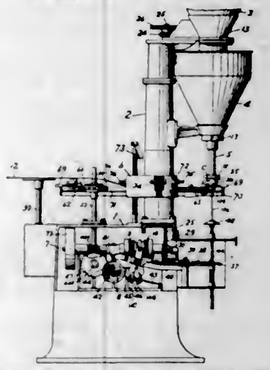
1. In a reciprocating piston having a ported ring groove, an oil ring for said piston comprising a split outer ring section located in said groove adapted to be radially expanded therein, said outer ring section having ports centrally disposed and circumferentially spaced therein, a pair of split inner sealing ring sections located within said groove for engagement with the inner periphery of said outer section, the combined width of said inner sealing sections being less than the width of said outer section, an expander spring engaging with said inner sealing sections, the construction of the engaging surfaces of said inner and outer ring sections being characterized by the fact that said inner sealing sections are moved axially in opposite directions into sealing engagement with opposite sides of said groove under the expanding action of said spring, the axial movement of said inner sealing sections disposing the same in an unobstructing position with reference to the ported areas of said outer ring section and the passage of oil between said areas and the port of said groove.

2,098,902
PISTON RING
Fredrick A. Luthy, Jackson, Mich.
Application November 12, 1936, Serial No. 110,447
1 Claim. (Cl. 309—27)



A multipart piston ring comprising an outer ring generally rectangular in cross-section and having an inner edge thereof chamfered to provide a face inclined to the axis of said outer ring, a sealing ring in the form of a relatively small wire, a relatively flat expanding spring member of substantially greater longitudinal dimension than said sealing ring and approximating the longitudinal dimension of said outer ring, said sealing ring being fixed to said spring member along one edge thereof and adapted to be positioned thereby for engagement with said chamfered edge.

2,098,903
RETAINING MEANS FOR LOOSE AGGREGATES
Kemper Slidell, Madison, Wis., assignor to C. F. Burgess Laboratories, Inc., Chicago, Ill., a corporation of Delaware
Application December 31, 1935, Serial No. 57,024
3 Claims. (Cl. 210—24)

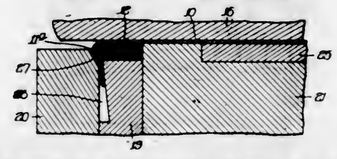


1. Means for packing for shipment a container having loose aggregate material therein partially filling the same and having an opening above the surface of said material, said opening being of smaller dimensions than the internal dimensions of said container, comprising a collapsible partition in said container and a compression member confined between said partition and an inner wall of said container for pressing said partition against said material, said partition and said compression member being insertable through said opening of said container.

2,098,904
LUBRICATING MEANS FOR SEWING MACHINES
Max L. Waterman, Fairfield, Conn., assignor to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey
Application July 18, 1935, Serial No. 31,955
7 Claims. (Cl. 112—256)

1. A sewing machine comprising a bed, a standard secured thereto and provided in its forward wall with an open face cavity, a loop-taker shaft journaled in the bed, a loop-taker secured to said shaft and provided with a bobbin-case raceway, and means for supplying lubricant to said raceway comprising a sight-feed oil-cup supported by said bed and located within said cavity and conduit means connecting said oil-cup with said raceway.

2,098,905
POWDER FILLING MACHINE
Charles J. Westin and Albert Donaghy, Sr., Philadelphia, Pa., assignors to F. J. Stokes Machine Company, Philadelphia, Pa., a corporation of Pennsylvania
Application October 12, 1934, Serial No. 748,047
Renewed September 28, 1937
10 Claims. (Cl. 226—99)

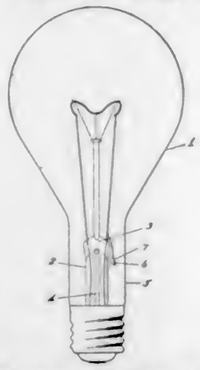


1. In a powder-packing machine, the combination of, a conveyor for intermittently moving a plurality of cans to be filled, a plurality of holders horizontally fixed to said conveyor, a plurality of cups in said holders mounted for limited vertical movement, a guide rail adjacent to said conveyor, means on each of said holders for movably supporting said holders on said guide rail, and means for lifting each of said cups in succession during the filling operation.

7. In a can-filling machine, a hopper for containing powder to be fed, an auger for feeding powder from said hopper, a drive-shaft for driving the moving parts of said machine, connections between said drive-shaft and said auger, a clutch controlling the connection of said connections to said drive-shaft, a brake for stopping said connections and said drive-shaft upon disconnection of said clutch, a clutch-lever actuating said clutch and said brake in interlocking relation, a cam driven from said drive-shaft, a spring stressing said clutch-lever against said cam, a no-can no-fill device located so as to be actuated by the cans to be filled, a clutch-controlling lever actuated by said no-can no-fill device and located so as to be movable into and out of a portion of the path of said clutch-lever thereby controlling the movement of said clutch-lever towards and away from said cam in response to the position of said no-can no-fill device, and means for moving said clutch-controlling lever in the opposite direction to that caused by said no-can no-fill device to free said clutch-lever from the control of said clutch-controlling lever.

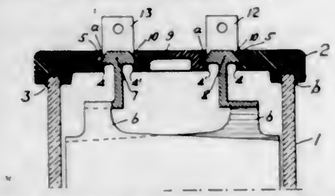
8. In a can-filling machine, a hopper for containing powder to be fed, an outlet for powder for said hopper, first means for feeding powder from said hopper through said outlet, a conveyor for conveying a plurality of cans to be filled with said powder adjacent said outlet, and second means operating simultaneously with said first means for lifting each of said cans in succession from said conveyor so as to hold the lifted can adjacent to but spaced from said outlet during the initial part of said lifting so as to provide an outlet for air from said can and for lifting said lifted can into contact with said outlet during a latter part of the lifting of said can.

2,098,906
METHOD OF MAKING CLOSURE CAPS
William P. White, Glencoe, Ill., assignor to White Cap Company, Chicago, Ill., a corporation of Delaware
Application December 1, 1933, Serial No. 700,417
15 Claims. (Cl. 113—80)



1. A method for making a closure cap for packing vessels which comprises providing a shell having a top portion and a peripheral skirt depending therefrom, providing a gasket which is made of plastic sealing material and is smaller in diameter than the internal diameter of the skirt, inserting the gasket within the compass of the skirt, squeezing the plastic gasket against the top of the shell and thereby increasing the circumferential size of the gasket, and contracting a portion of the skirt below the gasket to a size less than the circumferential size of the gasket.

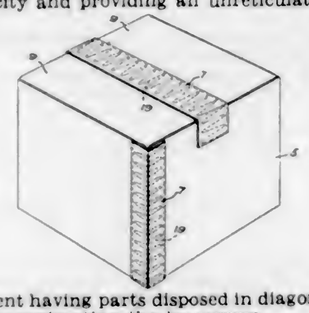
2,098,907
INCANDESCENT ELECTRIC LAMP AND METHOD OF MANUFACTURE THEREOF
Rolland M. Zabel, Lynnfield, Mass., assignor to Hygrade Sylvania Corporation, Salem, Mass., a corporation of Massachusetts
Application March 31, 1936, Serial No. 71,834
9 Claims. (Cl. 176—2)



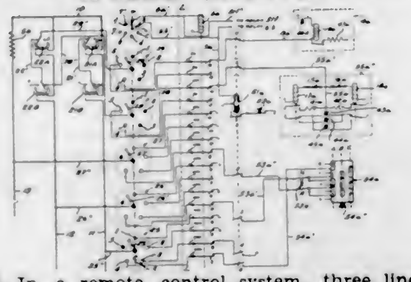
1. The method of making an incandescent electric lamp whereby its luminous output is maintained during life, which includes the steps of, applying to the interior surface of a lamp bulb a thin transparent coating consisting of a water bearing anti-discoloration material, fixing to a

lamp mount a getter consisting of a material which in its oxide form has a high affinity for water vapor, sealing said lamp bulb to the stem bearing said mount, subjecting the lamp to an

exhaust schedule comprising successive flushings and exhaustions, then oxidizing the material, continuing the schedule, and then sealing-off the lamp.



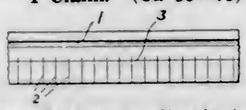
2,098,908
STORAGE BATTERY
Cornelius Ambruster, Glenside, Pa., assignor to The Electric Storage Battery Company, Philadelphia, Pa., a corporation of New Jersey
Application March 27, 1936, Serial No. 71,269
5 Claims. (Cl. 136—80)



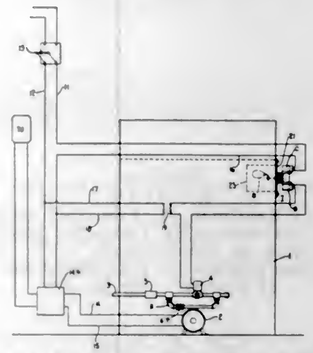
1. For a storage battery cell including plate groups and a rectangular container, a cover and a plate support comprising metal straps spaced inward from the side walls of the container and from which the plate groups are suspended, a rectangular frame of insulating material on the top rim of the container and having marginal portions extending inward from the sides of the container to the straps to provide with the straps a part of the cover, said frame underlying the ends of the straps to support them and the weight of the plate group in line with the end walls of the receptacle, and insulation filling the space between the straps to complete the receptacle cover.

2,098,909
BOX STAY
Edward H. Angier, Framingham, Mass., assignor to Edward H. Angier, Framingham, Mass., as trustee
Application August 8, 1935, Serial No. 35,299
1 Claim. (Cl. 229—49)

A stay strip for adhesive application along box corners and for like purposes comprising two ribbon-like strips of paper united by adhesive and having between them and received in said adhesive between their longitudinal edges a substantially single reinforcing strand disposed along the length of the tape in a zigzag of rapid periodicity and providing an unreticulated reinforcement having parts disposed in diagonal positions approximating the transverse.

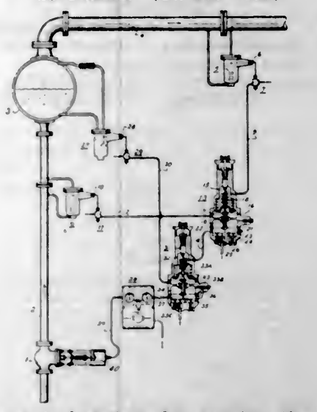


2,098,910
REMOTE CONTROL SYSTEM
Eli J. Blake, Haddonfield, N. J.; Elsie A. Blake, executrix of said Eli J. Blake, deceased
Application July 26, 1933, Serial No. 682,229
38 Claims. (Cl. 246—3)



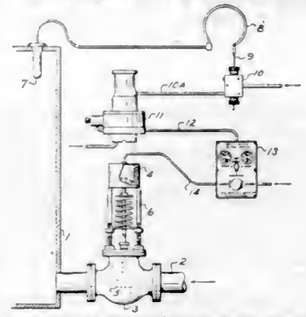
1. In a remote control system, three lines, means including a source of current for impressing current of different characteristics simultaneously on each line and means for selecting the impressed current characteristics in accordance with a code involving successive impulses and a combination of current characteristics on each line in each impulse.

2,098,911
GOODYEAR WELT
William Brown, Quakertown, Pa., assignor to McAdoo & Allen Welting Company, Quakertown, Pa., a partnership consisting of William McAdoo, Jr., Henry M. McAdoo, and George H. Allen.
Application March 3, 1937, Serial No. 128,735
1 Claim. (Cl. 36—78)



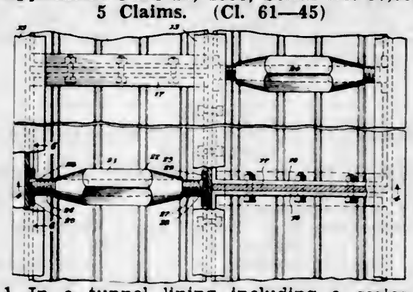
A unitary Goodyear welt adapted to be cemented to an outsole and provided on its flesh side with a series of spaced crosswise ranging slashes extending inward from its outside edge and stopping short of its stitch groove and provided to a uniform depth with a slash ranging lengthwise of the welt and undercut toward the stitch groove and intersecting the first mentioned slashes, and which reduces the fibrous density of the stock of the welt and opposes shearing at the cement.

2,098,912
CONTROL DEVICE FOR HEATING SYSTEMS
Earnest J. Dillman, Detroit, Mich., assignor to Detroit Lubricator Company, Detroit, Mich., a corporation of Michigan
Application April 22, 1935, Serial No. 17,631
8 Claims. (Cl. 122—448)



4. In a heating system having a boiler adapted to contain water and a heating means for the boiler, means operable upon a decrease in the level of the water in the boiler below a predetermined level for supplying water thereto, and means operable upon a decrease in the level of the water below said predetermined level for discontinuing both the supplying of heat and the supplying of water to the boiler.

2,098,913
CONTROL SYSTEM
Paul S. Dickey, Cleveland, Ohio, assignor to Bailey Meter Company, a corporation of Delaware
Application February 25, 1935, Serial No. 8,023
25 Claims. (Cl. 122—451)



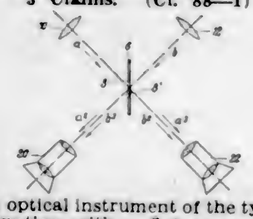
21. A control system for varying the rate of application of an agent to maintain a condition at a desired value, comprising in combination, means for establishing a first fluid pressure in accordance with the rate of application of the agent, means for establishing a second fluid pressure in accordance with the magnitude of the condition, means under the control of the first fluid pressure to maintain the rate of application of the agent constant, and means under the control of the second fluid pressure for varying the constant rate of application maintained by said first fluid pressure.

2,098,914
CONTROL SYSTEM
Harvard H. Gorrie, Cleveland Heights, Ohio, assignor to Bailey Meter Company, a corporation of Delaware
Application February 25, 1935, Serial No. 8,047
11 Claims. (Cl. 50—10)

1. In a control system, in combination, a fluid pressure conduit, valve means having a neutral position and in said conduit to control the magnitude of the pressure in that portion of the conduit beyond said valve means, means for displacing said valve means from the neutral position to admit pressure fluid to that portion of said conduit beyond said valve means upon departure of a condition to be controlled in one direction from a predetermined value and for displacing said valve means from the neutral position to discharge pressure fluid from that portion of said conduit beyond said valve means upon departure of the condition in opposite direction from the predetermined value, means for restoring the valve to the neutral position controlled by the pressure of the fluid within that portion of said conduit beyond said valve means, and means controlled by the pressure of the fluid within that portion of the conduit beyond said valve means for preventing the valve from remaining in neutral position until the condition attains a predetermined value.

2,098,915
TUNNEL LINING
Anthony Foukal, Cleveland, Ohio, assignor to Truscon Steel Company, Youngstown, Ohio, a corporation of Michigan
Application June 24, 1936, Serial No. 87,089
5 Claims. (Cl. 61—45)

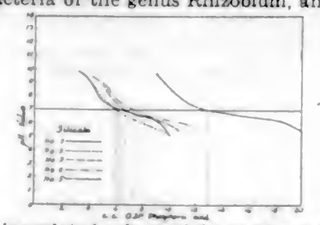
1. In a tunnel lining including a series of courses of liner plates, and circumferential load-



bearing members between the courses, thrust-resisting members permanently mounted between adjacent plates in each course, the ends of the said members being in abutting relation with the circumferential load-bearing members.

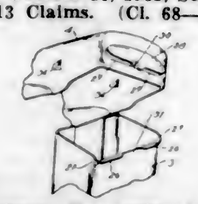
2,098,916
TYPOGRAPHICAL MATRIX
Herman R. Freund, Brooklyn, N. Y., assignor to Intertype Corporation, Brooklyn, N. Y., a corporation of New York
Application July 8, 1937, Serial No. 152,643
7 Claims. (Cl. 199—49)

1. A matrix for use in a typographical machine having slug casting means presenting a constant datum line and means for alining matrices at different unequally spaced heights relatively to said datum line, said matrix having type forming characters thereon the datum lines of which are located at different unequally spaced heights corresponding respectively to the heights at which the matrices are alined by said alining means.



2,098,917
OPTICAL INSTRUMENT
Wolfgang Günther, Berlin-Friedenau, Germany, assignor to Askania-Werke A. G., vormals Centralwerkstatt-Dessau und Carl Bamberg-Friedenau, a corporation of Germany
Application September 21, 1936, Serial No. 101,826
In Germany September 20, 1935
3 Claims. (Cl. 88—1)

1. In an optical instrument of the type set forth the combination with a flat screen adapted to reflect about one half of the light rays thrown thereupon and allowing the other half to pass therethrough, of two objectives of equal focal length symmetrically arranged relatively to said screen for cooperation therewith in such manner, that the bundles of light rays issuing from said objectives intersect at said screen under equal angles thereto, and two eye pieces symmetrically arranged relatively to said screen for cooperation therewith and with said objectives, in such manner, that the optical paths of travel of the two bundles of light rays passing from the objectives to the eye pieces are of equal length.



2,098,918
BACTERIA CULTURE AND PRODUCTION THEREOF
Adolph A. Hendrickson, Oak Park, Ill., assignor to The Albert Dickinson Company, Chicago, Ill., a corporation of Illinois
Application May 14, 1934, Serial No. 725,587
4 Claims. (Cl. 195—59)

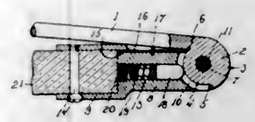
1. The improvement in the art of producing bacteria cultures for seed inoculation which consists in preparing silicate gels having a silicon-dioxide molecular concentration of from 0.1 to 0.5 mol. per liter and containing the essential elements for microbial growth, inoculating said gels with bacteria of the genus Rhizobium, and nurs-

ing the inoculated gels until development thereon of an organism of said bacteria in the form of a film.

2,098,919
WRINGER
Walter L. Kauffman II, Erie, Pa., assignor to Lovell Manufacturing Company, Erie, Pa., a corporation of Pennsylvania
Application October 16, 1935, Serial No. 45,280
13 Claims. (Cl. 68—32)

1. In a wringer, the combination of a frame comprising hollow metal stiles, one of the stiles at least having a lip bent outwardly from the top of the stile to form a shoulder, the lip having a web at its edges joining the wall of the stile with the lip; and a top bar having a downwardly extending end wall overlapping the outer face of the stile and having a shoulder engaging the under side of the lip.

2,098,920
WRINGER
Walter L. Kauffman II, Erie, Pa., assignor to Lovell Manufacturing Company, Erie, Pa., a corporation of Pennsylvania
Application October 16, 1935, Serial No. 45,281
7 Claims. (Cl. 68—32)



1. In a wringer, the combination of a frame comprising hollow metal stiles, one of the stiles at least having a dual stabbing with a bridge portion between the stabbings, said stabbings forming a shoulder each side of the bridge; and a top bar having a downwardly extending end wall overlapping the outer face of the stile and having an interlocking means engaging the shoulders.

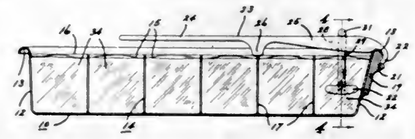
2,098,921
SPECTACLE JOINT
Gurney Lee Mandaville, Fort Pierce, Fla.
Application May 8, 1935, Serial No. 20,491
10 Claims. (Cl. 88—53)

2. In spectacles, an end piece, means to secure the same to a lens, a temple hingedly connected

to said end piece, combined with means for limiting the unfolding movement of the temple to a normal position for use, said temple having a

seat and a yieldable stop member carried by said end piece for engaging said seat to limit the folding movement of the temple.

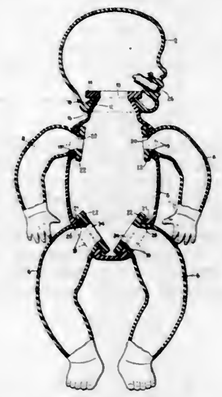
2,098,922
APPARATUS FOR MAKING CABLE
Edgar W. McKnight, Bayonne, N. J., assignor to General Cable Corporation, New York, N. Y., a corporation of New Jersey
Application January 8, 1934, Serial No. 705,793
15 Claims. (Cl. 117—20)



1. Apparatus for manufacturing compact cable having a core and a plurality of overlying layers of helically laid wires initially having shapes such that deep valleys exist therebetween, which comprises, in combination, means for moving the core lengthwise, a plurality of stranding units for successively applying overlying layers of helically laid wires about the moving core, and means for compressing and altering the shapes of the wires of each layer, layer by layer to substantially eliminate deep valleys from the layer surface before the next layer is applied, said last mentioned means comprising sets of grooved rolls, each set forming a pass with a continuous periphery.

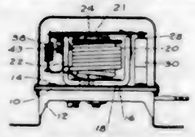
2,098,923
PROCESS OF PREPARING AMINOACETIC ACID
Edwin T. Mertz, Chicago, Ill., assignor to Armour and Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application February 15, 1937, Serial No. 125,929
6 Claims. (Cl. 260—119)

2. The process of preparing aminoacetic acid which comprises subjecting the neck ligaments of cattle to acid hydrolysis and recovering aminoacetic acid from the hydrolyzate.



2,098,924
REFRIGERATING APPARATUS
Edward B. Newill, Dayton, Ohio, assignor to General Motors Corporation, Dayton, Ohio, a corporation of Delaware
Application May 27, 1936, Serial No. 82,098
6 Claims. (Cl. 62—108.5)

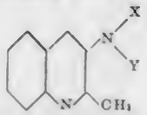
1. In combination, a relatively shallow tray of the type adapted to be inserted in or placed on a cooling element of a household refrigerating apparatus and adapted to contain a substance to be frozen, a unitary grid structure within said tray dividing the interior thereof into a plurality of molds, a member embedded in the frozen substance within one of said molds and having a portion thereof extending outwardly therefrom, means for removing the frozen substance together with said grid structure from said tray, said means including a lever having a handle portion and an end portion pivotally engaging a por-



tion of said tray, said lever having a portion intermediate the handle and said end portions thereof attached to said extending portion of said member, and said lever being adapted when moved about its pivotal engagement with said tray to pry said grid structure and the frozen substance from the tray.

2,098,925
DOLL
Edward G. Schaeffer, Brooklyn, N. Y., assignor to American Character Doll Co., Inc., New York, N. Y., a corporation of New York
Application June 25, 1936, Serial No. 87,135
2 Claims. (Cl. 46—117)

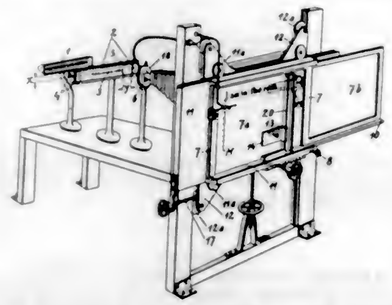
1. A hollow non-collapsible doll molded from resilient material of which the interior of the body, head, arms and legs, are in free open intercommunication with each other through movable joints and coact to form a single air reservoir of the capacity of the entire doll, said doll having substantially its entire exposed surface formed of thin walled molded rubber and thus capable of being squeezed at any portion thereof to place the body of contained air therein under pressure different from the external atmospheric pressure, the head being fashioned to provide a constricted opening at the mouth, and an air pressure actuated sound producing device mounted in the head with its rear end exposed to the pressure in the air reservoir and outer end supported by the face portion and concealed from view back of the mouth and disposed to discharge sound through the mouth whereby squeezing any part of the doll will cause sound to emanate from the doll's mouth.



2,098,926
ELECTROMAGNET
William G. Schneider, Maumee, Ohio, assignor to The Electric Auto-Lite Company, Toledo, Ohio, a corporation of Ohio
Application February 2, 1934, Serial No. 709,491
7 Claims. (Cl. 200—87)

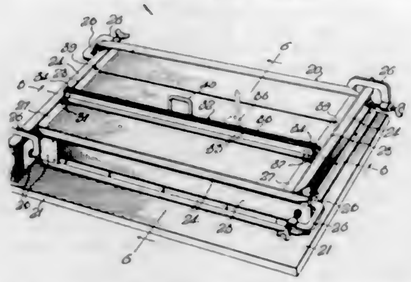
1. In a device of the character disclosed, the combination of a magnetic core; an energizing coil thereon; a magnetic member having portions extending across one end of said core and along opposite sides thereof; a movable armature co-acting with said core and substantially bridging the side portions of said magnetic member; a bracket having a slot therein and a lateral end projecting portion; a thermo-responsive member secured at one end to said bracket and at the other end to said armature acting as a hinge for connecting said bracket to said armature; a coil spring secured at one end to said armature and at its other end to the lateral projecting portion of said bracket; and means on one side portion of said magnetic member cooperating with the slot in said bracket for adjustably securing said bracket to one of the side portions of said magnetic member and thereby adjustably positioning the armature with respect to said core, the thermo-responsive hinge being arranged to move the armature with respect to said core upon variations of temperature to compensate for changes in the electrical resistance of the coil.

2,098,927
3-AMINO-QUINALDINE DERIVATIVES AND A PROCESS OF PREPARING THEM
Ludwig Schörnig, Frankfort-on-the-Main, Germany, assignor to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware
No Drawing. Application August 10, 1935, Serial No. 35,670. In Germany August 16, 1934
9 Claims. (Cl. 260—38)



6. The compounds of the general formula:

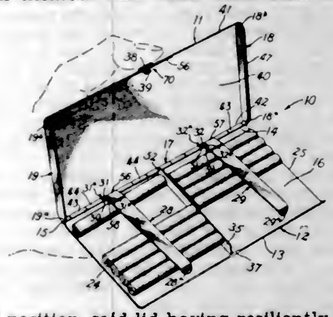
wherein X means a member of the group consisting of hydrogen and methyl and Y means a member of the group consisting of methyl and phenyl.



2,098,928
JUSTIFICATION OF LINES OF TYPE MATTER IN PHOTOTYPE COMPOSING
Lajos Wenczler, Augsburg, Germany, assignor to Uhertype Aktiengesellschaft, Glarus, Switzerland, a corporation of Switzerland
Application May 27, 1935, Serial No. 23,597
In Great Britain May 28, 1934
8 Claims. (Cl. 95—4.5)

1. In photographic type-composing, the method of justifying the non-justified lines of type-matter to be photographically reproduced, which comprises separately exposing each individual element or part of the pattern line in a reproduction camera while at the same time masking all the other parts of said line, and advancing between each two successive exposures the carrier of the sensitized layer a distance corresponding

to the amount by which the spacing between consecutive type-matter must be varied so as to obtain the required length of line.

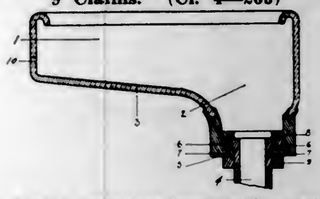


2,098,929
BLOCK OR SLAB MOLDING MEANS AND METHOD
George L. Barnes, Terre Haute, Ind.
Application August 11, 1936, Serial No. 95,457
7 Claims. (Cl. 25—121)

1. A mold comprising a marginal frame, at least one vertical partition plate extending across said frame, the upper edge of said partition plate being disposed below the upper edge of said frame, whereby the material being molded may extend over said upper edge of said partition plate, and means for accurately guiding a tool for cutting the material down to said edge of said partition plate for the purpose set forth.

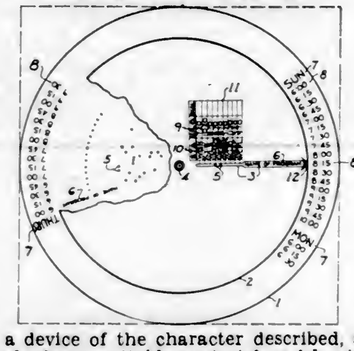
2,098,930
CIGARETTE CASE CONSTRUCTION
Alfred F. Reilly, North Attleboro, Mass., assignor to Evans Case Company, North Attleboro, Mass., a corporation of Massachusetts
Application May 4, 1935, Serial No. 19,797
1 Claim. (Cl. 206—41)

A cigarette case having a length sufficient to receive two groups of cigarettes, arranged longitudinally of the case, said case comprising a bottom member having end walls, and a lid hinged to one side of the bottom member and having a central partition for separating the groups of cigarettes, the lid being generally flat and without end walls, whereby the cigarettes may be removed by longitudinal movement from said lid, the ends of the lid being adapted to contact said bottom member end walls when said lid is in



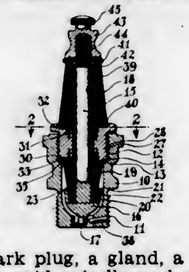
closed position, said lid having resiliently pressed means removably retaining the cigarettes.

2,098,931
TWISTING MACHINE
Irving R. Rowe and Edward E. Bradley, Stonington, Conn., assignors to The Atwood Machine Company, Stonington, Conn., a corporation of New Jersey
Application October 3, 1935, Serial No. 43,340
6 Claims. (Cl. 117—29)



1. A twisting machine for textiles comprising in combination, a pair of feed rolls, means to rotate said rolls, racks supporting a plurality of bobbins above said rolls, a plurality of guiding means for said threads disposed between said bobbins and rolls, one of said guiding means being fixed in position below said rolls, and a guiding member for said threads above said rolls movable vertically up and down as said rolls are stopped and started.

2,098,932
DENTAL CUSPIDOR
Jacob A. Saffir, Rockford, Ill., assignor of one-half to Oscar H. Pieper and one-half to Alphonse F. Pieper, both of Rochester, N. Y.
Application January 10, 1936, Serial No. 58,461
9 Claims. (Cl. 4—263)

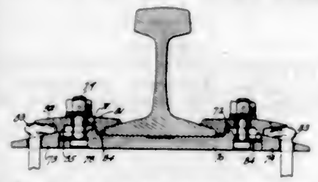


1. A dental cuspidor bowl with waste outlet eccentrically positioned and a waste pipe leading from said waste outlet of bowl and at the junction of waste outlet of bowl and waste pipe, a movable joint structure allowing horizontal movement of said cuspidor bowl.

2,098,933
ROTATABLE INFORMATION FINDER
Chester Adrian Hathaway, Davenport, Iowa
Application July 29, 1933, Serial No. 682,890
1 Claim. (Cl. 40—70)

In a device of the character described, a base formed of any suitable material and having informational matter thereon, a disc rotatably mounted on said base with said informational material radially disposed as to said disc and immediately adjacent to the circumference thereof, additional information on the base beneath the disc, a slot in the disc thru which said additional information can be read, a pointer between the slot and the circumference of the disc, dots located on the base beneath the disc, a table of classified information on the disc, and connecting lines from the slot to the classified information on the disc.

2,098,934
SPARK PLUG
Julius Devine, New York, N. Y.
Application February 25, 1937, Serial No. 127,610
5 Claims. (Cl. 123—169)

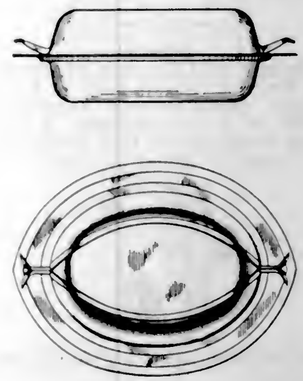


1. In a spark plug, a gland, a spindle, insulation between said spindle and said gland, said gland having a portion removed therefrom leaving a thin sleeve against the insulation, a wedge ring adapted to be forced into the removed portion and forcing the sleeve against the insulation.

2,098,935
TIE-PLATE ASSEMBLY
Newton F. Foner, Pittsburgh, Pa.
Application June 18, 1936, Serial No. 85,935
9 Claims. (Cl. 238—338)

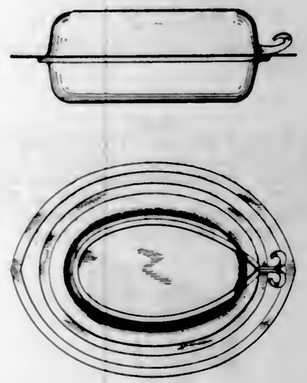
1. A rail fastening comprising a plate to be secured to a tie and to serve as a rest for a rail,

the plate having its longitudinal contour substantially uniform and transversely continuous in the direction of rail length from the rolling of a



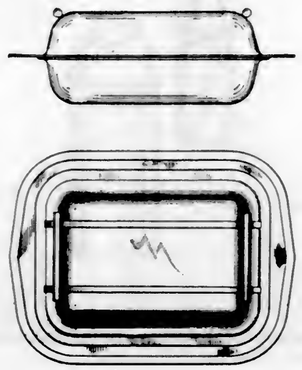
section from which the plate is sheared during manufacture, a pair of spaced holes in the plate shaped to permit the insertion of a bolt head into each hole from the top of the plate, the under surface of the plate adjacent the hole being recessed and spaced from the bottom plane of the plate to provide space to receive the head of the bolt after it is so inserted, with the body of the plate serving as a side-wall closure at one side of the recess to provide a side-stop for the bolt head, a shearing strip on top of the plate adjacent each recess and extending transversely of the plate, a bolt with a head to fit into the hole and into the recessed space under the plate against the side wall, and a clamping plate to be held in position by the bolt and serving in turn to hold the bolt head in the recessed space to prevent shifting of the bolt from the recess, the clamping plate overlying the rail base and embodying a shearing strip to engage the edge of said rail base and extending therefrom to said shearing strip on the plate.

DESIGNS



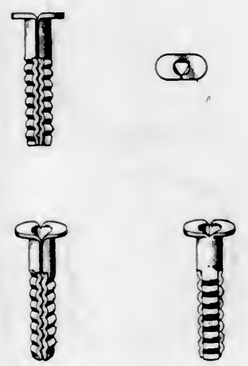
NOVEMBER 9, 1937

106,858
DESIGN FOR A COVERED DISH OR SIMILAR ARTICLE
Minn S. Cornell, Jr., Middletown, Conn., assignor to The Middletown Silver Company, Middletown, Conn., a corporation of Connecticut
Application July 13, 1937, Serial No. 70,384
Term of patent 7 years



The ornamental design for a covered dish or similar article as shown.

106,859
DESIGN FOR A COVERED DISH OR SIMILAR ARTICLE
Minn S. Cornell, Jr., Middletown, Conn., assignor to The Middletown Silver Company, Middletown, Conn., a corporation of Connecticut
Application July 13, 1937, Serial No. 70,385
Term of patent 7 years

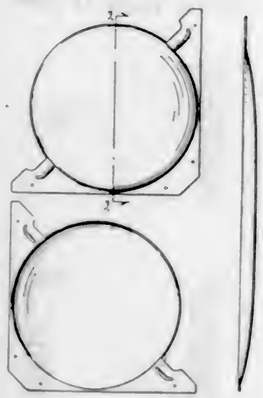


The ornamental design for a covered dish or similar article as shown.

106,860
DESIGN FOR A COVERED DISH OR SIMILAR ARTICLE
Minn S. Cornell, Jr., Middletown, Conn., assignor to The Middletown Silver Company, Middletown, Conn., a corporation of Connecticut
Application July 13, 1937, Serial No. 70,386
Term of patent 7 years

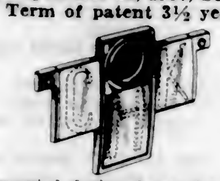
The ornamental design for a covered dish or similar article as shown.

106,861
DESIGN FOR A NAIL DRIVE ANCHOR
Paul C. Dellinger, Lancaster, Pa., assignor to U. S. Expansion Bolt Company, New York, N. Y., a corporation of New York
Application August 13, 1937, Serial No. 71,069
Term of patent 14 years



The ornamental design for a nail drive anchor, as shown and described.

106,862
DESIGN FOR A COMBINED BOTTLE AND CUP
Henry Dreyfuss, New York, N. Y., assignor to The American Thermos Bottle Company, Norwich, Conn., a corporation of Ohio
Application May 26, 1937, Serial No. 69,558
Term of patent 14 years



The ornamental design for a combined bottle and cup as shown.

106,863
DESIGN FOR A BRACE FOR SCREEN DOORS AND THE LIKE
Ernest R. Erickson, Des Moines, Iowa, assignor to C. E. Erickson Company, Incorporated, Des Moines, Iowa, a corporation of Iowa
Application June 7, 1937, Serial No. 69,712
Term of patent 3½ years

The ornamental design for a brace for screen doors and the like substantially as shown.

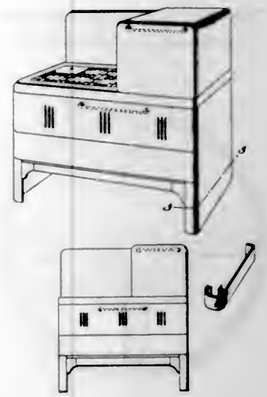
106,864
DESIGN FOR A CHARACTER BEARING UNIT
Joseph B. Federico, Niagara Falls, N. Y., assignor to Hickok Manufacturing Company, Inc., Rochester, N. Y., a corporation of New York
Application September 24, 1937, Serial No. 71,778
Term of patent 3½ years

The ornamental design for a character bearing unit, as shown.

106,865
DESIGN FOR A CHARACTER BEARING UNIT
Joseph B. Federico, Niagara Falls, N. Y., assignor to Hickok Manufacturing Company, Inc., Rochester, N. Y., a corporation of New York
Application September 24, 1937, Serial No. 71,779
Term of patent 3½ years

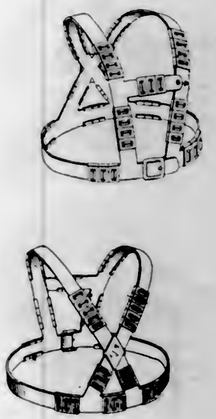
The ornamental design for a character bearing unit, as shown.

106,866
DESIGN FOR A CHARACTER BEARING UNIT
Joseph B. Federico, Niagara Falls, N. Y., assignor to Hickok Manufacturing Company, Inc., Rochester, N. Y., a corporation of New York
Application September 24, 1937, Serial No. 71,780
Term of patent 3½ years



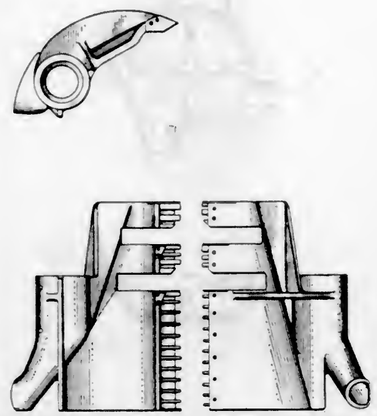
The ornamental design for a character bearing unit as shown.

106,867
DESIGN FOR A CHARACTER BEARING UNIT
Joseph B. Federico, Niagara Falls, N. Y., assignor to Hickok Manufacturing Company, Inc., Rochester, N. Y., a corporation of New York
Application September 24, 1937, Serial No. 71,781
Term of patent 3½ years



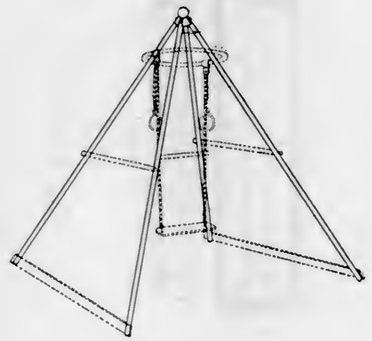
The ornamental design for a character bearing unit as shown.

106,868
DESIGN FOR A RANGE
Rudolph Hoffman, Lorain, Ohio, assignor to American Stove Company, St. Louis, Mo., a corporation of New Jersey
Application July 26, 1937, Serial No. 70,669
Term of patent 14 years



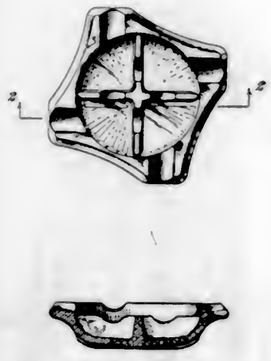
The ornamental design for a range as shown.

106,869
DESIGN FOR A SAFETY DEVICE FOR PEDESTRIANS
Thomas Earle Miller, Nashville, Tenn.
Application March 15, 1937, Serial No. 68,163
Term of patent 14 years



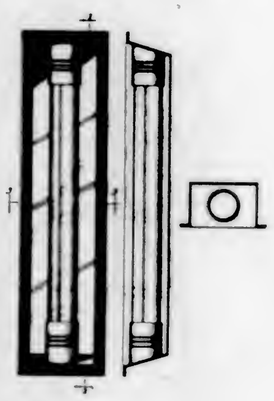
The ornamental design for a safety device for pedestrians, as shown.

106,870
DESIGN FOR A SCRAPER FOR CENTRIFUGAL SEPARATING MACHINES AND ANALOGOUS ARTICLES
Joseph S. Pecker, Philadelphia, Pa., assignor to American Centrifugal Corporation, New York, N. Y., a corporation of Delaware
Application February 2, 1937, Serial No. 67,411
Term of patent 3½ years



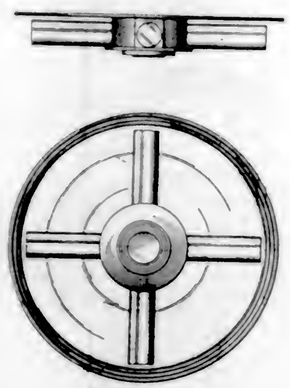
The ornamental design for a scraper for centrifugal separating machines and analogous articles, as shown.

106,871
DESIGN FOR A PLAYGROUND APPARATUS
Carl D. Spangler, Oklahoma City, Okla.
Application March 18, 1937, Serial No. 68,259
Term of patent 7 years



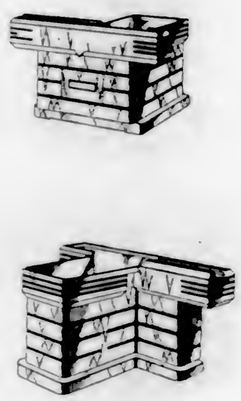
The ornamental design for a playground apparatus, as shown, and described.

106,872
DESIGN FOR AN ASHTRAY
James E. Spence, Wheeling, W. Va., assignor to Hazel-Atlas Glass Company, Wheeling, W. Va., a corporation of West Virginia
Application August 18, 1937, Serial No. 71,185
Term of patent 7 years



The ornamental design for an ashtray, as shown.

106,873
DESIGN FOR A LIGHTING FIXTURE OR SIMILAR ARTICLE
Lemuel L. Stewart, Chicago, Ill., assignor to The Adlake Company, a corporation of Illinois
Application May 10, 1937, Serial No. 69,265
Term of patent 14 years



The ornamental design for a lighting fixture or similar article, substantially as shown.

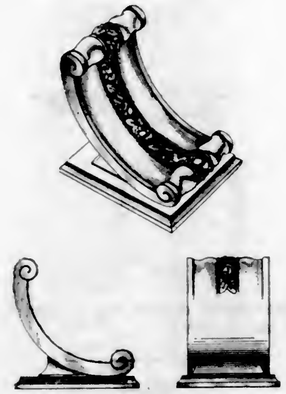
106,874
DESIGN FOR A LIGHTING FIXTURE OR SIMILAR ARTICLE
Lemuel L. Stewart, Chicago, Ill., assignor to The Adlake Company, a corporation of Illinois
Application May 10, 1937, Serial No. 69,271
Term of patent 14 years

The ornamental design for a lighting fixture or similar article, substantially as shown.

106,875
DESIGN FOR A MACHINE TOOL BASE
Harold Van Doren, Toledo, Ohio, assignor to Ex-Cell-O Corporation, a corporation of Michigan
Application April 14, 1937, Serial No. 68,752
Term of patent 14 years

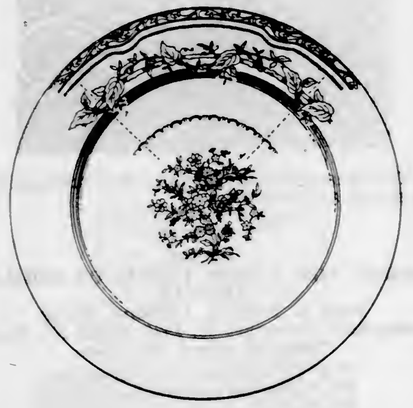
The ornamental design for a machine tool base substantially as shown and described.

106,876
DESIGN FOR A BADGE
Ralph O. Yardley, Stockton, Calif., assignor to The Association of 20-30 Clubs, Sacramento, Calif., a corporation of California
Application January 4, 1937, Serial No. 66,889
Term of patent 14 years



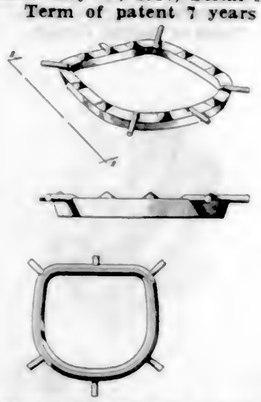
The ornamental design for a badge, as shown.

106,877
DESIGN FOR A HOLLOW DOUBLE-WALL GLASS REFLECTOR
Carl E. Anderson and Carl R. Palmer, Steubenville, Ohio
Application August 28, 1935, Serial No. 58,347
Term of patent 14 years



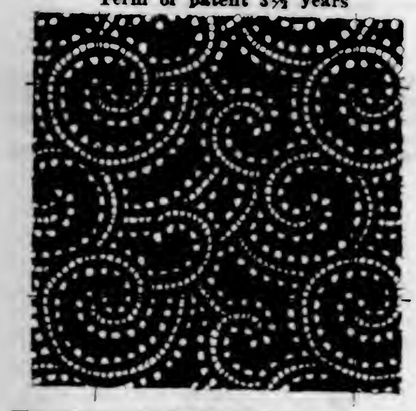
The ornamental design for a hollow double-wall glass reflector, substantially as shown and described.

106,878
DESIGN FOR A BOOK END OR SIMILAR ARTICLE
Louis V. Aronson, Newark, N. J., assignor to Art Metal Works, Inc., Newark, N. J., a corporation of New Jersey
Application September 21, 1937, Serial No. 71,705
Term of patent 7 years



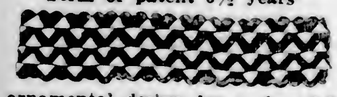
The ornamental design for a book end or similar article, substantially as shown.

106,879
DESIGN FOR A PLATE OR SIMILAR ARTICLE
Yukio Buma, New York, N. Y., assignor to Morimura Bros. Inc., New York, N. Y., a corporation of Japan
Application March 4, 1937, Serial No. 67,992
Term of patent 7 years



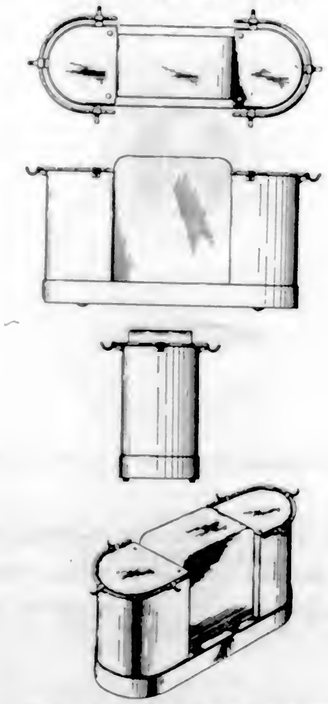
The ornamental design for a plate or similar article, as shown and described.

106,880
DESIGN FOR A DENTAL FLASK ATTACHMENT
Dayton Bumgardner and Alexander B. Pickands, Chicago, Ill.
Application May 21, 1937, Serial No. 69,470
Term of patent 7 years



The ornamental design for a dental flask attachment, as shown.

106,881
DESIGN FOR A LACE
Bert Edson, Pawtucket, R. I., assignor to New England Lace Mills, Inc., New York, N. Y.
Application October 5, 1937, Serial No. 71,962
Term of patent 3½ years

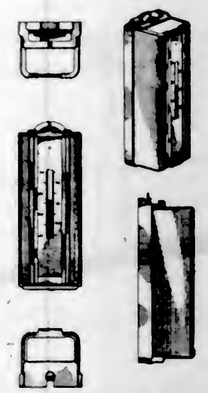


The ornamental design for a lace substantially as shown and described.

106,882
DESIGN FOR A SHOE FABRIC OR SIMILAR ARTICLE
John A. Fogarty, Portland, Maine
Application November 30, 1936, Serial No. 66,195
Term of patent 3½ years

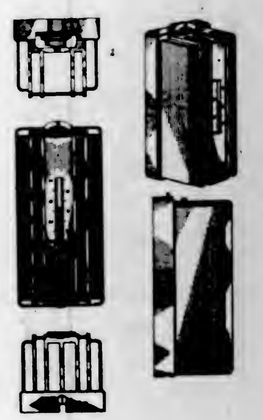
The ornamental design for a shoe fabric or similar article, substantially as shown and described.

106,883
DESIGN FOR A DISPENSER FOR LUBRICANTS OR THE LIKE
Charles W. Ginter, Bryan, Ohio, assignor to The Aro Equipment Corporation, Bryan, Ohio, a corporation of Ohio
Application August 9, 1937, Serial No. 70,940
Term of patent 7 years



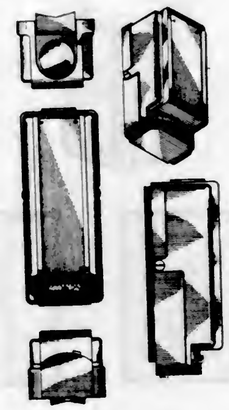
The ornamental design for a dispenser for lubricants or the like substantially as shown.

106,884
DESIGN FOR A HOSTESS CART
John C. Gridley, Alhambra, Calif.
Application April 12, 1937, Serial No. 68,713
Term of patent 7 years



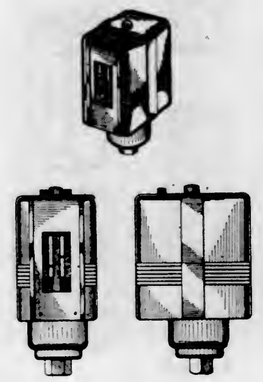
The ornamental design for a hostess cart, substantially as shown and described.

106,885
DESIGN FOR AN AIR CONDITIONING CONTROL
Clarence R. T. Hess, Prairie View, Ill., assignor to Perfex Corporation, Milwaukee, Wis., a corporation of Wisconsin
Application August 12, 1937, Serial No. 71,038
Term of patent 7 years



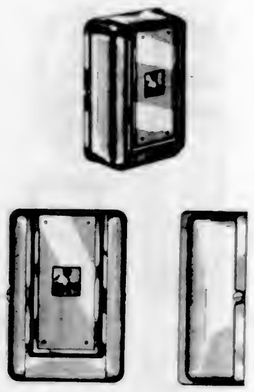
The ornamental design for an air conditioning control, substantially as shown.

106,886
DESIGN FOR AN AIR CONDITIONING CONTROL
Clarence R. T. Hess, Prairie View, Ill., assignor to Perfex Corporation, Milwaukee, Wis., a corporation of Wisconsin
Application August 12, 1937, Serial No. 71,039
Term of patent 7 years



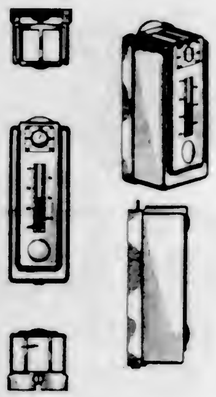
The ornamental design for an air conditioning control, substantially as shown.

106,887
DESIGN FOR AN AIR CONDITIONING CONTROL
Clarence R. T. Hess, Prairie View, Ill., assignor to Perfex Corporation, Milwaukee, Wis., a corporation of Wisconsin
Application August 12, 1937, Serial No. 71,040
Term of patent 7 years



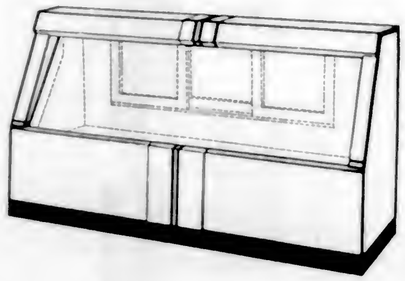
The ornamental design for an air conditioning control, substantially as shown.

106,888
DESIGN FOR AN AIR CONDITIONING CONTROL
Clarence R. T. Hess, Prairie View, Ill., assignor to Perfex Corporation, Milwaukee, Wis., a corporation of Wisconsin
Application August 12, 1937, Serial No. 71,041
Term of patent 7 years



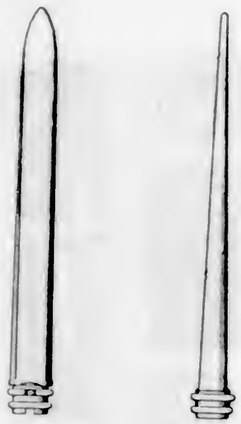
The ornamental design for an air conditioning control, substantially as shown.

106,889
DESIGN FOR AN AIR CONDITIONING CONTROL
Clarence R. T. Hess, Prairie View, Ill., assignor to Perfex Corporation, Milwaukee, Wis., a corporation of Wisconsin
Application August 12, 1937, Serial No. 71,042
Term of patent 7 years



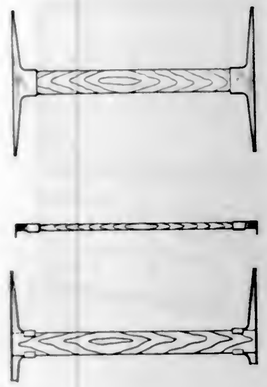
The ornamental design for an air conditioning control, substantially as shown.

106,890
DESIGN FOR AN AIR CONDITIONING CONTROL
Clarence R. T. Hess, Prairie View, Ill., assignor to Perfex Corporation, Milwaukee, Wis., a corporation of Wisconsin
Application August 12, 1937, Serial No. 71,043
Term of patent 7 years



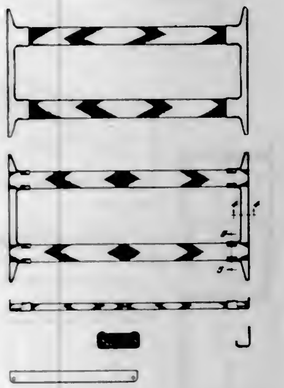
The ornamental design for an air conditioning control, substantially as shown.

106,891
DESIGN FOR A REFRIGERATOR DISPLAY CABINET
George J. Hopkins, Kendallville, Ind., assignor to McCray Refrigerator Company, Kendallville, Ind., a corporation of Indiana
Application August 4, 1937, Serial No. 70,843
Term of patent 7 years



The ornamental design for a refrigerator display cabinet as shown and described.

106,892
DESIGN FOR A BOBBIN FOR LOOM SHUTTLES OR SIMILAR ARTICLES
William J. McGeough, Providence, R. I., assignor to U. S. Bobbin & Shuttle Company, Providence, R. I., a corporation of Rhode Island
Application November 13, 1936, Serial No. 65,892
Term of patent 14 years

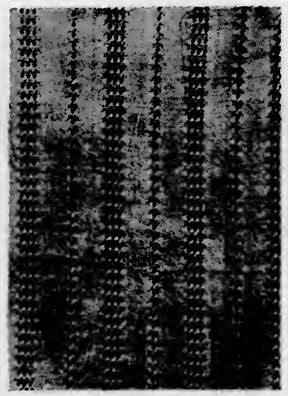


The ornamental design for a bobbin for loom shuttles or similar articles, substantially as shown and described.

106,893
DESIGN FOR A CHAIR RUNG
Roy F. McMahan, Louisville, Ky.
Application February 23, 1937, Serial No. 67,781
Term of patent 14 years

The ornamental design for a chair rung, as shown.

106,894
DESIGN FOR A CHAIR RUNG
Roy F. McMahan, Louisville, Ky.
Application April 30, 1937, Serial No. 69,071
Term of patent 14 years

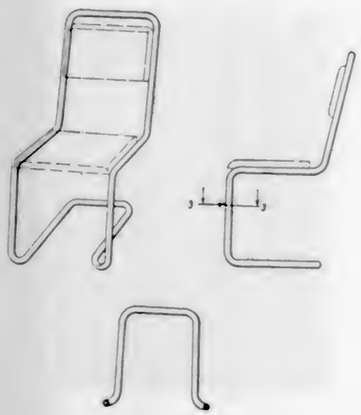


The ornamental design for a chair rung, as shown.

106,895
DESIGN FOR A DRESS
Margaret Michelson, New York, N. Y.
Application October 6, 1937, Serial No. 71,992
Term of patent 3½ years

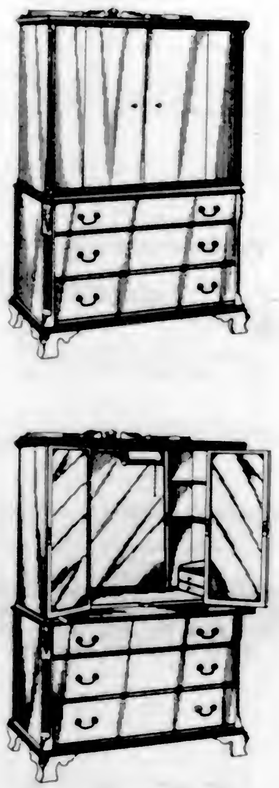
The ornamental design for a dress, substantially as shown, and described.

106,896
DESIGN FOR A KNITTED FABRIC
Jack Minoff, Newark, N. J.
Application September 29, 1937, Serial No. 71,855
Term of patent 14 years

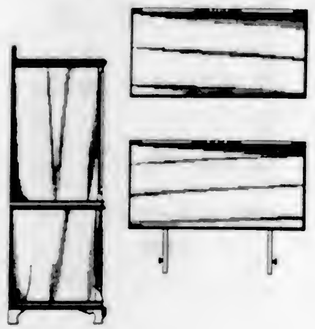


The ornamental design for a knitted fabric substantially as shown.

106,897
DESIGN FOR A KNITTED FABRIC
Jack Minoff, Newark, N. J.
Application September 29, 1937, Serial No. 71,856
Term of patent 14 years

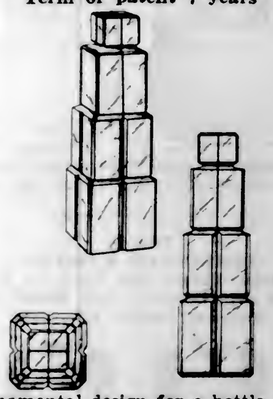


The ornamental design for a knitted fabric substantially as shown.

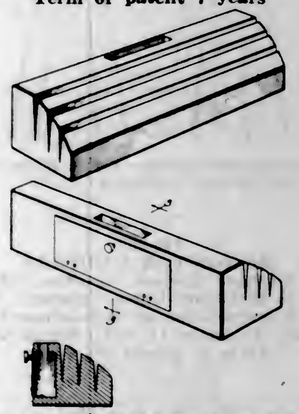


106,898
DESIGN FOR A CHAIR OR THE LIKE
Morris R. Moody, Troy, Ohio, assignor to The Troy Sunshade Company, Troy, Ohio, a corporation of Ohio
Application February 25, 1937, Serial No. 67,839
Term of patent 3½ years

The ornamental design for a chair or the like, substantially as shown and described.



106,899
DESIGN FOR A COMBINED BUREAU AND WARDROBE
Floyd H. Newmaker, Warren, Pa.
Application September 10, 1937, Serial No. 71,559
Term of patent 3½ years

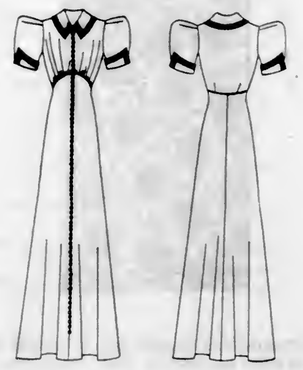


The ornamental design for a combined bureau and wardrobe, as shown.

106,900
DESIGN FOR A BOTTLE
Walter Nuckols, Summit, N. J., assignor to Helena Rubinstein, Inc., New York, N. Y., a corporation of New York
Application September 11, 1937, Serial No. 71,576
Term of patent 7 years

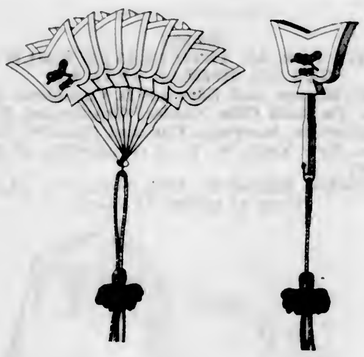
The ornamental design for a bottle, as shown.

106,901
DESIGN FOR A COMBINED COMB SUPPORT AND RAZOR BLADE DEPOSITORY
Howard Pena, Chicago, Ill.
Application July 14, 1937, Serial No. 70,436
Term of patent 7 years



The ornamental design for a combined comb support and razor blade depository as shown.

106,902
DESIGN FOR A FLOWER VASE HOLDER
Thomas S. Perez, Berkeley, Calif.
Application October 5, 1936, Serial No. 65,173
Term of patent 3½ years



The ornamental design for a flower vase holder substantially as shown.

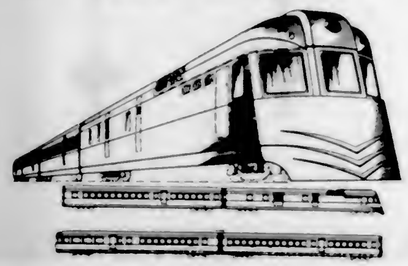
106,903
DESIGN FOR A DRESS
Tellie Quaranto, New York, N. Y.
Application October 4, 1937, Serial No. 71,945
Term of patent 3½ years

The ornamental design for a dress substantially as shown and described.

106,904
DESIGN FOR A CRIB-FAN
Candido M. Ramos, Delano, Calif.
Application July 28, 1937, Serial No. 70,707
Term of patent 7 years

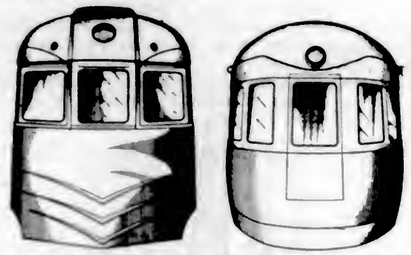
The ornamental design for a crib-fan, as shown.

106,905
DESIGN FOR A TEXTILE FABRIC OR SIMILAR ARTICLE
Willard D. Roberson, New York, N. Y., assignor to Yale Fabrics Corp., New York, N. Y.
Application October 8, 1937, Serial No. 72,076
Term of patent 3½ years



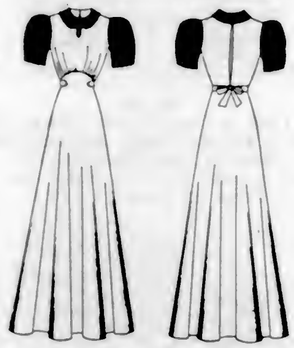
The ornamental design for a textile fabric or similar article as shown and described.

106,906
DESIGN FOR AN ADVERTISING DISPLAY BAND
Roscoe C. Ziringer, Pittsburgh, Pa.
Application September 3, 1936, Serial No. 64,702
Term of patent 3½ years

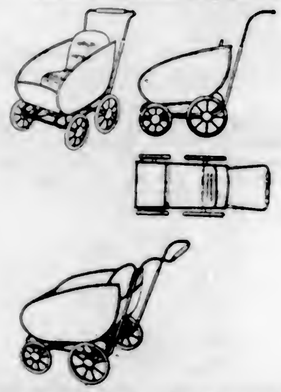


The ornamental design for an advertising display band, as shown and described.

106,907
DESIGN FOR AN ARTICULATED RAILWAY CAR OR SIMILAR ARTICLE
Isaac C. Barlow and Edmund D. Campbell, Berwick, Pa., and Otto Kuhler, Grantwood, N. J., assignors to American Car and Foundry Company, New York, N. Y., a corporation of New Jersey
Application August 29, 1936, Serial No. 64,640
Term of patent 14 years

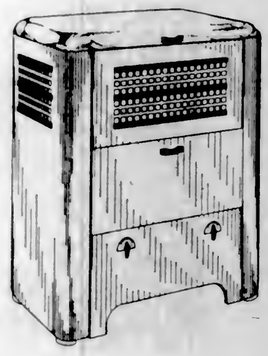


106,907—Continued



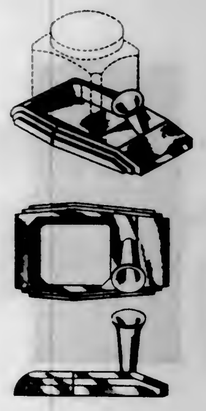
The ornamental design for an articulated railway car or similar article as shown, and described.

106,908
DESIGN FOR A DRESS
Elyon Blavet, New York, N. Y.
Application September 23, 1937, Serial No. 71,743
Term of patent 3½ years



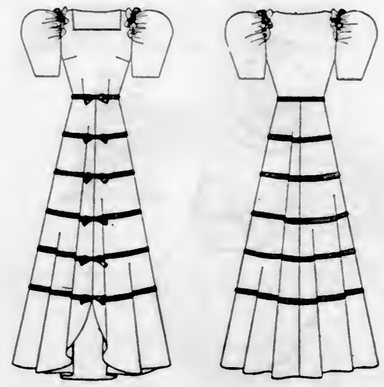
The ornamental design for a dress substantially as shown and described.

106,909
DESIGN FOR A GOCART
William Gerhard Carlson, Gardner, Mass., assignor to Hedstrom-Union Company, Gardner, Mass., a corporation of Massachusetts
Application February 17, 1937, Serial No. 67,722
Term of patent 3½ years



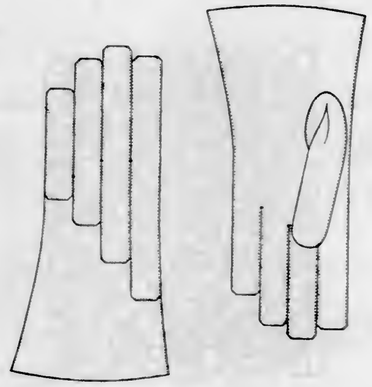
The ornamental design for a gocart as shown.

106,910
DESIGN FOR A HEATER CABINET
Mervin F. Cotes and Walter C. Schneider, Lansing, Mich., assignors to Motor Wheel Corporation, Lansing, Mich., a corporation of Michigan
Application May 10, 1937, Serial No. 69,278
Term of patent 3½ years



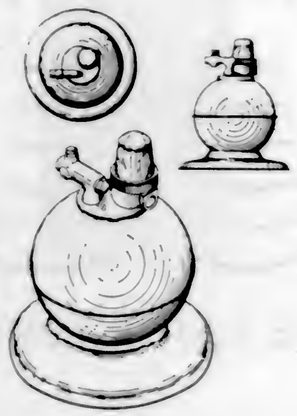
The ornamental design for a heater cabinet as shown and described.

106,911
DESIGN FOR A PEN AND INK DESK-STAND
William F. Deppermann, Orange, N. J., assignor to S. S. Stafford, Inc., New York, N. Y., a corporation of New York
Application March 20, 1937, Serial No. 68,291
Term of patent 7 years



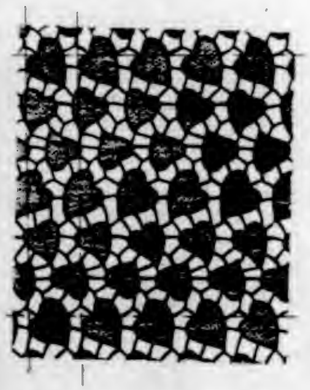
The ornamental design for a pen and ink desk-stand, as shown and described.

106,912
DESIGN FOR A DRESS
Rose Feintuck, New York, N. Y.
Application August 4, 1937, Serial No. 70,830
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

106,913
DESIGN FOR A GLOVE
John E. Fuchs, New York, N. Y.
Application September 20, 1937, Serial No. 71,689
Term of patent 3½ years



The ornamental design for a glove substantially as shown.

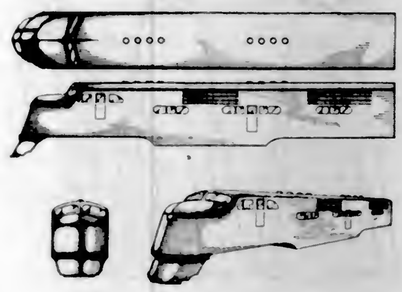
106,914
DESIGN FOR A GEAR CASE FLUSHER OR SIMILAR ARTICLE
Charles W. Ginter, Bryan, Ohio, assignor to The Aro Equipment Corporation, Bryan, Ohio, a corporation of Ohio
Application August 4, 1937, Serial No. 70,848
Term of patent 7 years

The ornamental design for a gear case flusher or similar article as shown.

106,915
DESIGN FOR A LACE
Abe A. Goldstein, New York, N. Y.
Application October 11, 1937, Serial No. 72,109
Term of patent 3½ years

The ornamental design for a lace substantially as shown and described.

106,916
DESIGN FOR A LACE
Abe A. Goldstein, New York, N. Y.
Application October 11, 1937, Serial No. 72,110
Term of patent 3½ years

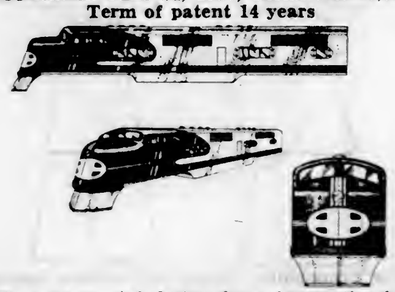


The ornamental design for a lace substantially as shown and described.

106,917
DESIGN FOR A TEXTILE FABRIC OR SIMILAR ARTICLE OF MANUFACTURE
Bruno Haertel, Providence, R. I., assignor to A. D. Juilliard & Co., Inc., New York, N. Y., a corporation of Delaware
Application February 14, 1936, Serial No. 61,176
Term of patent 3½ years

The ornamental design for a textile fabric or similar article of manufacture substantially as shown and described.

106,918
DESIGN FOR A LOCOMOTIVE BODY
Harold L. Hamilton and Richard M. Dilworth, La Grange, and Martin P. Blomberg, Hinsdale, Ill., and Leland A. Knickerbocker and Chris J. Klein, Detroit, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application June 24, 1937, Serial No. 70,028
Term of patent 14 years

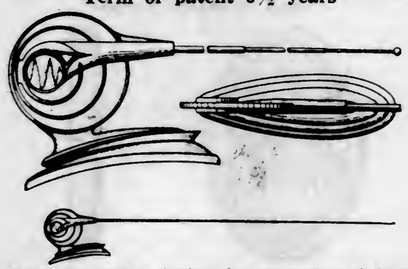


The ornamental design for a locomotive body substantially as shown and described.

106,919
DESIGN FOR A LOCOMOTIVE BODY
Harold L. Hamilton and Richard M. Dilworth, La Grange, and Martin P. Blomberg, Hinsdale, and Leland A. Knickerbocker and Chris J. Klein, Detroit, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application June 24, 1937, Serial No. 70,029
Term of patent 14 years

The ornamental design for a locomotive body substantially as shown and described.

106,920
DESIGN FOR A LOCOMOTIVE BODY
Harold L. Hamilton and Richard M. Dilworth, La Grange, Martin P. Blomberg, Hinsdale, and William D. Otter, River Forest, Ill., and Leland A. Knickerbocker and Chris J. Klein, Detroit, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application June 24, 1937, Serial No. 70,030
Term of patent 14 years



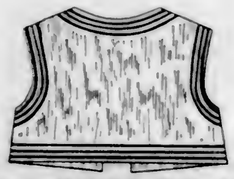
The ornamental design for a locomotive body substantially as shown and described.

106,921
DESIGN FOR A DRESS
Jack Kirschner, New York, N. Y.
Application July 3, 1937, Serial No. 70,244
Term of patent 3½ years

The ornamental design for a dress, substantially as shown, and described.

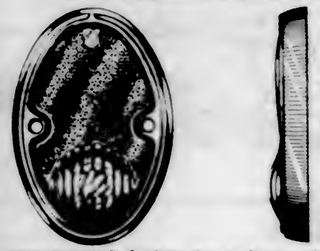
106,922
DESIGN FOR AN AUTOMOBILE ROOF AERIAL
Roman Kopanski, Cleveland, Ohio, assignor to The Ward Products Corporation, Cleveland, Ohio
Application September 13, 1937, Serial No. 71,601
Term of patent 3½ years

The ornamental design for an automobile roof aerial, as shown.

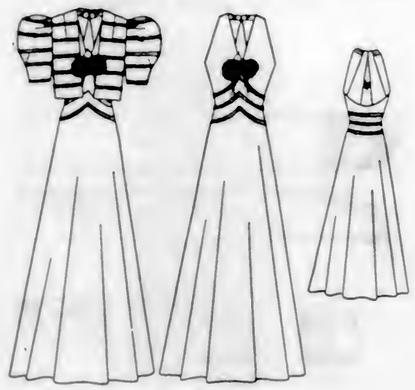


106,923
DESIGN FOR A DRESS
Florence Laye, New York, N. Y.
Application October 6, 1937, Serial No. 71,991
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.



106,924
DESIGN FOR A BOLERO JACKET
Charles Lewis, New York, N. Y.
Application September 30, 1937, Serial No. 71,882
Term of patent 3½ years

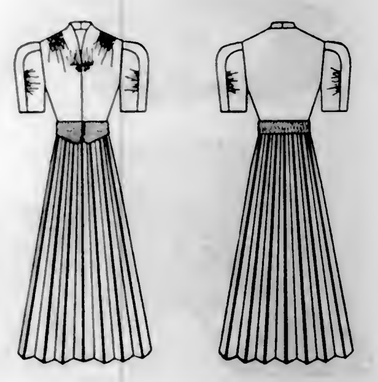


The ornamental design for a bolero jacket, substantially as shown and described.

106,925
DESIGN FOR A LAMP CLOSURE
Howard C. Mead, Anderson, Ind., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application April 26, 1935, Serial No. 56,592
Term of patent 7 years

The ornamental design for a lamp closure, as shown.

106,926
DESIGN FOR A DRESS ENSEMBLE
Margaret Michelson, New York, N. Y.
Application October 6, 1937, Serial No. 71,993
Term of patent 3½ years

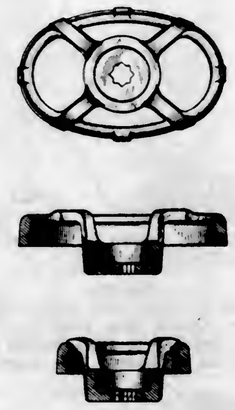


The ornamental design for a dress ensemble, substantially as shown, and described.

106,927
DESIGN FOR A CAMERA
Joseph Mihalyi, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application September 23, 1937, Serial No. 71,763
Term of patent 14 years

The ornamental design for a camera as shown and described.

106,928
DESIGN FOR A DRESS
David Rosenthal, New York, N. Y.
Application October 2, 1937, Serial No. 71,930
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

106,929
DESIGN FOR A DRESS
David Rosenthal, New York, N. Y.
Application October 6, 1937, Serial No. 71,995
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

106,930
DESIGN FOR A HANDWHEEL
Vincent P. Rumely, Chicago, Ill., assignor to Crane Co., Chicago, Ill., a corporation of Illinois
Application September 3, 1937, Serial No. 71,445
Term of patent 14 years

The ornamental design for a handwheel, substantially as shown.

106,931
DESIGN FOR A SWEATER
Frank Sheindelman, New York, N. Y.
Application October 6, 1937, Serial No. 71,996
Term of patent 3½ years

The ornamental design for a sweater, substantially as shown and described.

106,932
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Leo Sholtz, New York, N. Y.
Application October 5, 1937, Serial No. 71,966
Term of patent 3½ years

The ornamental design for a shoe or similar article, substantially as shown.

106,933
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Leo Sholtz, New York, N. Y.
Application October 5, 1937, Serial No. 71,967
Term of patent 3½ years

The ornamental design for a shoe or similar article, substantially as shown.

106,934
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Leo Sholtz, New York, N. Y.
Application October 5, 1937, Serial No. 71,969
Term of patent 3½ years

The ornamental design for a shoe or similar article, substantially as shown.

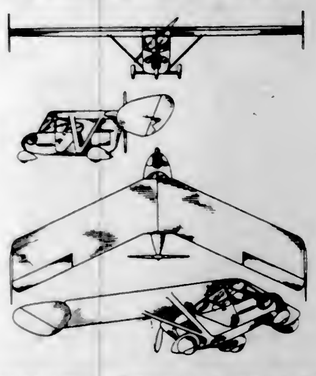
106,935
DESIGN FOR A SHOE OR SIMILAR ARTICLE
Leo Sholtz, New York, N. Y.
Application October 5, 1937, Serial No. 71,970
Term of patent 3½ years

The ornamental design for a shoe or similar article, substantially as shown.

106,936
DESIGN FOR A NEGLIGEE
Ethel Eaton Stricker, New York, N. Y.
Application October 8, 1937, Serial No. 72,055
Term of patent 3½ years

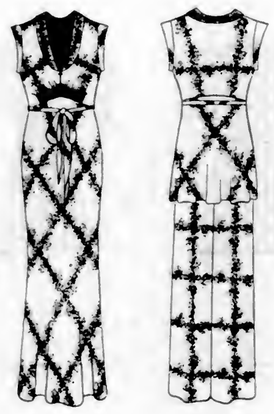
The ornamental design for a negligee, substantially as shown and described.

106,937
DESIGN FOR A KNITTED SWEATER
Leslie M. Sobo, New York, N. Y.
Application September 18, 1937, Serial No. 71,672
Term of patent 3½ years



The ornamental design for a knitted sweater, as shown and described.

106,938
DESIGN FOR AN AERIAL FOR AUTOMOBILES
David A. Vaughan, Woodstock, N. Y.
Application October 9, 1937, Serial No. 72,104
Term of patent 3½ years

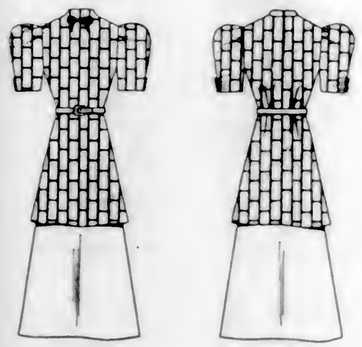


The ornamental design for an aerial for automobiles, as shown and described.

106,939
DESIGN FOR AN AIRPLANE
Waldo D. Waterman, Santa Monica, Calif.
Application February 8, 1937, Serial No. 67,508
Term of patent 3½ years

The ornamental design for an airplane, as shown and described.

106,940
DESIGN FOR A GOWN PAJAMA
Harry Weisman, New York, N. Y.
Application September 20, 1937, Serial No. 71,688
Term of patent 3½ years



The ornamental design for a gown pajama substantially as shown.

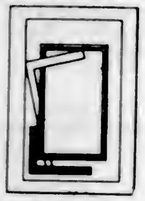
106,941
DESIGN FOR A DRESS
Philip Wenett, New York, N. Y.
Application October 11, 1937, Serial No. 72,105
Term of patent 3½ years

The ornamental design for a dress, substantially as shown, and described.

106,942
DESIGN FOR A DRESS
Pauline Fracchia, New York, N. Y.
Application October 12, 1937, Serial No. 72,125
Term of patent 3½ years

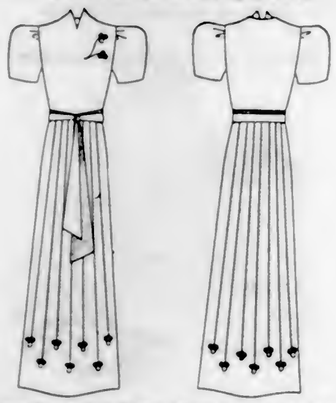
The ornamental design for a dress, substantially as shown, and described.

106,943
DESIGN FOR A DRESS
Pauline Fracchia, New York, N. Y.
Application October 12, 1937, Serial No. 72,127
Term of patent 3½ years



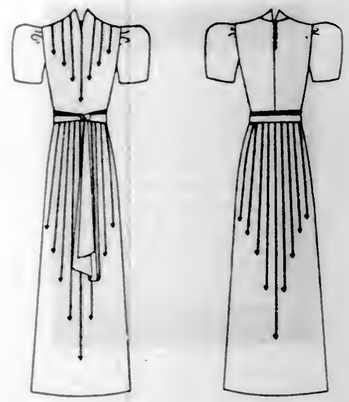
The ornamental design for a dress, substantially as shown.

106,944
DESIGN FOR A DRESS
Pauline Fracchia, New York, N. Y.
Application October 12, 1937, Serial No. 72,128
Term of patent 3½ years



The ornamental design for a dress, substantially as shown.

106,945
DESIGN FOR A TRADING STAMP
Chadwick J. Hays and Gertrude D. Hays, Lansing, Mich.
Application August 27, 1937, Serial No. 71,354
Term of patent 7 years



The ornamental design for a trading stamp, as shown.

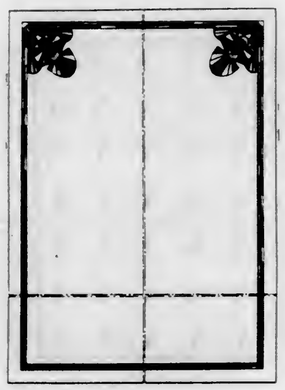
106,946
DESIGN FOR A DRESS
Jacob J. Kushner, New York, N. Y.
Application October 11, 1937, Serial No. 72,111
Term of patent 3½ years

The ornamental design for a dress, substantially as shown.

106,947
DESIGN FOR A DRESS
Jacob J. Kushner, New York, N. Y.
Application October 11, 1937, Serial No. 72,112
Term of patent 3½ years

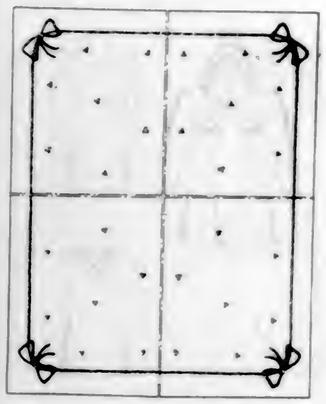
The ornamental design for a dress, substantially as shown.

106,948
DESIGN FOR A DRESS
Sidney J. Poster, New York, N. Y.
Application October 8, 1937, Serial No. 72,056
Term of patent 3½ years



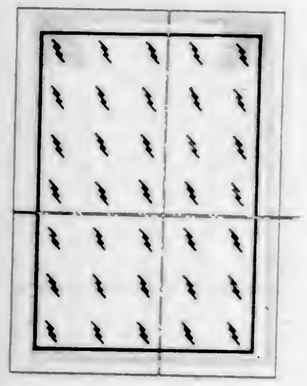
The ornamental design for a dress, substantially as shown.

106,949
DESIGN FOR A COAT
Samuel Rosenblatt, New York, N. Y.
Application September 30, 1937, Serial No. 71,873
Term of patent 3½ years



The ornamental design for a coat, substantially as shown.

106,950
DESIGN FOR A SCARF OR SIMILAR ARTICLE
Sydelle Rosen, New York, N. Y.
Application September 30, 1937, Serial No. 71,877
Term of patent 3½ years

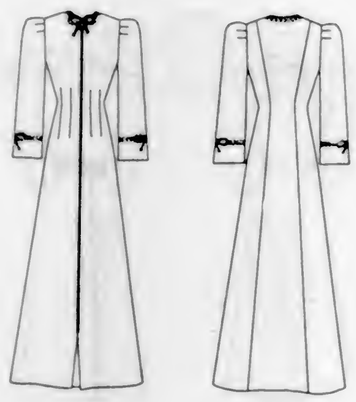


The ornamental design for a scarf or similar article, substantially as shown, and described.

106,951
DESIGN FOR A SCARF OR SIMILAR ARTICLE
Sydelle Rosen, New York, N. Y.
Application September 30, 1937, Serial No. 71,878
Term of patent 3½ years

The ornamental design for a scarf or similar article, substantially as shown, and described.

106,952
DESIGN FOR A SCARF OR SIMILAR ARTICLE
Sydelle Rosen, New York, N. Y.
Application September 30, 1937, Serial No. 71,879
Term of patent 3½ years



The ornamental design for a scarf or similar article, substantially as shown, and described.

106,953
DESIGN FOR A SCARF OR SIMILAR ARTICLE
Sydelle Rosen, New York, N. Y.
Application September 30, 1937, Serial No. 71,880
Term of patent 3½ years

The ornamental design for a scarf or similar article, substantially as shown, and described.

106,954
DESIGN FOR A NEGLIGEE
Ethel Eaton Stricker, New York, N. Y.
Application September 27, 1937, Serial No. 71,819
Term of patent 3½ years

The ornamental design for a negligee, substantially as shown and described.

Patents Nos. 2,098,936 to 2,099,669

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office

Vol. 484—No. 3 TUESDAY, NOVEMBER 16, 1937 Price—$16 per year

The OFFICIAL GAZETTE is mailed under the direction of the Superintendent of Documents, Government Printing Office, to whom all subscriptions should be made payable and all communications respecting the Gazette should be addressed. Issued weekly. Subscriptions, $16.00 per annum, including annual index, $18.75; single numbers, 25 cents each.

PRINTED COPIES OF PATENTS are furnished by the Patent Office at 10 cents each. For the latter address the Commissioner of Patents, Washington, D. C.

CIRCULARS OF GENERAL INFORMATION concerning PATENTS or concerning TRADE-MARKS, PRINTS, and LABELS will be sent without cost on request to the Commissioner of Patents, Washington, D. C.

Adverse Decisions in Interference

Where the claims of a patent are affected by adverse decision or concession of priority as the result of an interference, a notice as to the patented claims thus affected will be published in the OFFICIAL GAZETTE after final decision in the proceedings.

Cross-References in Cases Relating to Same Subject

RULE 43. When an applicant files two or more applications relating to the same subject matter of invention, all showing but only one claiming the same thing, the applications not claiming it must contain references to the application claiming it.

NOTICE

Board of Appeals—Decisions—Time for Response

U. S. PATENT OFFICE, *Washington, January 28, 1935.*

There appears to be some confusion among attorneys and applicants as to the time within which action must be taken in applications following a decision of the Board of Appeals.

The decision of the Board of Appeals is "an action" in the application, and, in order to save the application from abandonment, amendment must be filed within six months from the date of that decision unless an appeal has been taken to the Court of Customs and Patent Appeals or review of the decision sought by a bill in equity under section 4915.

The Examiner will not notify the applicant of the decision of the Board of Appeals.

CONWAY P. COE,
Commissioner.

Reservation Clauses Not Permitted

RULE 44. A reservation for a future application of subject-matter disclosed but not claimed in a pending application will not be permitted in the pending application.

Applicant's Address

The requirement of Rule 33, that the post-office address of the applicant must be stated in the petition, means that the applicant must give the post-office address at which he customarily receives his mail.

The rule was made in order that the Office in necessary cases might correspond directly with the applicant and not through his attorney. The address of the attorney with instructions to send communications to the applicant in his care will not be accepted as a compliance with this rule.

Photostat Copies

In ordering photostat copies of United States and foreign patents, when only the number of the patent is given, the whole patent, comprising specification and drawing, will be furnished, unless the order specifically states that the "specification only" or "drawing only" is required. Care should be taken in making out orders for foreign patents to give the year of the patent, as in old French and British patents the same number may appear in different years.

Adjudicated Patents

(D. C. Del.) Ware patent, No. 1,864,384, for piston, claims 1, 3, and 5 *Held* invalid. *Ware* v. *Pratt & Whitney Aircraft Co.*, 20 F. Supp. 168.

(D. C. Del.) Chapman and Littleford patent, No. 1,968,008, for concentration of minerals, *Held* valid and infringed. *Phosphate Recovery Corporation* v. *Southern Phosphate Corporation*, 20 F. Supp. 153.

Disclaimer

2,050,209.—*Samuel D. Gehman*, Akron, Ohio. WAX-LIKE COMPOSITION. Patent dated August 4, 1936. Disclaimer filed October 30, 1937, by the assignee, *Wingfoot Corporation.*

Hereby enters this disclaimer of each and every claim.

Condition of Applications Under Examination at Close of Business October 30, 1937

(Total number of applications awaiting action, excluding Trade-Mark Division, 42,086; Trade-Mark Division, 1,419. Oldest new case, May 18, 1937; oldest amended, May 1, 1937.)

DECISIONS IN PATENT AND TRADE-MARK CASES

U. S. Court of Customs and Patent Appeals

RUDOLPH *v.* GAWILER

No. 3,794. Decided April 5, 1937

[88 F.(2d) 993]

1. INTERFERENCE—TESTIMONY—CIRCUMSTANCES MUST BE CONSIDERED.

"The reasonableness or unreasonableness of the story told by the appellant must be taken into account. Small facts and circumstances oftentimes throw greater light on the true situation than can be afforded in any other way."

2. SAME—PRIORITY.

Record reviewed and *Held* that testimony of R. is not sufficient to establish that he had a conception of the invention prior to the date of the filing of G's. application and that priority was properly awarded to the latter.

APPEAL from the Patent Office. Affirmed.

Mr. William S. Hodges for Rudolph.

Mr. Richard J. Cook for Gawiler.

GRAHAM, *P. J.:*

This is an appeal from a decision of the Board of Appeals of the United States Patent Office in an interference proceeding in which priority was awarded to the appellee, John Gawiler, on all counts in the interference, which said decision affirmed the decision of the Examiner of Interferences. The subject matter of the interference is expressed in four counts. Count 4 is typical of all the counts, and indicates the subject matter of the interference. It is as follows:

4. A vent protector for egg laying hens comprising a plate, a fastening device in the form of a safety pin fixed rigidly to the top edge of the plate in a manner whereby the pin may be applied through the rump of the hen thereby to operatively suspend the plate over the vent; **the said plate being longitudinally curved to conform to** the adjacent body part of the hen **and being adapted to** swing outwardly for passage of an egg from the vent.

The appellee resides at Toppenish, in the county of Yakima, in the State of Washington, and on January 22, 1932, filed an application for patent on a device to protect the vent of a hen while laying an egg. On June 29, 1933, Maurice L. Rudolph, a resident of Vineland, in the county of Cumberland, in the State of New Jersey, filed an application for a patent for a similar device. Thereafter, on or about November 8, 1933, two interference proceedings were instituted and declared between the application of the party Rudolph and pending applications of Perl Acton, filed July 19, 1933, Meyer N. Dantzig, filed August 26, 1932, and the application of the party Gawiler, filed as aforesaid. On or about October 15, 1934, the parties Acton and Dantzig were eliminated from the interferences, and these later were consolidated into one interference, interference No. 67,223.

Both parties took testimony which will be hereinafter considered. At the conclusion thereof, the Examiner of Interferences was of opinion that the junior party, the appellant, had not sustained the burden of proof resting upon him and awarded priority to the party Gawiler. On appeal to the Board of Appeals, the Board arrived at the same conclusion.

The subject matter of the controversy here is a shield of metal to protect the vent of an egg-laying hen. According to the facts produced, when a hen, especially of the white leghorn variety, lays an egg, the vent is much distended and shows a red appearance, because of the lining mucous membrane of the tube. The hen herself and other hens will be attracted by this appearance and peck at it, especially if the flow of some blood has been occasioned by the egg-laying process. This leads to cannibalism and to injuries which speedily kill the hen. Some of the witnesses testify that very large losses in egg-laying hens have been occasioned for many years because of these "pick-outs," and for many years it has been a matter of serious loss to the poultry farmer. Many experiments have been tried and remedies recommended, usually consisting of recommendations as to the feeding of the hens. Various departments of agriculture and poultry organizations have experimented along these lines, but without apparent success. Very large percentages of birds were lost in this way, in some cases the losses on the farm of the party Gawiler, in a single season, amounting to as many as 500 birds.

Both tribunals of the Patent Office seem to base their conclusions largely upon the character of the evidence produced on behalf of the junior party, and have concluded that it is uncertain and insufficient to overcome the burden which is placed upon the appellant as junior party. It, therefore, becomes necessary for this court to examine the testimony.

The appellee Gawiler is a farmer, principally engaged in raising poultry, at Toppenish, Washington, and had been residing there for thirteen years at the time of the taking of the testimony herein. He testified that he first conceived the idea of a method of protecting his laying hens from these "pick-outs" in attempting to prevent losses from that source. In 1925 he had about 3,000 laying birds in his flocks, and for some years he kept tables showing the losses from that source. In July, 1930, Gawiler had one bird which was wounded, which he removed from the house and attempted to protect by fastening a piece of canvas, 2½ inches by 3 inches, to the rump of the chicken, with a string. This, as he says, gave him a conception of a protecting shield, and from that time on he attempted to prepare one that would be satisfactory. In October of the same year he designed a shield made of a part of an inner tube, which was fastened to the rump by a piece of copper wire. These devices were not permanent, but would tear off. The making of such

devices was recorded in a chart which was offered in evidence.

In July, 1931, the other devices having failed to accomplish the desired purpose, Gawiler made a shield out of galvanized sheet iron, to which a hog ring was attached at the upper end. These were shield-shaped, large enough to cover the vent, and pointed at the top. The hog ring was inserted into a hole in the small end of the shield, and the ring closed through the flesh of the rump of the hen. This shield worked quite satisfactorily. It was offered in evidence. Thereafter, Gawiler showed the shield to a large number of chicken raisers at his place, and made 20 or 30 of them, which were used. Gawiler was still attempting to produce a better shield, and "came on the idea of using a safety pin instead of the hog ring." Samples of these shields were offered in evidence. They were equipped with a No. 2 safety pin, around which the shield was crimped to hold it. The safety pin was inserted through the tip of the rump, laterally, so that the shield would hang directly downward and cover the vent.

Thereafter Gawiler began making shields for sale, and sold a considerable number of them. Some time in December, 1931, molds and dies were ordered from a machine shop in Yakima, Washington. The dies were offered in evidence, and in January, 1932, quantity production was initiated. Fifteen thousand shields were made from these dies at that time, and other dies were procured for greater production. Application for a patent was taken up with an attorney, Mr. Maddox, in November, 1931, and application was duly made.

The shields made by both the old and new dies were sold throughout the United States, and advertising in different poultry magazines was initiated. This was done in January, 1932. Answers were received from various places throughout the United States and orders were received at agencies at various places, one being received in the agency at Washington, D. C. Among other correspondence which Gawiler had at that time, was some with parties at Vineland, New Jersey, where the appellant resided at the time, and in which a party by the name of Everett Keen was attempting to become an agent for the sale of the shields. This letter was dated April 6, 1932. There were also two postal cards received from one Abe Crystal, at Vineland, one dated September 15, 1932, the other December 15, 1932, ordering shields and asking to be made an agent in that territory. On June 5, 1932, his correspondent, Keen, wrote Gawiler to the effect that the party Rudolph, living at Maple Avenue, Vineland, New Jersey, had started to make shields similar to Gawiler's. Thereupon, Cook & Robinson, representing Gawiler, wrote to the appellant, who was then doing business under the name of Rudolph Pick-Out Shield Company, advising him that Gawiler was applying for a patent on the device which he was making, in response to which, on June 12th, the appellant replied that he had been experimenting with this idea for a number of years, and was intending to file an application for a patent.

A circumstance which has been given great weight by the tribunals of the Patent Office, and which appeals with equal force to this court, consists of an advertisement which was issued by Gawiler in marketing his shields. This was in June, 1932. It consisted of a small two-page leaflet. The drawings for the circular were made by A. J. Stahmer, of 72 Columbia Street, Seattle, Washington, from a picture of a hen cut from a magazine and handed to Mr. Stahmer by Gawiler. This picture is printed upon one page of the leaflet which is folded into four pages. On the interior of the leaflet is a representation of the rump and vent of a hen with a shield suspended from a safety pin inserted into the fleshy portion of the rump. These circulars were distributed generally, 5,000 being issued. They were released in June, 1932. Thereafter, Gawiler received a circular from the party Rudolph, which is known in the record as Exhibit No. 23, and a comparison of which will be made with the Gawiler circular, known as Exhibit No. 20, hereinafter.

At the time of the taking of the testimony herein, the appellant was 23 years of age, and lived at Maple Avenue and Spring Road, Vineland, New Jersey. The appellant testified that he first conceived the idea embodied in his shield, which is a practical duplicate of the Gawiler shield, on or about July 4, 1925, when he was 14 years of age. It does not appear that up to that time Rudolph had ever had any experience in farming, or in raising chickens of any kind. He was on a vacation at a poultry farm, and on that day the farmer, one Schultz, had a "pick-out." The farmer tried to protect the vent after the picking was done, by the use of a needle and thread passed into the tail head of the chicken, and to which was attached a piece of cloth. Rudolph watched him, and as he sat looking at the box where the needle and thread were kept, he saw a safety pin, and it occurred to him that the pin would answer the same purpose. His father, he stated, had been a sheet metal worker for many years, and he thought that metal would be better than a cloth, so he procured a piece of a tin can, cut the same out by hand, and attached the safety pin to the top. He put vent holes in the shield to give the chicken air, and had the farmer put the shield on the chicken. He was not able to produce the shield, but states that the chicken died a few days later, and the chicken and shield were thrown away. He states, however, the shield was curved to fit the form of the chicken. Nothing further appears about his activity along this line until 1929, when he was 18 years of age, when he went to the poultry farm of a man by the name of Miller, who was his brother-in-law, and which farm was located at Vineland. He prevailed on Miller to try some shields which he made at that time, and which were substantially like those he says he first conceived.

In September, 1929, he claims Miller used some of these upon chickens for about a month, whereupon Miller sold his chickens and the shields were taken off. None of these shields were offered in evidence by him at that time, although Miller afterwards produced one. Rudolph also claimed that in 1931 he made some shields for his brother, practically the same as those formerly made by him, with a slight indentation to hold the safety pin more firmly. In 1932 the appellant went on a farm, and at the end of 1932 "and about the beginning of 1933" he sold some of his shields made by a machine which he had ordered in October, 1932. This machine was delivered in February, 1933. From that time until the time application for patent was filed, he sold about 1,500. The party Rudolph claims that he delayed application for patent on account of lack of funds, and that as soon as he procured the necessary funds he filed the application, paying the fee with borrowed money. The farmer with whom the party Rudolph was staying at the time of his alleged conception was a man by the name of Schultz, who, although not a relative, was a close friend of Rudolph's father, and came from the same town in Russia. Rudolph testified that he got out his first advertising of his product in March, 1933; that the circular had the picture of a fowl on the outside cover; and that the circular was made by the Standard Printing Company, of Vineland.

On cross-examination, he stated that the picture of the fowl on the circular was furnished by the printing company which had a cut of a chicken, and stated that the drawings and the cut were made in Philadelphia, by the Atlas Photograving Company, located on Sansom Street. These cuts, it is said, were made about the beginning of March, 1933. He also states that drawings were sent to him and that he "okayed" them, and from these the cuts were made. The first circulars, it is stated, were printed by John Daly, of Forty-second and Ogden Streets, Philadelphia, from the cut supplied by the Atlas company in March, 1933. Thereafter, the witness corrected himself and stated that his first cuts were made by the Atlas Photograving Company and printed by John Daly, and that thereafter a new cut was used by the Standard Publishing Company, of Vineland, which had on it a statement that a patent was applied for. None of the drawings for these cuts were produced by the witness.

In support of the testimony of the party Rudolph, Jerome G. Miller testified that in 1929 Rudolph made some "pick-out" shields for his chickens on a small farm at Vineland, and produced one of the shields which was introduced as Exhibit No. 2, and which is practically the shield of the issue. He states that Rudolph told him to throw the shields away when he sold his chickens, but that he still retained about five of them, one of which he had produced. The witness Nathan Schultz testified that in 1925, on July 4th, Rudolph was at his place, made a tin shield and put it on a chicken which had been suffering from a "pick-out"; that he made 5 or 6 shields, but that the chicken died, and he threw the chicken and all of the shields away, as he "did not want any further use of them."

Alfred A. Rudolph, a brother of the appellant, testified that the appellant had been at Mr. Schultz' place in July, 1925, and that the appellant, at that time, told him about having made a shield. He also corroborated his statements about his visit to Miller in 1929, and about having seen shields put on chickens at that time. He also corroborated his brother as to what occurred at the witness' farm in 1931, and that, at that time, appellant made about 500 shields for him, and about his manufacture of the same in 1933. This witness also produced a shield which he claimed had fallen off of a hen at his place "about five or six months after September, 1931." This witness testified that the first drawing was made in March, 1933, and that he made most of the drawings; that he had told an artist that he "wanted a chicken made with a shield on it," and that he, the artist, did all the work.

[1] [2] It was incumbent upon the appellant under the facts in this case to prove at least by a preponderance of evidence that prior to January 22, 1932, appellee's date of filing, that he, the appellant, had conceived and reduced the subject matter of the interference to practice.

If we were to take the testimony of the appellant and the witnesses who testified for him at its face value, it would appear that sufficient proof has been made. However, there are so many circumstances arising in the case that we can find no fault with the tribunals of the Patent Office in failing to find that he has maintained the burden imposed upon him. The reasonableness or unreasonableness of the story told by the appellant must be taken into account. Small facts and circumstances oftentimes throw greater light on the true situation than can be afforded in any other way. When we look to the case, we find a party who, through many years, struggled to solve a problem which had been unsolved for years, and which was exceedingly troublesome. Finally, out of the experiences which he had, through years, and as a result of experimentation, study, and effort, he found a solution. On the other hand, we have a boy, fourteen years of age, city bred and raised, knowing nothing about chickens or farming, who, upon the first occasion that he discovers the presence of a problem, solves it instanter, and without apparent effort. Not only does he at once conceive of the method of prevention, but he seizes upon the materials, makes one, even puts ventilators in it, although, so far as his experience is concerned, it may need nothing of the kind. Time goes on, and he gives no more attention to it, and then, again, we find him making more of the same devices. He says that he saw a safety pin and thought at once that this could be used. To the ordinary person it would appear that this would be a cruel and painful thing to use. In fact, one of the Examiners in the Patent Office, on Gawiler's application, refused it at one time on that ground. However, this boy seems to have known

at once that nothing of the kind would occur, and that it could be used without pain and without loss of egg-laying properties. Even after the hen upon which it was placed had died, and the hen and device had been throw away, he still felt that the invention was a success and repeated it in 1929. Then, again, according to his story, we find him throwing the devices away which Miller had used, although unexpectedly five of them appear at the hearing.

The most significant fact, however, is found in the advertisements. That people in Vineland, which is shown to be a city of about 20,000 inhabitants, especially poultry raisers, knew of the Gawiler device before Rudolph began to manufacture them in quantities, is apparent from the communications which passed. It is not unreasonable to assume that Miller or Rudolph or his brother might have obtained this information, although they deny it. Two different people in the town desired to be agents, which indicates a considerable knowledge in that vicinity, of Gawiler's device. When Gawiler prepared his advertising material, he procured some drawings to be made in the State of Washington, and sent out these leaflets. On the interior was a representation of the rump and vent of a hen, with a shield attached by means of a safety pin. It is not an accurate drawing, and is quite rude. However, when in a short time thereafter Rudolph issued a similar leaflet, it was of exactly the same size, folded in the same manner, and contained upon the interior a practical duplicate of the rump and shield in the interior of Gawiler's pamphlet. Even the arrows which point to certain points of the device are drawn in the same manner, with the same curves, and every feather and shading is made in the same manner. The only difference is that the Rudolph shield is somewhat differently shaped and contains his name and "patent pending." On one of the outer pages of the pamphlet appears in each case the representation of a chicken with a shield attached. They are exactly identical, with the exception of four small ventilator holes which appear in the shield on the Rudolph leaflet. The comb of the fowl, each feather, each shading, the conformation of the ground, the representation of the foliage thereon, and each shading of the feathers is exactly the same in each case. There can be no doubt, under any circumstances, upon comparing these two cuts, that they were made from the same drawing, by the same person. Yet Rudolph and his witnesses testify that they were made by independent artists from suggestions made by him and his brother. The original cuts or drawings are not in evidence, and no attempt was made to bring the original artist who prepared the Rudolph cuts, although he was available, and his address was given.

We agree with the conclusion of the Patent Office tribunals, and the decision of the Board of Appeals is affirmed.

Affirmed.

HATFIELD, *J.*, did not participate in this case.

U. S. Court of Customs and Patent Appeals

IN RE ALLEN

No. 3,772. Decided March 29, 1937

[88 F.(2d) 705]

PATENTABILITY—HIGH SPEED CUTTING TOOL.

Claims for a high speed cutting tool made of a steel alloy having certain specified constituents *Held* unpatentable since there was ample suggestion in the prior art that this particular material might be profitably used in making such a tool.

APPEAL from the Patent Office. Affirmed.

Mr. William A. Smith, Jr., *Mr. Dexter N. Shaw*, and *Mr. Charles H. Howson* for Allen.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

BLAND, *J.*:

Henry B. Allen filed his application in the United States Patent Office for a patent relating to a cutting tool for high speed cutting of non-metallic materials. The Primary Examiner finally rejected claims 1 and 2 which are the only claims in the application. They read as follows:

1. A cutting tool for high speed rotary cutting of non-metallic materials composed of a steel of the high-carbon, high-chrome type whose analysis falls within the following limits: carbon 1.50% to 2.25%, manganese .20% to .60%, silicon .10% to .40%, chromium 11.50% to 13%, sulphur maximum .40%, phosphorous maximum .040%, balance substantially all iron.

2. A cutting tool for high speed rotary cutting of non-metallic materials composed of a steel of the high-carbon, high-chrome type having substantially the following analysis: carbon 1.75%–1.85%, manganese .25%–.35%, silicon .20%–.30%, chromium 12.0%–12.5%, sulphur maximum 40%, phosphorous maximum .40%, balance substantially all iron.

The references relied upon by the Examiner were: Comstock, 1,815,613, July 21, 1931; Comstock, 1,695,916, December 18, 1928; Gill, 1,727,282, September 3, 1929.

Upon appeal to the Board of Appeals, the decision of the Examiner rejecting the claims was affirmed for substantially the same reasons as those assigned by the Examiner. The references were not discussed at length by either tribunal. Certain features of the Comstock patents were referred to and discussed by the Board. Owing to the admissions made by appellant hereinafter referred to, it appears obvious that no detailed consideration of the references, except possibly certain features of the Comstock reference, 1,815,613, need be indulged here.

In describing his invention relating to the cutting tool for high speed cutting of non-metallic materials, appellant, in his brief, states:

The cutting tool for the high speed rotary cutting of non-metallic materials of appellant's invention is composed of a steel of the high-carbon, high-chrome type in which there is present carbon from 1.50% to 2.25% and chromium from 11.5% to 13% with small amounts of the usual elements of steel in addition to the iron which makes up the balance of the product (Rec. p. 5).

Appellant makes no claim to the steel, per se, and points out in his affidavit (Rec. p. 19) that it has been known for at least thirty years, and has been personally known to him since 1913. Although the steel composition was very old, it had never been used *in a cutting tool for any purpose*. In fact, the steel was known to have no utility in a cutting tool for metals (infra pp. 14–15). Its use had been limited to wire drawing and roller threading dies, and punches for metal, where an entirely different type of action is encountered. In these uses there is merely a displacement of the metal caused by exertion of pressure, in contradistinction to the removal of chips and the like by the sharp edge of the tool and the relative movement between the cutting element and the material being cut (Rec. p. 19, par. 4). These facts are evidence of appellant's claim to invention. * * *.

The benefits which he claims flow from his invention are: First, his cutting tool when used on non-metallic materials may be used three times longer than prior art cutting tools. Second, his cutting tool is tougher than cutting tools previously known, and breakage is thereby reduced to a minimum. Third, his cutting tool is less expensive both from a standpoint of material and manufacturing cost. Fourth, the operations in hardening and tempering his cutting tool may be performed at much lower temperatures than if high speed alloy tool steels were used.

The Patent Office tribunals, after stating that the steel used by appellant was old in the art of tool making, pointed out that appellant's claimed invention rests solely upon finding a new use for an old material and that it did not require invention to put the old material to the new use of making tools for cutting non-metallic substances such as synthetic resin products.

Appellant frankly admits that the prior cited art shows that a steel such as he uses was old in the art of making punches, dies, etc. He states he made no claim to the steel per se because this steel had been known for at least thirty years and personally known to him since 1913, but asserts that it had never been used in a cutting tool. Appellant also contends that, prior to his discovery, a tool of this character had been proven to be unsatisfactory when used for cutting metals and that this fact would ordinarily be calculated to induce those skilled in the art to believe that it could not be satisfactorily used in tools for cutting non-metallic substances.

In affirming the action of the Primary Examiner in denying the claims, the Board said:

As a general rule, the mere substitution of one old and well known material for another is not a matter of invention, even though the substitution leads to the production of a superior article. In some cases, where the new use involves new properties of the materials, the act of substitution has been held to amount to invention. Although the appellant admits that the steel used by him is old in the art, the references cited by the Examiner require consideration to determine whether or not the properties of this material were such as to lead one to believe that it might be useful as a material from which cutting tools for non-metallic materials might be made.

Considering the difficulty involved, one would expect any steel having considerable hardness, and known to be resistant to wear, worthy of trial. The Comstock patent, 1,815,613, says of high-carbon, high-chrome steels that they, like the manganese steels, have a high resistance to abrasion. Comstock also says that products resulting from their use may be hardened in air, oil or water. While the steels discussed by Comstock went into the production of cutting tools, designed for high-speed work, the steel itself was used as a binder for tungsten carbide, the latter being present in quantities up to 95% in some instances.

The second Comstock patent, in discussing a similar steel, again mentions its high resistance to abrasion. It also speaks of the characteristic of hardness. In patent 1,695,916, Comstock was particularly concerned in producing a steel having the general characteristics of high-carbon, high-chrome steel but with a slightly lower carbon content to permit annealing, and hence subsequent machining. Comstock contemplated using this steel for dies such as are used to form the sheet metal parts of automobile bodies. On page 3 of the patent, Comstock says:

"The steel has a very high resistance to abrasion and is therefore particularly adapted for dies and punches, although the steel may be used for other purposes."

Again he says:

"It should be understood that the steel may be used for other purposes, particularly where great hardness and resistance to abrasion are desired in the finished article, combined with easy machining of the annealed material."

From the matter quoted it seems to us that one desiring a material for tools likely to become dulled by abrasion would see in the material discussed by Comstock one suitable for his particular purpose. We are unable to see that the selection of material involved in this application required the exercise of invention.

It seems to us that the question involved is whether or not, under the circumstances of this case, there was invention involved in putting the old material to a new use. As a general proposition of law, the mere substitution of materials is unpatentable. *In re Schoenrock*, 19 C. C. P. A. (Patents) 1268, 59 F.(2d) 235, 424 O. G. 329; *In re Fischer*, 20 C. C. P. A. (Patents) 708, 62 F.(2d) 96, 427 O. G. 261. To this rule there are exceptions. Sometimes the exception rests upon the proposition that the known use of the old material was in an art so far removed from that of the new use as to be wholly nonanalogous and not suggestive of the new use. *In re Covey*, 20 C. C. P. A. (Patents) 962, 63 F.(2d) 982, 432 O. G. 756. The exception also may rest in the novel use of the article producing a result different in kind. *Smith* v. *Goodyear et al.*, 93 U. S. 486, 11 O. G. 246. The decisions, however, seem to be uniform on the proposition that where the new use of the old material merely brings about beneficial results differing only in degree, invention is not present. In the instant case, the prior art showed that it was old to use appellant's material in making punches, which are metal tools. It is true that a punch is not a high speed cutter, but the principle of resistance to abrasion is involved in both instances. Appellant's claimed invention is said to rest largely upon the fact that in his use of the old material there is much less abrasion than in other known uses. Comstock, 1,815,613, not only shows what the Board stated it shows, but in a specific example given (Example I) states:

A specific example of a composition suitable for use in the production of tools, such as drawing dies, extrusion dies, high speed cutting tools, such as bits, shapers, drills, cutters, saws, and the like, is as follows:

Tungsten carbide, 87.00%, 13.00% of a manganese steel as herein referred to.

It seems to us that there is ample suggestion in the prior art cited, which is not sufficiently nonanalogous to be barred from consideration, to suggest to one skilled in making cutting tools that the old material might be profitably used in the art of making a high speed cutting tool for use on such materials as resins, and that appellant, in what he has done, has exercised no more than the mechanical skill of one experienced in the art.

We do not think it necessary to discuss in detail the cases relied upon by the appellant. In each of the cases relied upon, where there was a substitution material depended upon for patentability, there were facts which are not disclosed in the record at bar. Pertinent to our position in the instant case, we think, are the following decisions: *In re Lawrence Byck*, 18 C. C. P. A. (Patents) 1208, 48 F.(2d) 665, 410 O. G. 284; *In re John Wesley Marden*, 18

C. C. P. A. (Patents) 1046, 47 F.(2d) 957, 409 O. G. 559; *In re Heap*, 22 C. C. P. A. (Patents) 950, 74 F.(2d) 948, 456 O. G. 265; and *In re Neuberth*, 23 C. C. P. A. (Patents) 1070, 82 F.(2d) 718, 470 O. G. 720.

The decision of the Board of Appeals is affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

IN RE MCFERRAN

No. 3,780. Decided March 29, 1937

[88 F.(2d) 701]

PATENTABILITY—MOTOR DRIVEN FOOD CHURNING DEVICE. Claims for a motor driven food churning device to be placed inside a mechanical refrigerator *Held* patentable over the prior art.

APPEAL from the Patent Office. Reversed.

Mr. Arthur F. Robert and *Mr. Joseph W. Milburn* for McFerran.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

BLAND, *J.*:

Claims 1, 17, 18 and 19, being all the claims on appeal, of appellant's application for motor driven food churning devices, were rejected by the Primary Examiner of the United States Patent Office, no claims being allowed. Upon appeal to the Board of Appeals, the decision of the Examiner was affirmed, and appeal has been taken here for review of the decision of the Board.

Appellant's device is a unit to be placed in the freezing compartment of a household mechanical refrigerator after the usual ice cube pans are removed. The unit consists of a receptacle having a stirrer for the ice cream. It is necessary to stir the cream so that the texture will be smooth. The stirrer is driven by an electric motor which is attached to the stirring receptacle and is also inserted into the freezing compartment. The means connecting the motor to the receptacle consists of a pair of arms which, at the ends connected with the receptacle, are downwardly turned in order to fit into lugs on the receptacle. The invention consists in so insulating the connecting parts between the motor and the receptacle that heat generated from the motor will not retard the freezing of the contents of the receptacle. This means consists, first, in insulating liners between the lugs of the downward extensions from said arms in order to prevent transfer of heat from the motor to the receptacle through the arms, and, second, in insulating the supports for the motor in order that the heat from the same will not pass through the bottom of the compartment and into the receptacle.

Claim 18 is regarded as illustrative and reads:

> 18. A food churning device of the class described comprising a churning vessel having a dasher, a motor arranged adjacent to said vessel in driving relation with said dasher and connecting means securing the motor and the vessel together as a unit which is adapted for insertion into the freezing compartment of a mechanical refrigerator, said connecting means including insulated portions of low heat conductivity which substantially limit the direct transfer of heat from the motor to the vessel.

The references relied upon are: Simmons et al., 1,763,567, June 10, 1930; Lindsey, 1,936,723, November 28, 1933.

The patent to Simmons et al. is for a freezing unit much like that of the applicant, except for the alleged invention, and which unit is placed in the freezing compartment of a mechanical refrigerator. It has a stirrer and a motor and all the elements of appellant's structure except the insulating means for preventing the heat being conducted from the motor to the freezing receptacle. This fact is conceded by all.

The patent to Lindsey discloses a freezing receptacle inside the freezing compartment of an ordinary mechanical refrigerator to which is attached a motor which drives the stirring element in the receptacle, which motor is placed on the outside of the refrigerator, either on the wall or the door, preferably the door, with the insulated door between the motor and the refrigerating compartment of the refrigerator. Lindsey states, among other things, that the object of his invention is

> "to provide a freezer whose driving motor is located outside of the refrigerator so that its heat will not tend to raise the temperature of the refrigerating chamber or that of the refrigerator unit."

The Examiner and the Board of Appeals were of the opinion that it would not constitute invention over the disclosure of the device in Simmons et al. to provide insulation in the connecting means between the motor and the receptacle in view of the disclosure of Lindsey who had placed his motor on the outside of the refrigerator. This holding is the sole ground of rejection of the appealed claims and presents the sole question here for decision.

It is shown in the record that in devices like that of Simmons et al., for some reason not understood prior to appellant's invention, heat from the motor unit would find its way into the freezing chamber and retard, if not prevent, freezing of the contents of the receptacle. According to the record, whether the heat was deflected from the motor or conducted through certain connecting parts had not been determined prior to appellant's invention. Appellant discovered by experimentation that the objectionable heat was inducted from the motor to the walls of the receptacle through the rigid means for connecting the motor to the receptacle or at least he discovered that when the effect of said inducted heat was avoided, the problem was solved. Instead of taking the motor out of the refrigerator, as did Lindsey, he conceived the notion of insulating the rigid connecting means so that the heat would not be conducted from the walls of the motor enclosure to the walls of the receptacle. Upon constructing a device as aforesaid, he discovered that the device worked properly and that the contents of the receptacle would promptly freeze and that the difficulties encountered with prior art structures had been overcome. Affidavits to this effect were submitted and considered by the tribunals below.

It was the view of the tribunals that Lindsey had solved the same problem. We are of the opinion that Lindsey's solution of the heat problem was wholly different from that of appellant. Appellant's structure is unitary. When not needed, it can be taken out and laid aside. No cumbersome motor on the door of the refrigerator is encountered. A successful unitary plant was sought by Simmons et al. Lindsey did not produce such a structure, but appellant did. It is not thought that placing the motor outside the refrigerator and thus avoiding the heat problem would suggest to anyone that the heat was necessarily conducted through the connecting arms and wall portions of the structure nor would it suggest that insulating these portions would solve the difficulty. Lindsey would have solved the heat problem by placing the motor in a position entirely away from the refrigerator. The fact that there was insulation in the door of the refrigerator of Lindsey would hardly suggest that the small amount of insulation employed by appellant at the critical points, having discovered that the undesirable heat resulted from induction rather than reflection, would likewise solve the problem.

We think appellant has greatly contributed to the art in question, and that indubitably there is enough doubt on the question as to whether or not his contribution required the exercise of the inventive faculty to require application of the usual rule that such doubt should be resolved in favor of the applicant. Under the circumstances, therefore, we are of the opinion that the appealed claims should have been allowed.

The decision of the Board of Appeals is reversed.

Reversed.

HATFIELD, *J.*, did not participate in this decision.

U. S. Court of Customs and Patent Appeals

IN RE BERTRAM

No. 3,784. Decided March 29, 1937

[88 F.(2d) 834]

PATENTABILITY—PUBLIC USE.

> Where a machine for cutting a concave surface on the topmost or attaching face of a shoe heel was demonstrated to possible purchasers by manufacturing heels with such a surface and contracts for sale of machines were made *Held* that this demonstration constituted a public use and as such use was more than two years prior to the filing of the B. application, the appealed claims were properly rejected.

APPEAL from the Patent Office. Affirmed.

Mr. Thomas E. Robertson and *Mr. A. D. Salinger* for Bertram.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

BLAND, *J.*:

The instant appeal, according to the reasons of appeal, is from two decisions of the Board of Appeals of the United States Patent Office, affirming the decisions of the Primary Examiner, the first of which held that the subject matter of the claims was in public use and on sale more than two years prior to the filing of the application, and the second finally rejected thirteen claims of the Bertram application, filed May 14, 1931, for a wood heel-making machine. The rejection was solely on the ground that the subject matter of the claims had been in public use and also on sale more than two years prior to the filing of the Bertram application.

Bertram, as junior party, had been in an interference proceeding in the Patent Office with Walter C. Brooks and John W. Staples. The Brooks and Staples application had been filed October 7, 1929. Ten of the thirteen claims at bar were there involved. Priority of invention was awarded to Bertram, and Brooks and Staples did not appeal. Subsequently, a public use proceeding was instituted against Bertram for the reason that the proofs presented by Brooks and Staples in the interference proceedings were believed to show prima facie that the invention defined in the Bertram claims was in public use and on sale in the United States for more than two years prior to Bertram's filing date. Further proofs were taken. The Primary Examiner then held that the Brooks and Staples activities established both a case of "public use" and a case of "on sale" against Bertram. Upon appeal, the Board of Appeals affirmed this decision. Thereafter, the Primary Examiner, *ex parte*, finally rejected the thirteen claims here involved, and his decision was affirmed by the Board for the reasons stated in its decision in the public use proceeding.

Attention is here called to the fact that the critical date from which the two year period started to run is May 14, 1929.

The invention involved in the interference and that defined by the claims at bar relates to a machine for cutting a concave surface on the topmost or attaching face of a shoe heel. In prior practice, this operation had been carried out by hand or by the use of machinery which did not give satisfactory results. Since there is no question about the nature of the invention, it will not be necessary to quote the claims or further discuss the features of the machine involved in appellant's application or the one which is alleged to have been used by Brooks and Staples more than two years prior to the filing date of Bertram.

There was much testimony taken in the two proceedings referred to, but it is agreed that there is little, if any, conflict in the testimony and that there is no issue raised as to what the testimony shows. The sole question presented is one of law and involves only the ascertainment of whether or not the activities of Brooks and Staples prior to the Bertram filing date show a "public use" or "on sale" for more than two years prior to May 14, 1931, within the meaning of section 4886 of the Revised Statutes, the pertinent provisions of which may be presented in the following deleted form:

> Sec. 4886. [U. S. C., title 35, sec. 31.] Any person who has invented or discovered any new and useful * * * machine * * * not in public use or on sale in this country for more than two years prior to his application * * * may * * * obtain a patent therefor.

In view of our conclusion, it will not be necessary for us to consider the question as to whether or not the record shows that the invention was "on sale" prior to the critical date except insofar as such evidence may have a bearing upon the question

which we are here called upon to decide, to wit, was the invention in "public use" for more than two years prior to the filing of the Bertram application.

The testimony, we think, clearly establishes the fact that the machine of Brooks and Staples as it existed and as it was operated prior to the critical period was a completed invention. It performed the functions for which it was intended and we do not regard it as important to consider minor improvements which might have been made subsequently. The new improved machine before the critical date was successfully operated in producing a new and novel result in the manufacture of shoe heels for which it was designed, and for the purpose of demonstrating that it was a completed and saleable invention. It had clearly passed the experimental stage.

The demonstrations, made by Brooks and Staples, were made to people who were invited to see the machine and its operation for the purpose of inducing such persons to enter into contracts of sale of machines like the one operated which were thereafter to be built. There was no pledge of secrecy and the exhibitions were not private or secret and may be regarded as public in character. As a result of the demonstrations and the negotiations between Brooks and Staples and prospective purchasers, two contracts of sale were made before the critical date. It is stated that delivery was not made until long after the critical period and that prior to the critical period Brooks and Staples had no machine except the one operated which could have been sold. The record shows that in both instances part payments by the machines' purchasers were made. One of the sales contracts was in writing and the other verbal. One of the prospective purchasers brought with him a basket of blank shoe heels. These were operated upon in his presence to his entire satisfaction and at that time he entered into a contract to purchase a machine and partly paid for the same. The record is not clear what final disposition was made of the heels so operated upon and, under the circumstances of this case, we do not regard this fact as important. The record abundantly supports the conclusion that the demonstration was not made for the purpose of discovering or curing defects in the machine or to experiment with the view of further improving the same. The demonstrations were made by Brooks and Staples, who were machine builders and not dealers in shoes or shoe heels, in that line of their business which involved the sale of the machines they made.

The Board of Appeals, in affirming the decision of the Primary Examiner in rejecting appellant's claims directed attention to the reasons stated in its decision in the said interference proceeding.

Concerning the contentions of the appellant and the Board's view of the law applicable to the facts in this case, the Board said:

> Appellant has argued at considerable length and cited numerous cases in support of his contention that a test use for purposes of reduction to practice is not a public use and as we are thoroughly in accord with this view, it is unnecessary, we believe, to enter into a discussion of this aspect of the situation. While the Examiner relied upon the demonstration during which orders were taken as a completion of the reduction to practice, it is entirely possible that the party Brooks and Staples had completed a reduction at an earlier date. However, whether this be true is not deemed material as there appears to be no dispute but that the so-called experimental machine was demonstrated before prospective customers and that orders were taken to build a similar machine. There also appears to be no dispute but that the demonstration machine was capable of performing its intended function and that, while it perhaps was not in perfected condition, it probably could have been sold and was capable of use to concave heels which could have been employed commercially.
>
> We have carefully considered the decisions relied upon by the parties and while there may be some dicta which may be argued as pertinent to this situation, we have been unable to discover any decision where the facts are the same.
>
> It is our view that, even if the operation relied upon to establish public use must also be relied upon for a reduction to practice, just as soon as the party demonstrating or testing the machine offered to take orders for similar machines, it is to be presumed that the operation ceased to be merely experimental or for reduction to practice purposes and became use of another nature. Where a use is public, it is believed that the law regards it either as experimental or public use as we know of no authority for a third use, to be regarded as a "demonstration use", and which is neither of the other two.
>
> Perhaps the following excerpt from the decision, *Smith & Griggs Mfg. Co.* v. *Sprague*, 123, U. S. 249, referred to in appellant's brief, is the clearest statement of the law:
>
> "A use by the inventor, for the purpose of testing the machine, in order by experiment to devise additional means for perfecting the success of its operation, is admissible; and where as incident to such use, the product of its operation is disposed of by sale, such profit from its use does not change its character; but where the use is mainly for the purposes of trade and profit, and the experiment is merely incidental to that, the principal and not the incident must give character to the use. The thing implied as excepted out of the prohibition of the statute is a use which may be properly characterized as substantially for purposes of experiment."
>
> We believe in this instance that the demonstration was mainly for purposes of trade and profit and that it constituted a bar to the grant of a patent to appellant.

The chief contention of appellant is, we think, embodied in the following quotation from his brief:

> • • • the unquestionable fact stands out most clearly that so far as concerns any so-called "use" that was made of said machine, *such "use" was purely and wholly experimental*, as distinguished from a commercial or substantial use such as would constitute a bar within the meaning of the two years' public use provision of the statute and the decisions pertaining thereto. In fact, it is overstating the matter to call what was done with this machine at that time a "use" of any kind, for the sporadic operation of the machine was not for the purpose of *using* it, in any proper sense, the machine having been operated merely for test purposes and to show others how it worked.
>
> • • • • • • •
>
> Undeniably the operation of this machine to concave a few heels was merely for the purpose of showing interested parties how the machine worked, and there was no question of "trade and profit" with respect to that particular machine, or with respect to the operation thereof, or the product produced by that operation. Clearly, the mere fact that Brooks and Staples, by means of such operation of the machine, hoped to, and actually did, induce some heel manufacturers to place orders for similar but improved machines to be subsequently built, does not in any way change the character of such operation of the machine, or transform what was plainly a mere exhibition and demonstration of the machine into a "use" within the public use provision of the statute.

It will be noticed that the appellant contends that a demonstration use, such as that now under consideration, is not a use within the meaning of the statute. We have carefully read all the authorities cited and many others and we cannot conclude that the Board was in error when it stated:

> "Where a use is public, it is believed that the law regards it either as experimental or public use as we know of no authority for a third use, to be regarded as a 'demonstration use', and which is neither of the other two."

The demonstration use for the purpose of making sales under the circumstances such as prevailed here, implies that the invention had been completed by reduction to practice and that the use was not for the purpose of improving the machine so as to complete the invention. We think that it was a use in the business of the users. It was a use in which the public became advised of the utility of the invention at a period more than two years before Bertram asked for his reward.

While there are no authorities which involve the exact state of facts or the exact question of law here under consideration, there are pertinent authorities which, in principle, suggest the correctness of the decision of the Board. Questions involving the public use of an invention have been before the courts of this country on many occasions during the last hundred years. In *Shaw* v. *Cooper*, 7 Pet. *292, *322, the court said:

> A strict construction of the act, as regards the public use of an invention, before it is presented, is not only required by its letter and spirit, but also by sound policy. A term of fourteen years was deemed sufficient for the enjoyment of an exclusive right of an invention by the inventor; but if he may delay an application for his patent, at pleasure, although his invention be carried into public use, he may extend the period beyond what the law intended to give him. • • •

A later decision, and the most pertinent one we have found, was cited by the Board of Appeals—*Smith & Griggs Manufacturing Company* v. *Sprague*, 123 U. S. 249, 41 O. G. 1037. While that case involved a use of an invented machine for the manufacture of the goods which appellee sold in his established business, it was concerned directly with the question as to whether or not the use was experimental. In discussing this use, the court said:

> • • • And if, without the use of the combinations contained in the excluded claims, the complainant had a machine practically useful for the purpose for which it was designed, which could be used with commercial success as superior to modes of manufacture previously in use, and which, in fact, he did so use for profit in the ordinary course and conduct of his business, and for the purpose of a successful prosecution of that business, it can hardly be said with propriety that such use was merely experimental, although during the period of its operation he was also engaged in the invention of improvements by which he hoped and expected to make it more valuable and useful.
>
> A use by the inventor, for the purpose of testing the machine, in order by experiment to devise additional means for perfecting the success of its operation, is admissible; and where, as incident to such use, the product of its operation is disposed of by sale, such profit from its use does not change its character; but where the use is mainly for the purposes of trade and profit, and the experiment is merely incidental to that, the principal and not the incident must give character to the use. *The thing implied as excepted out of the prohibition of the statute is a use which may be properly characterized as substantially for purposes of experiment. Where the substantial use is not for that purpose, but is otherwise public, and for more than two years prior to the application, it comes within the prohibition.* • • • [Italics ours.]

We have italicized certain very significant language which, in substance, says that if there is a substantial use not for the purpose of experimentation, such use falls within the prohibition. It is true that in that case the use was said to be "mainly for the purposes of trade and profit." The Board concluded that the demonstration use here under consideration was mainly for purposes of trade and profit. Without holding that, under the circumstances of this case, the question of trade and profit is a controlling one, we may say that we know of no other motive which Brooks and Staples might have had in demonstrating the machine. It certainly resulted in trade, and presumably resulted in profit. It is true that the said operation of the machine did not (as far as the unquestioned statement of facts shows) produce goods from the handling of which trade and profit flowed, but the machine was operated for the only purpose for which it was intended and trade and profit resulted from such operation.

In view of our conclusion as to public use it is not necessary for us to consider the question as to whether or not the invention was on sale prior to the critical date.

We are in agreement with the conclusion of the Board of Appeals that the record discloses that the invention defined by the claims was in public use for more than two years prior to the application within the meaning of the statute, and that the decision of the Board, affirming that of the Examiner, in rejecting said claims was correct, and should be, and it is, affirmed.

Affirmed.

U. S. Court of Customs and Patent Appeals

MOTLOW *v.* OLDETYME DISTILLERS, INC.

No. 3,774. Decided March 29, 1937

[88 F.(2d) 732]

TRADE-MARKS—USE OF MARK—MUST BE BEFORE APPLICATION.

Under the provisions of the Trade-Mark Act of 1905, a trade-mark may not be registered if it was not in use by the applicant when his application was filed.

APPEAL from the Patent Office. Affirmed.

Mr. Chauncey P. Carter for Motlow.

Mr. Herbert J. Jacobi, *Mr. William J. Jacobi*, and *Mr. George C. Baldt* for Oldetyme Distillers, Inc.

LENROOT, *J.*:

This is a trade-mark opposition proceeding wherein the Commissioner of Patents reversed a decision of the Examiner of Trade-Mark Interferences dismissing the opposition of appellee, and held that appellant was not entitled to the registration of the trade-mark for which he made application.

On July 19, 1933, appellant filed application under the Trade-Mark Act of February 20, 1905, for the registration of a composite trade-mark for whiskey, one feature of which mark consisted of the words "Old Time Distillery." The application states:

> The trade-mark is applied and "affixed" to the goods by printing, engraving or lithographing the same on labels that are fastened to the containers and has been used in the business now owned by the applicant in connection with the goods named herein since 1905.

On July 12, 1934, appellee filed notice of opposition, alleging that it was incorporated under the laws of the State of New Jersey on or about December 19, 1933; that the dominant part of appellant's mark is the words "Old Time Distillery"; that said words are substantially identical with opposer's (appellee's) corporate title, and therefore registra-

tion of said mark should be refused under the provisions of said trade-mark act.

Appellee in its notice of opposition also alleged:

10. That as your petitioner is informed and believes and therefore charges, the applicant herein is not the owner of the trade-mark sought to be registered; that the mark sought to be registered was abandoned by the original owner thereof and no assignment of such mark given to the applicant herein; that the applicant is not entitled to claim use of the mark sought to be registered since 1905 since he is not the legitimate assignee of the original owner of the trade-mark; that as applicant is informed and believes and, therefore, charges, the applicant was not engaged in the manufacture, rectification and/or sale of whiskey at the date of the filing of the application for registration of the mark sought to be registered; that applicant did not have use of the mark sought to be registered at the date of the application for registration thereof; that applicant is not now engaged in the manufacture, rectification and/or sale of whiskey bearing the trade-mark sought to be registered and has no license to manufacture, rectify and/or sell whiskey, so that registration should be refused applicant on the mark sought to be registered.

Other allegations respecting confusion in trade and damage to appellee were made, not necessary to be considered upon this appeal. Appellant filed an answer to the notice of opposition, the eighth paragraph of which reads as follows:

Applicant admits that he was not actually manufacturing, rectifying and/or selling whiskey on the date on which he filed this application for registration, but avers that he now has a Federal license to engage in such business, and is preparing to do so, and applicant denies all other allegations of paragraph 10 of the Notice of Opposition. Applicant further avers that he has personally used the trade-mark applied for long prior to opposer's alleged incorporation, and has never abandoned the same.

No testimony was taken and final hearing was had before the Examiner of Trade-Mark Interferences upon the pleadings, and the notice of opposition was dismissed upon the ground that appellee was not in existence at the time of the filing of appellant's application, and therefore appellee had no standing to oppose appellant's application upon the ground that a part of appellant's mark was the corporate name of appellee, and was not entitled to invoke the name clause of section 5 of said Trade-Mark Act.

Upon appeal to the Commissioner, he agreed with the Examiner of Trade-Mark Interferences that appellee had no right to oppose the registration of appellant's mark upon the ground that it comprises substantially appellee's corporate name, inasmuch as the date of incorporation of appellee was subsequent to the filing date of appellant's application. He further held, however, that appellant was not using the mark applied for in commerce at the time of filing his application, and for that reason he reversed the decision of the Examiner of Trade-Mark Interferences and adjudged that appellant was not entitled to the registration of the mark applied for.

Appellant thereupon took the appeal which is now before us. Two questions are presented for our consideration:

1. Does the record disclose a non-use of appellant's mark by him at the time of the filing of his application?

2. If the first question be answered in the affirmative, does the fact that the National Prohibition Act and the Eighteenth Amendment to the Constitution were in force at the time appellant's application was filed, and for more than fourteen years prior thereto, preventing him from manufacturing or selling whiskey to which he could apply the mark, enable him to claim use of the mark at the time of filing his application, appellant having used the mark in commerce prior to January 29, 1919, the date said amendment was ratified?

We think the admission in appellant's answer, dated October 12, 1934, that he was not actually manufacturing, rectifying, and/or selling whiskey on the date on which he filed his application for registration, but on October 12, 1934, had a license so to do and was "preparing to do so," should be construed as an admission that at the time of filing his application appellant did not have such license and that appellant's mark was not used in commerce at the time of filing his application.

In appellant's brief the following statement is found:

It so happens that appellant was debarred from using his mark for more than a decade by Federal and State prohibition. • • •

This statement is in accord with the construction we have given to the admission in appellant's answer to the notice of opposition hereinbefore quoted.

With respect to the second question above stated, we are of opinion that, regardless of appellant's legal ownership of the mark, which we do not question, in order to secure registration of the same he must have been using the same in interstate commerce at, or shortly prior to, the filing date of his application. Section 2 of the Trade-Mark Act of February 20, 1905, requires an applicant to declare at the time of filing his application "that such trade-mark *is* used in commerce among the several States," etc. [Italics ours.] It will be noted that the present tense is used, and not the words "has been used." This clearly requires a present use, and while, of course, shipment of goods with the mark applied is not required upon the exact date that the application is made, the use, within the meaning of the statute, cannot relate back fourteen years to some previous use of the mark. The right to register is wholly statutory, and while appellant's trade-mark may be valid at common law, he is not given the right to register the same unless the provisions of the statute are complied with.

This may be unfortunate for appellant, but in order to relieve him it is not within our province to legislate, but only to construe legislation under which he seeks registration. Appellant has pointed out the great injustice that he may suffer should his application be rejected, and suggests that appellee may now successfully oppose a new application of appellant under the name clause of the statute. Whether this be true or not is a question that is not before us.

For the reasons stated, the decision of the Commissioner, insofar as it holds that appellant is not entitled to the registration applied for, is affirmed.

Affirmed.

GARRETT, *J.*, did not participate in this decision.

U. S. Court of Customs and Patent Appeals

IN RE SEEBACH

No. 3,781. Decided March 29, 1937

[88 F.(2d) 722]

PATENTABILITY—MOLDED ARTICLE AND PROCESS OF MAKING—INTERFERENCE ON COPENDING APPLICATION.

Claims for a molded article and claims for the process of making it *Held* properly rejected as not patentably distinct from the claim constituting the issue of an interference involving another application of appellant.

APPEAL from the Patent Office. Affirmed.

Mr. Jos. N. Nielsen, Mr. Charles H. Potter, and *Mr. Harold T. Stowell* for Seebach.

Mr. R. F. Whitehead and *Mr. Howard S. Miller* for the Commissioner of Patents.

LENROOT, *J.:*

This is an appeal from a decision of the Board of Appeals of the United States Patent Office, affirming a decision of the Examiner rejecting claims 17 to 22, inclusive, of appellant's application for patent as not patentably distinct from certain counts of an interference, which are claims of another application of appellant, of which the application before us is a division. No claims were allowed.

Claims 17 and 22 are illustrative of the claims before us and read as follows:

17. Method of preparing molded objects from a phenol-aldehyde resin of the heat-hardenable type and an air-drying fatty oil as a binder which comprises forming a homogeneous composition of the heat-hardenable resin with the oil in an oxidized condition, mixing a filler with the composition, and molding the product with the application of heat to cause hardening of the binder.

22. As a new article of manufacture a molded body having as a binder a product comprising a phenol-aldehyde resin of the heat hardening type in homogeneous composition with an air-drying oil having an oxidized component.

The references cited, in conjunction with the above-mentioned interference, No. 68,601, are as follows: Ellis, 1,541,336, June 9, 1925; Coleman et al., 1,808,529, June 2, 1931; Brown, 1,212,738, January 16, 1917.

The application relates to the production of molded articles and the subject matter is sufficiently described in the above quoted claims.

The counts of said interference relied upon read as follows:

1. Process of preparing compositions which comprises mixing a hardenable phenol-aldehyde condensation product with an oxidized air-drying fatty oil in a solvent for both components and thereafter removing the solvent.

2. As a composition of matter suitable for coatings a product comprising a hardenable phenol-aldehyde condensation product and an oxidized air-drying fatty oil incorporated therewith.

The reference patents are described in the decision of the Board as follows:

• • • Broadly, Ellis discloses a composition of rosin, phthalic anhydride and glycerol dissolved in a solvent and mixed with a small amount of drying oil and filler may be molded. This relates to a different type of resin and apparently only a small amount of the drying oil in the raw state.

Coleman coats particles of filler with a coating of drying or semi-drying oils or bituminous material whereupon the film becomes dried. This coated filler is mixed with a phenolic condensation product moistened with a solvent in order to prepare a molding powder.

Brown claims to produce a mixture of phenolic resins and drying oil by mixing the oil with the constituents for producing a phenolic condensation product and allowing the complete reaction to proceed.

With respect to said patent references and the reference counts involved, which latter are claims in appellant's parent application, the Board stated:

The citations do not appear to anticipate the claims on appeal considering applicant's specific disclosure and reasons therefor, but the Examiner holds that these citations referring broadly to making molding compositions out of somewhat similar materials taken with the claims which have been held allowable in the parent application of which this case is a division, constitute a reference against the allowance of such claims in this case.

The claims referred to in the parent case relate to producing a mixture of phenolic resin and drying oils by the particular method of employing previously oxidized oil and resin in a common solvent and the product, but the claims in the parent case do not relate to such material as a binder in making molding compositions but rather relate to making such combination for use in the lacquer and varnish arts. • • •

The Board expressed the view that, inasmuch as the interference counts embraced the same resinous materials as are embraced in the claims before us, and as the patent references disclose that binders of the same general type as those disclosed in said claims may be used for molding purposes, the claims are not patentable over said counts of the interference in view of the patent references.

We think the Board came to the right conclusion, although as we view it, its holding is tantamount to a decision that the requirement for division of the parent application was improper. This we shall later discuss herein.

It is clear that for the claims in the divisional application before us to be patentable therein, they must be patentably distinct from the claims of the parent application which are now in interference. Appellant concedes this, and contends that they are so patentably distinct.

We think the only novelty in the claims before us lies in the resin, claims for which have been allowed in the parent application and are now in interference. While it is true that the parent application relates to a composition for use in the lacquer and varnish arts, the claims in that application are not so limited, and it seems to us that any purchaser of the composition after it is patented will have the right to make any use of it that would be obvious in view of the prior art. We are of the opinion that the process of molding the material is obvious from the patent references Ellis and Coleman, where compositions of the same general character, but patentably distinct from appellant's composition, are used for molding purposes by mixing the same with a filler, and the Coleman patent discloses molding his product with the application of heat to cause hardening of the binder, which steps comprise the last elements of the claims here involved. Appellant does not claim that the mere steps of mixing a filler with a resinous composition and molding the product with the application of heat to cause hardening of the binder are in themselves inventive, but his claimed invention lies in mixing his particular composition with the filler, followed by conventional steps disclosed by the prior art.

The case of *In re Dreyfus*, 20 C. C. P. A. (Patents) 1204, 65 F.(2d) 472, 437 O. G. 7, involved certain process claims for the production of certain filaments or threads, such as artificial silk, by what was called the dry spinning of a solution of certain specified substances. In our opinion af-

firming the decision of the Board of Appeals we said:

Upon the whole, we think the fair and proper construction of the Board's decision is that the claims are rejected, in the light of the prior art cited, because processes of dry spinning are already patented to appellant and others and were known to the art, and he has added no new feature to the process of dry spinning itself by adding an additional ingredient to, or making changes of ingredients in, the solution which he spins.

In the case of *In re Byck*, 18 C. C. P. A. (Patents) 1208, 48 F.(2d) 665, 410 O. G. 284, there was involved the patentability of a certain article having a coating of a certain composition, which composition had been patented to appellant in another patent. In our opinion we said:

We think it clear that the application here in issue does not claim a separate invention from that claimed in the issued patent, but only claims an obvious use of the composition there patented. If appellant's position is well taken, then it would seem that any inventor of a new and useful composition of matter may receive a patent for it and he may also, by filing separate applications, secure patents for every use of such composition that he may disclose. An inventor is not entitled to a patent unless his invention is new and useful. • • •

For the reasons hereinbefore stated, we think the involved claims embrace only the same *invention* as is embraced in the claims of appellant's parent application, hereinbefore quoted, and now in interference.

When the Examiner rejected appellant's claims, he stated in a letter appearing in the record as follows:

This rejection may possibly be overcome if applicant prevails in the interferences in which the parent application is involved. If applicant wishes, prosecution of this application may be suspended upon request pending the outcome of the interferences. The request, however, should include a full response to this rejection.

Appellant elected, however, not to accept the suggestion of the Examiner, and proceeded with the prosecution of the claims.

The Board of Appeals, however, did not concur in the view of the Examiner, stating:

• • • It is not regarded as being material whether applicant is finally the successful or the unsuccessful party in the interference proceedings. In either case the situation as to patentability over the issue would be regarded as the same.

We agree with the view of the Board upon this point, for in order to entitle appellant to allowance of the claims in his divisional application, it must appear that they embrace a different invention from that embraced in the claims of the parent application; or, in other words, they must be patentably distinct therefrom.

That the requirement for division was improper would seem to be established from the fact that the Patent Office tribunals properly held that the claims here involved are for the same invention claimed in the parent application. However, appellant did not appeal from the Examiner's requirement of division, which he might have done, and therefore any error of the Examiner in that regard cannot be corrected in this appeal. If appellant should be awarded priority in the interference now pending, it may be that, before a patent is issued to appellant, the proper Patent Office tribunal has the discretion to take cognizance of this error and permit appellant further to prosecute the involved claims under his parent application. This, however, is not a matter before us in this appeal and we express no opinion with respect thereto.

For the reasons stated herein, the decision of the Board of Appeals is affirmed.

Affirmed.

HATFIELD, *J.*, did not participate in this decision.

Patent Suits

[Notices under sec. 4921, R. S., as amended Feb. 18, 1922]

1,148,193, Ross & McCully, Faucet; 1,196,879, Morrison & McCully, same, filed Aug. 31, 1937, D. C. Wash. (Seattle), Doc. 1195, *E. H. Shamek* v. *J. C. Ross.*

1,196,879. (See 1,148,193.)

1,262,860, S. B. Smith, Incubator, D. C. Minn., 4th Div., Doc. E 2823, *S. B. Smith* v. *E. I. Chamberlain (Evergreen Electric Hatchery)*. Dismissed Aug. 24, 1937.

1,401,499, P. B. Saugen, Carbon removing device, C. C. A., 2d Cir., Doc. —, *General Electric Co.* v. *Wabash Appliance Corp. et al.* Decree reversed (notice Aug. 25, 1937).

1,470,524, H. B. Burt, Process of making frozen confections; 1,718,997, same, Frozen confection, filed Aug. 28, 1937, D. C., E. D. N. Y., Doc. E 8352, *Good Humor Corp. of America* v. *Hershey Ice Cream Co., Inc., et al.* Doc. E 8353, *Good Humor Corp. of America* v. *Yukon Ice Cream Co., Inc., et al.*

1,483,365, J. Mazer, Sound absorbing method and material; 1,554,179, 1,554,180, W. S. Trader, Sound absorbing material for walls and ceilings, filed Sept. 7, 1937, D. C., E. D. Mich. (Detroit), Doc. 8188, *J. Mazer et al.* v. *J. F. Murphy et al.*

1,485,338, P. M. Skrmetti, Floating trawling fish seine, filed Aug. 24, 1937, D. C., S. D. Miss. (Biloxi), Doc. E 506, *P. M. Skmetti* v. *A. Anderson et al.*

1,509,406, C. E. Kraus, Plastic compound and method of making; 1,509,478, same, Plastic composition, filed Aug. 30, 1937, D. C., W. D. Mich. (Grand Rapids), Doc. 2806, *Sialco, Inc.*, v. *Auto Specialties Mfg. Co.*

1,509,478. (See 1,509,406.)

1,513,172, B. E. Hill, Apparatus and process for removing non-condensible gases, D. C., W. D. N. Y., Doc. 1882, *J. Waddell et al. (West Side Machine Works)* v. *Eastman Kodak Co.* Decree for defendant Aug. 26, 1937.

1,554,179. (See 1,483,365.) 1,554,180. (See 1,483,365.)

Des. 105,104, Hines & McKeown, Sofa, filed Aug. 26, 1937, D. C., N. D. Ill., E. Div., Doc. 15754, *Pullman Couch Co. v. N. Futorian et al.*

Changes in Classification

Order No. 3,410, November 1, 1937, directs:

In *class 16, Miscellaneous Hardware* (Division 20), establish the following subclass and definition:

Hinges

128.1 Automobile hood.

128.1. Hinges particularly designed for automobile engine hoods where no significant structure of the hood is claimed. The device may include the support for the hinge or pintles and/or means for preventing rain, dust, etc., from passing through the hinge joint or for conducting the same away from the joint.

Note.—Where significant motor vehicle structure is claimed, see class 180, MOTOR VEHICLES, the combination of significant hood structure with the hinge being in subclass 69 and indented subclass.

The patents contained in this subclass have been taken for the most part from class 16, subclass 128, and various indented subclasses, and from class 180, Motor Vehicles, subclasses 69 and 69.01.

In *class 114, Ships* (Division 22), subclass 203, change the subclass title and definition to read as follows:

Hatches and covers

203 With fasteners.

203. Hatches combined with means for battening, securing or locking them in place.

Note.—For hatch-fastening clamps per se, search must be made in class 292, CLOSURE FASTENERS, subclass 256.5.

In *class 204, Electrochemistry* (Division 56), abolish the following subclass:

Synthesis

62 Carbides.

The patents formerly contained in this subclass have been placed for the most part in class 23, Chemistry, subclass 208.

In *class 292, Closure Fasteners* (Division 20), establish the following subclass and definition:

Clamps

256.5 Hatch fastener.

256.5. Devices under subclass 256 for securing ships' hatches or equivalent closures. These may operate directly upon the hatch to clamp it in place, or may clamp a tarpaulin which in turn holds the hatch in place, or may include clamping elements for both the hatch and the tarpaulin.

Note.—Combinations of hatch structure with clamping means are classified in class 114, SHIPS, subclass 203, and cross-referenced here for significant clamp structure.

The patents contained in this subclass have been taken for the most part from class 114, Ships, subclass 203.

In *class 13, Electric Furnaces* (Division 3), subclass 7, in the note following the definition cancel subclass 62 in class 204, and add: *and class 23, Chemistry, subclasses 208 and 209;* and in the second note following the definition of subclass 36 cancel the last subclass number "62".

In *class 70, Locks* (Division 20), subclass 156, change the twenty-third word of the definition from "controlling" to *controlled.*

In *class 99, Foods and Beverages* (Division 63), subclass 240, give to the note following the definition the number (*2*) and add the following note:

(1) **Search this class,** subclass 271, for apparatus for coloring or ripening fruit.

In *class 164, Cutting and Punching Sheets and Bars* (Division 57), subclass 0.2, give to the two notes following the definition the numbers (*1*) and (*4*) and add the following notes:

(2) Note.—See class 77, BORING AND DRILLING, for drills for boring holes in well tubing.

(3) Note.—See this class, subclass 108, for machines for punching holes in other tubes.

In *class 180, Motor Vehicles* (Division 10), subclass 69, add to the definition the following note:

(4) Note.—See class 16, MISCELLANEOUS HARDWARE, subclass 128.1, for hinges for automobile hoods.

In *class 248, Supports* (Division 52), subclass 156, in note (2) following the definition add: *and for golf bag holders which are ground-inserted, see this class, subclass 96.*

In *class 279, Chucks or Sockets* (Division 52), in the main class definition, in the reference to class 16 in the third note, change the subclass numbers "18 and 38" to read: *18 and indented subclasses, particularly subclass 43.*

In *class 280, Land Vehicles* (Division 10), in the main class definition, third line, cancel "railway, motor, or occupant-propelled vehicles", and insert: *railway or motor vehicles.*

In *class 285, Pipe Joints or Couplings* (Division 52), subclass 22, in the note following the definition change the subclass number "22" to read *72.*

TRADE-MARKS

OFFICIAL GAZETTE, NOVEMBER 16, 1937

[VOL. 484. No. 3]

The following trade-marks are published in compliance with section 6 of the act of February 20, 1905, as amended March 2, 1907. Notice of opposition must be filed within thirty days of this publication.

Marks applied for "under the ten-year proviso" are registrable under the provision in clause (b) of section 5 of said act as amended February 18, 1911.

As provided by section 1 of said act, a fee of ten dollars must accompany each notice of opposition.

CLASS 1

Raw or Partly Prepared Materials

Ser. No. 395,520. EAGLE-OTTAWA LEATHER COMPANY, Chicago, Ill., and Grand Haven, Mich. Filed July 22, 1937.

The word "Ottawa" is disclaimed apart from the mark.
For Leather.
Claims use since Feb. 1, 1937.

Ser. No. 395,521. EAGLE-OTTAWA LEATHER COMPANY, Chicago, Ill., and Grand Haven, Mich. Filed July 22, 1937.

Guild EAGLE OTTAWA Hall

The word "Ottawa" is disclaimed apart from the mark.
For Leather.
Claims use since Feb. 1, 1937.

Ser. No. 396,678. GERMAIN SEED AND PLANT COMPANY, Los Angeles, Calif. Filed Aug. 23, 1937.

Quintuplet

For Flower Seeds—Namely, Zinnias and Flower Garden Mixture.
Claims use since Aug. 11, 1937.

CLASS 2

Receptacles

Ser. No. 393,683. WILLIAM C. ANTHONY, Streator, Ill. Filed June 5, 1937.

The representation of the tank or container is disclaimed apart from the mark.
For Plant Growing Tanks and Parts Thereof and Accessories Therefor, to wit, Fluid Connections and Fluid Level Controlling Devices.
Claims use since Apr. 26, 1937.

Ser. No. 395,052. ROBERT J. SIMONS, Springfield, Mass. Filed July 9, 1937.

For Paint Brush Receptacles with Incidental Holding Means.
Claims use since Apr. 10, 1937.

Ser. No. 395,499. UNION BAG & PAPER CORPORATION, New York, N. Y. Filed July 21, 1937.

PĒK

For Transparent Window Bags and Other Paper Bags.
Claims use since July 17, 1937.

Ser. No. 396,447. CENTRAL METALLIC CASKET CO., Chicago, Ill. Filed Aug. 16, 1937.

The words "Caskets of Character" are disclaimed apart from the mark.
For Caskets.
Claims use since May 12, 1937.

Ser. No. 397,994. BAGPAK, INC., New York, N. Y. Filed Oct. 1, 1937.

For Paper Bags.
Claims use since Sept. 15, 1937.

Ser. No. 398,012. NEW YORK STANDARD MFG. CO., INC., Brooklyn, N. Y. Filed Oct. 1, 1937.

Sani-Craft

For Clothes Hampers, Ash Cans, and Garbage Cans.
Claims use since July 15, 1937.

CLASS 3

Baggage, Animal Equipments, Portfolios, and Pocketbooks

Ser. No. 384,629. PROGRESSIVE LEATHER GOODS CO., West New York, N. J. Filed Oct. 21, 1936.

Esquire

For Leather Goods, Particularly Bill Folds, Fitted and Unfitted Toilet Kits.
Claims use since Sept. 1, 1936.

CLASS 4

Abrasive, Detergent, and Polishing Materials

Ser. No. 397,016. AMERICAN STEEL WOOL MFG. CO. INC., Long Island City, N. Y. Filed Sept. 2, 1937.

ROPE-O-WOOL

The words "Rope" and "Wool" are disclaimed apart from the mark.
For Steel Wool.
Claims use since July 1, 1937.

CLASS 6

Chemicals, Medicines, and Pharmaceutical Preparations

Ser. No. 372,580. PY-RO-GO, INC., Chicago, Ill. Filed Dec. 12, 1935.

PY-RO-GO

For Preparation for the Treatment for Pyorrhea.
Claims use since Sept. 29, 1935.

Ser. No. 385,173. AMERICAN MAIZE-PRODUCTS COMPANY, New York, N. Y. Filed Nov. 5, 1936.

TAB-TEX

For Starch to be Used as a Raw or Partly Prepared Material for Various Industrial and Pharmaceutical Purposes.
Claims use since Oct. 22, 1936.

Ser. No. 389,854. WARWICK CHEMICAL COMPANY, West Warwick, R. I. Filed Mar. 9, 1937.

For Water Repellent Compound Used in the Processing of Textile Fabrics.
Claims use since Jan. 15, 1937.

Ser. No. 389,855. WARWICK CHEMICAL COMPANY, West Warwick, R. I. Filed Mar. 9, 1937.

WEATHER-SEALED

For Water Repellent Compound Used in the Processing of Textile Fabrics.
Claims use since Jan. 15, 1937.

Ser. No. 389,856. WARWICK CHEMICAL COMPANY, West Warwick, R. I. Filed Mar. 9, 1937.

WATER-SEALED

For Water Repellent Compound Used in the Processing of Textile Fabrics.
Claims use since Jan. 15, 1937.

Ser. No. 391,344. WILLIAM H. ROHER, INC., Philadelphia, Pa. Filed Apr. 14, 1937.

HYPOTUBE

For Tubes Filled With a Medicinal Solution for Injection Purposes.
Claims use since Mar. 29, 1937.

Ser. No. 392,382. FRIEDRICH MERZ, doing business as Merz & Co., Frankfort-on-the-Main, Germany. Filed May 6, 1937.

Capsulan

For Medicinal Preparation Used in the Treatment of Ulcers, Tuberculosis, Carcinoma, Chronic Suppurations, Eczema, and Venereal Diseases.

Ser. No. 397,437. GENERAL CHEMICAL COMPANY, New York, N. Y. Filed Sept. 15, 1937.

For Heavy Chemicals, Particularly Sodium Sulphide, Salt Cake, Sodium Bisulphite, Acetic Acid, Ferric Sulphate, Ferric Nitrate, Stannous Chloride, Iron Sulphide, Lead Acetate, Nitre Cake, Aluminum Sulphate, Sulphur, Oxalic Acid, Ammonia Alum, Potash Alum, Sodium Hyposulfite, Epsom Salt, Glauber's Salt, Sodium Meta-Silicate, Sodium Aluminum Sulphate, Sodium Fluoride, Disodium Phosphate, Trisodium Phosphate, and Sodium Sulphite, and for Fungicides and Insecticides.

Claims use to said sodium sulphide since June, 1929, to said salt cake and sodium bisulphite since August, 1929, to said acetic acid, ferric sulphate, ferric nitrate and stannous chloride since October, 1929, to said iron sulphide and lead acetate since November, 1929, to said nitre cake since November, 1930, to said aluminum sulphate since February, 1931, to said sulphur since May, 1933, to said oxalic acid since April, 1934, to said ammonia alum, potash alum, sodium hyposulfite and Epsom salt since July, 1934, to said Glauber's salt and sodium meta-silicate since August, 1934, to said sodium aluminum sulphate, sodium fluoride, disodium phosphate, trisodium phosphate and sodium sulphite since September, 1934, to said fungicides since May, 1933, and to said insecticides since September, 1934.

Ser. No. 397,438. GENERAL CHEMICAL COMPANY, New York, N. Y. Filed Sept. 15, 1937.

For Heavy Chemicals, Particularly Sodium Sulphide, Salt, Cake, Sodium Bisulphite, Acetic Acid, Ferric Sulphate, Ferric Nitrate, Stannous Chloride, Iron Sulphide, Lead Acetate, Nitre Cake, Aluminum Sulphate, Sulphur, Oxalic Acid, Ammonia Alum, Potash Alum, Sodium Hyposulfite, Epsom Salt, Glauber's Salt, Sodium Meta-Silicate, Sodium Aluminum Sulphate, Sodium Fluoride, Disodium Phosphate, Trisodium Phosphate, and Sodium Sulphite, and for Fungicides and Insecticides.

Claims use to said sodium sulphide since June, 1929, to said salt cake and sodium bisulphite since August, 1929, to said acetic acid, ferric sulphate, ferric nitrate and stannous chloride since October, 1929, to said iron sulphide and lead acetate since November, 1929, to said nitre cake since November, 1930, to said aluminum sulphate since February, 1931, to said sulphur since May, 1933, to said oxalic acid since April, 1934, to said ammonia alum, potash alum, sodium hyposulfite, and Epsom salt since July, 1934, to said Glauber's salt and sodium meta-silicate since August, 1934, to said sodium aluminum sulphate, sodium fluoride, disodium phosphate, trisodium phosphate, and sodium sulphite since September, 1934, to said fungicides since May, 1933, and to said insecticides since September, 1934.

Ser. No. 397,472. HOFFMANN-LA ROCHE, INC., Nutley, N. J. Filed Sept. 16, 1937.

VI-PENTA

For Medicinal Preparation Containing a Mixture of Vitamins.
Claims use since Sept. 1, 1937.

Ser. No. 397,489. SUDOL PRODUCTS, INC., New Orleans, La. Filed Sept. 16, 1937.

Sudol

For Water-Repellant Preparation for Use on Fabrics and Garments to Prevent Discoloration Thereof by Perspiration.
Claims use since July 27, 1937.

Ser. No. 397,594. UNITED DRUG COMPANY, Boston, Mass. Filed Sept. 20, 1937.

Rex-Optex

For Eye Lotion.
Claims use since Nov. 17, 1936.

Ser. No. 397,657. THE GENERAL PHARMACAL COMPANY, Cincinnati, Ohio. Filed Sept. 22, 1937.

TRU BLUE

For Analgesic and Antipyretic Compounds, Acetanilid Derivatives, Natural Colloidal Minerals, Bisma-Zyme-Olates, Diet Supplement Tablets, General Tonic Tablets,

Antacid Preparation, Compound Tablets for Relief of Pain, Hygienic Ointment, Mustard Ointment, Medicine for Relief of Asthma, Laxative and Cathartic Preparations.
Claims use since Oct. 1, 1915.

Ser. No. 397,720. PARK & TILFORD, New York, N. Y. Filed Sept. 23, 1937.

Adventure

For Perfumes.
Claims use since Sept. 2, 1937.

Ser. No. 397,799. EFF LABORATORIES, INC., Cleveland, Ohio. Filed Sept. 25, 1937.

POTENAY

For Concentrates and Preparations Rich in Vitamin Activity.
Claims use since Sept. 1, 1937.

Ser. No. 397,819. SCHERINO & GLATZ, INC., New York, N. Y. Filed Sept. 25, 1937.

BENZOCHROME

For Medicinal Preparations for the Treatment of Infectious Diseases of the Urinary Tract as Well as Other Mucous Membranes, Like Those of Ear, Nose, and Throat.
Claims use since Sept. 17, 1937.

Ser. No. 397,820. SCHERING & GLATZ, Inc., New York, N. Y. Filed Sept. 25, 1937.

CRESOCHROME

For Medicinal Preparations for the Treatment of Infectious Diseases of the Urinary Tract as Well as Other Mucous Membranes, Like Those of Ear, Nose, and Throat.
Claims use since Sept. 17, 1937.

Ser. No. 397,831. AMFRE DRUG CO., INC., New York, N. Y. Filed Sept. 27, 1937.

BILEFEROL

For Medicine for the Treatment of Gall Bladder.
Claims use since Sept. 14, 1937.

Ser. No. 397,872. REED DRUG COMPANY, INC., Miami, Fla. Filed Sept. 27, 1937.

Qui~etts

For Tablets for the Relief of Periodic Pain.
Claims use since May 25, 1937.

Ser. No. 397,894. ATLAS POWDER COMPANY, Wilmington, Del. Filed Sept. 28, 1937.

ZATEX

For Solutions of Cellulose Derivatives—Namely, Cellulose Esters and Ethers, for Printing, Finishing, Delustering and/or Coating Textiles, Fabric, Wool, Metal, Etc.
Claims use since Aug. 25, 1937.

Ser. No. 397,980. MELDOL, INCORPORATED, New York, N. Y. Filed Sept. 30, 1937.

MELDOL

For Composition for External Application for Effecting Reformation of Fleshy Portions of the Human Body and Preparation for External Application Useful in the Treatment of Human Ailments Through Causing Perspiration.
Claims use since Sept. 15, 1937.

Ser. No. 397,985. SILVER OXIDE PRODUCTS COMPANY, INCORPORATED, Aldan, Pa. Filed Sept. 30, 1937.

AROX

For Colloidally Dispersed Silver Oxide.
Claims use since Mar. 19, 1934.

Ser. No. 397,996. OTTO BECK, New York, N. Y. Filed Oct. 1, 1937.

AKLO

For Preparation for the Relief of Asthma and Bronchitis.
Claims use since Sept. 28, 1937.

Ser. No. 398,008. HOFFMANN-LA ROCHE, INC., Nutley, N. J. Filed Oct. 1, 1937.

PYROLID

For Medicinal Preparation Indicated for Use as a Sedative and Hypnotic.
Claims use since Sept. 15, 1937.

Ser. No. 398,099. THE DRUG PRODUCTS CO., INC., Long Island City, N. Y. Filed Oct. 4, 1937.

Man-Na-Cac-Col

For Colloidal Manganese Sodium Cacodylate Preparation in Ampul Form for Intragluteal Use.
Claims use since Sept. 22, 1937.

Ser. No. 398,115. LINO MANZONI, New York, N. Y. Filed Oct. 4, 1937.

Linok

For Extract for Hair Troubles.
Claims use since Sept. 29, 1937.

Ser. No. 398,173. PRINCE MATCHABELLI, INC., New York, N. Y. Filed Oct. 5, 1937.

INFANTA

For Perfumes and Eau de Cologne.
Claims use since Sept. 1, 1937.

Ser. No. 398,182. U. S. STANDARD PRODUCTS COMPANY, Woodworth, Wis. Filed Oct. 5, 1937.

SULO

For Medicinal Solution for Use in the Treatment of Arthritis.
Claims use since July 1, 1937.

Ser. No. 398,200. THE HARROWER LABORATORY, INC., Glendale, Calif. Filed Oct. 6, 1937.

Glomerulin

For Medicinal Preparation for Treatment of Nephritis, Albuminuria, and Renal Impermeability.
Claims use since Aug. 26, 1937.

Ser. No. 398,204. THE HARROWER LABORATORY, INC., Glendale, Calif. Filed Oct. 6, 1937.

Sedocrin

For Medicinal Preparation for Treatment of Hyperthyroidism.
Claims use since Aug. 26, 1937.

CLASS 8

Smokers' Articles, Not Including Tobacco Products

Ser. No. 397,190. THE EVEREDY COMPANY, Frederick, Md. Filed Sept. 7, 1937.

Gigolo

For Empty Cigarette Boxes.
Claims use since July 27, 1937.

Ser. No. 397,191. THE EVEREDY COMPANY, Frederick, Md. Filed Sept. 7, 1937.

Gigolette

For Empty Cigarette Boxes.
Claims use since July 27, 1937.

CLASS 9

Explosives, Firearms, Equipments, and Projectiles

Ser. No. 397,953. REMINGTON ARMS COMPANY, INC., Bridgeport, Conn. Filed Sept. 29, 1937.

SCOREMASTER

For Firearms, Particularly Sporting Shotguns and Rifles.
Claims use since Sept. 10, 1937.

CLASS 10

Fertilizers

Ser. No. 391,335. THE OSMO GARDEN COMPANY, Philadelphia, Pa. Filed Apr. 14, 1937.

OSMOCULTURE

For Material to Facilitate the Growth of Seeds, and Cuttings, and Seedlings Consisting in One Form of a Sterile Medium of Sand, Charcoal, and Leather Fibre and in Another Form of Leather Fibre and Wool.
Claims use since Aug. 10, 1936.

Ser. No. 396,938. VAN CAMP SEA FOOD CO., INC., Terminal Island, Calif. Filed Aug. 30, 1937.

LAY-AN-GROW

For Fertilizer.
Claims use since Aug. 14, 1937.

Ser. No. 397,296. PLANT FOOD CORP., Los Angeles, Calif. Filed Sept. 10, 1937.

GROWMASTER

For Fertilizers.
Claims use since Aug. 13, 1937.

Ser. No. 397,297. PLANT FOOD CORP., Los Angeles, Calif. Filed Sept. 10, 1937.

VERDITE

For Fertilizers.
Claims use since Mar. 11, 1935.

CLASS 11

Inks and Inking Materials

Ser. No. 397,626. TYBON CORPORATION, Philadelphia, Pa. Filed Sept. 21, 1937.

For Inked Ribbons and Carbon Paper.
Claims use since Apr. 7, 1937.

CLASS 12

Construction Materials

Ser. No. 382,153. FRANK C. FEISE, doing business as F. C. Feise Co., Roxborough, Philadelphia, Pa. Filed Aug. 14, 1936.

TENIKO

For Tennis Court Surfacings of Various Colors, Tennis Court Composition Clay Surfacings.
Claims use since May 15, 1936.

Ser. No. 387,674. THE ROBERT MITCHELL CO. LIMITED, Montreal, Quebec, Canada. Filed Jan. 11, 1937.

THERMOSASH

For Glass Window or Panel Units for Buildings, Display Windows, and Display Cases.
Claims use since Nov. 12, 1935.

CLASS 13

Hardware and Plumbing and Steam-Fitting Supplies

Ser. No. 394,551. RAINCLOUD WATER SOFTENER, INC., Green Bay, Wis. Filed June 26, 1937.

For Trap-Type Water Softeners.
Claims use since August, 1936.

Ser. No. 394,652. AMERICAN COOLER CO., INC., New York, N. Y. Filed June 28, 1937.

ACCO

For Beer Dispensing and Refrigeration Equipment and Bar Equipment—Namely, Flexible Tubes and Couplings, Metal Beer Hose, Taps, Rinsing Nozzles, Multiple Pressure Controls for Taps, Keg Tapping Faucets, Keg Vents, Sinks, Faucet and Valve Repair Washers, Bushings and Clamps for Beer Tapping Systems, Block Tin Pipe, Aluminum Beer Pipes, Lead Air Tubing, Pipe Hose Clamps, Draught Tubes and Fittings, Faucets, Air Pressure Regulator Valves, Brass Beer Fittings, Beer Pipe Cleaner Fittings, Bar Railings and Brackets, Pipe Fittings, Compression Fittings, Refrigerant Control Valves, Refrigeration Valves, and Shut Off Valves.
Claims use since Nov. 20, 1935.

CLASS 14

Metals and Metal Castings and Forgings

Ser. No. 391,616. BOCHUMER VEREIN FÜR GUSSTAHLFABRIKATION AKTIENGESELLSCHAFT, Bochum, Germany. Filed Apr. 21, 1937.

For Steel, Iron, Brass, Aluminum, and Like Metal Castings, Forgings, and Half-Finished Articles.
Claims use since July, 1924.

Ser. No. 396,675. FANSTEEL METALLURGICAL CORPORATION, North Chicago, Ill. Filed Aug. 23, 1937.

TANTALOY

For Metals and Alloys Thereof Adapted to Make Metal Working and Cutting Tools and to Make Wear-Resisting Surfaces Having Particular Reference to Refractory Metals Such as Tantalum, Columbium, Molybdenum, or Tungsten and Alloys Thereof.
Claims use since May 7, 1937.

Ser. No. 397,617. HIGH DUTY ALLOYS LIMITED, Slough, England. Filed Sept. 21, 1937.

For Unwrought and Partly Wrought Metals, and Stampings, Forgings, Die Castings, Sand Castings, and Extruded Sections All of Ordinary Metal.
Claims use since Feb. 23, 1937.

Ser. No. 397,618. HIGH DUTY ALLOYS LIMITED, Slough, England. Filed Sept. 21, 1937.

HIDUMINIUM

For Unwrought and Partly Wrought Metals, and Stampings, Forgings, Die Castings, Sand Castings, and Extruded Sections, All of Ordinary Metal.
Claims use since Sept. 1, 1937.

Ser. No. 398,011. LUDLUM STEEL CO., Watervliet, N. Y. Filed Oct. 1, 1937.

EB-

For Tool-Steels.
Claims use since July 1, 1915.

CLASS 15

Oils and Greases

Ser. No. 377,804. THE PURE OIL COMPANY, Chicago, Ill. Filed Apr. 29, 1936.

For Liquid Hydrocarbon Motor Fuel, Lubricating Oils, and Lubricating Greases.
Claims use since Apr. 21, 1936.

Ser. No. 394,745. THE FACTORY OIL COMPANY, Akron, Ohio. Filed July 1, 1937.

Facto

For Gasoline and Oils.

For Brass Rods.
Claims use since Jan. 21, 1936.

352,135. (CLASS 45. BEVERAGES, NONALCOHOLIC.) STEPHEN JANIK, Niagara Falls, N. Y. Filed Sept. 4, 1937. Serial No. 397,121.

RYAN DRY

For Non-alcoholic, Non-cereal, Maltless Beverages Sold as Soft Drinks, and Syrups and Extracts for Making the Same.
Claims use since Aug. 1, 1936.

TRADE-MARK REGISTRATIONS RENEWED

118,487. A MONTHLY PUBLICATION. Registered September 18, 1917. BAERS'. Renewed September 18, 1937, to Edwin I. Baer, doing business as Baers', Canton, Ohio, successor.

118,640. RUBBER-COVERED ELECTRICAL WIRES AND CABLES. Registered September 25, 1917. THE ELECTRIC CABLE CO., Bridgeport, Conn. Renewed September 25, 1937, to Habirshaw Cable and Wire Corporation, New York, N. Y., a corporation of New York, assignee.

119,256. FRESH RHUBARB, ASPARAGUS, AND CANTALOUPS. Registered November 13, 1917. CALIFORNIA VEGETABLE UNION. Renewed November 13, 1937, to Jones & Kavanaugh Co., Ltd., Los Angeles, Calif., a corporation of California, successor.

119,315. COTTON PIECE GOODS IN THE GRAY. Registered November 13, 1917. HUNTER MANUFACTURING & COMMISSION CO., New York, N. Y. Renewed November 13, 1937, to Sanford Cotton Mills, Sanford, N. C., a corporation of North Carolina, assignee.

120,301. PREPARED CHALK AND WHITING FOR MEDICINAL PURPOSES. Registered January 29, 1918. THE THOMAS MANUFACTURING CO., Baltimore, Md., a corporation of Maryland. Renewed January 29, 1938.

120,507. CIRCULATING SYSTEMS, STEAM AND HOT-WATER BOILERS, AND HEATERS. Registered February 12, 1918. THE LONG-LANDRETH-SCHNEIDER COMPANY, New Brunswick, N. J. Renewed February 12, 1938, to United American Bosch Corporation, Springfield, Mass., a corporation of New York, assignee by mesne assignments.

121,044. A DAILY NEWSPAPER. Registered April 2, 1918. THE CHRONICLE PUBLISHING COMPANY, San Francisco, Calif., a corporation of Nevada. Renewed April 2, 1938.

121,187. CERTAIN NAMED RECEPTACLES. Registered April 16, 1918. KEINER WILLIAMS STAMPING CO., New York and Richmond Hill, N. Y. Renewed April 16, 1938, to Keiner Williams Stamping Co., Richmond Hill, N. Y., a corporation of New York.

LABELS

REGISTERED NOVEMBER 16, 1937

50,361.—*Title:* MONOGRAM. For Blended Whiskey. THE AMERICAN DISTILLING COMPANY, Baltimore, Md., and Pekin, Ill. Published September 21, 1937.

50,362.—*Title:* THIS HAIR NET IS MADE BY HAND OF FINE QUALITY RE-STERILIZED HUMAN HAIR, WHICH MATCHES HAIR SO PERFECTLY THAT IT IS NOT PERCEPTIBLE TO THE EYE. For Hair Nets. WILLIAM FINKELSTEIN, doing business as Eastern Trading Company, New York, N. Y. Published December 1, 1936.

50,363.—*Title:* THE PERFECT HUMAN HAIR NET. For Hair Nets. WILLIAM FINKELSTEIN, doing business as Eastern Trading Company, New York, N. Y. Published December 1, 1936.

50,364.—*Title:* TOURIST HAIR NET. For Hair Nets. G. H. S. CORP., New York, N. Y. Published December 31, 1936.

50,365.—*Title:* GILBERT ELECTRIC EYE. For Electric Eye Sets. THE A. C. GILBERT COMPANY, New Haven, Conn. Published August 26, 1937.

50,366.—*Title:* EARLES BEAUTIFUL SHOES. For Boxes. HOAGUE-SPRAGUE CORPORATION, Lynn, Mass. Published February 18, 1937.

50,367.—*Title:* FORMOSA OOLONG TEA—MANNINGS CHOICE OOLONG TEA. For Tea. MANNINGS, INC., San Francisco, Calif. Published September 14, 1937.

50,368.—*Title:* CHINA GUNPOWDER TEA—MANNINGS CHINA GREEN TEA. For Tea. MANNINGS, INC., San Francisco., Calif. Published September 14, 1937.

50,369.—*Title:* ENGLISH BREAKFAST TEA—MANNINGS CHINA BLACK TEA. For Tea. MANNINGS, INC., San Francisco, Calif. Published September 14, 1937.

50,370.—*Title:* HI HO. For Canned Peas. MINNESOTA VALLEY CANNING COMPANY, Le Sueur, Minn. Published July 26, 1937.

50,371.—*Title:* CHEERIO THE PERSONAL KUP. For Hot and Cold Drinks. MONO SERVICE CO., Newark, N. J. Published July 1, 1937.

50,372.—*Title:* PESTEND. For Roach Paste. PESTEND PRODUCTS CO., New York, N. Y. Published July 12, 1937.

50,373.—*Title:* CREAMERY BUTTER. For Butter. POLLOCK PAPER & BOX COMPANY, Dallas, Tex. Published October 4, 1937.

50,374.—*Title:* HAPPY HOME BRAND. For Tubs and Pails. TENNISON BROTHERS, INC., Memphis, Tenn. Published October 6, 1937.

50,375.—*Title:* KORRECTED-KURVE KRYPTOK. For Spectacles. TIDEWATER OPTICAL CO., INC., Norfolk, Va. Published August 15, 1937.

50,376.—*Title:* "X" PIPECUT OIL. For a Pipe Thread Cutting Oil. "X" LABORATORIES, INC., New York, N. Y. Published June 5, 1937.

50,377.—*Title:* "X" PIPEJOIN SEALS. For a Pipe Sealing and Joining Compound. "X" LABORATORIES, INC., New York, N. Y. Published June 5, 1937.

PRINTS

REGISTERED NOVEMBER 16, 1937

16,571.—*Title:* EAT CANDY FOR FUN. For Candy. AWFUL FRESH MACFARLANE, Oakland and San Francisco, Calif. Published October 15, 1937.

16,572.—*Title:* .34¢ EACH FOR MY CANDY SHANTY. For Candy. AWFUL FRESH MACFARLANE, Oakland and San Francisco, Calif. Published October 15, 1937.

16,573.—*Title:* THE TRUE STORY OF BIGELOW RUGS & CARPETS. For Carpets and Rugs. BIGELOW-SANFORD CARPET CO. INC., New York, N. Y. Published October 5, 1937.

16,574.—*Title:* GO, TEAM GO! For Wheat Breakfast Food. THE CREAM OF WHEAT CORPORATION, Minneapolis, Minn. Published October 15, 1937.

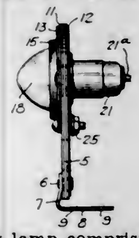
16,575.—*Title:* A BREAKFAST OF CHAMPIONS—IT'S THE TOPS! ELLSWORTH VINES WORLD'S BEST TENNIS PLAYER. For Cereal Food. GENERAL MILLS, INC., Minneapolis, Minn. Published September 28, 1937.

16,576.—*Title:* DO YOUR FEET HURT? HOW HEALTH SPOT SHOES KEEP ANKLES STRAIGHT HERE'S FOOT COMFORT! For Shoes. MUSEBECK SHOE COMPANY, Danville, Ill. Published October 8, 1937.

16,577.—*Title:* PARKE-DAVIS STANDARDIZED VITAMIN PRODUCTS. For Vitamin Products in Concentrated Form. PARKE, DAVIS & COMPANY, Detroit, Mich. Published September 1, 1937.

16,578.—*Title:* LOXOL. For an Oil Shampoo Tint. SALES AFFILIATES, INC., New York, N. Y. Published September 23, 1937.

REISSUES



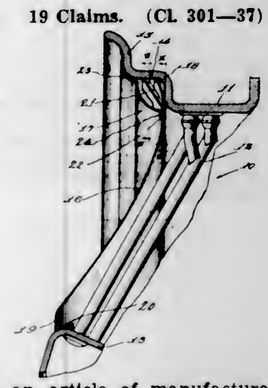
NOVEMBER 16, 1937

20,552
WARNING LIGHT

Ernest Earl Highfill, deceased, late of Los Angeles, Calif., by Jesse D. Langdon, Los Angeles, Calif., assignee, assignor of two-thirds to George J. Kilgen and Edward W. Todd, both of Los Angeles, Calif.

Original No. 2,024,858, dated December 17, 1935, Serial No. 737,316, July 27, 1934. Application for reissue May 11, 1937, Serial No. 142,074

6 Claims. (Cl. 240—8.3)



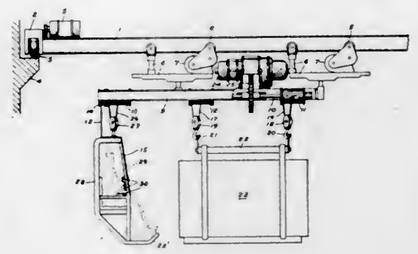
5. A warning lamp comprising a substantially flat support of resilient vulcanized material, relatively narrow at one end, mounting means at said narrow end, said support flaring toward its other end and terminating in a substantially circular body portion, an opening through said body, a lamp socket housing on one side of said body adjacent said opening, a lamp socket retained by said housing and adapted to receive the shank of an electric lamp inserted through said opening, a lens retaining rim on the other side of said body concentric with said opening and projecting forwardly and radially inwardly with respect thereto, a cup shaped lens having a peripheral bead retained within said rim, forming a chamber for the globe of said lamp, and electrical connections for said socket.

20,553
ORNAMENTAL PLATE FOR WHEELS

George Albert Lyon, Allenhurst, N. J.

Original No. 1,949,317, dated February 27, 1934, Serial No. 646,762, December 12, 1932. Application for reissue January 28, 1935, Serial No. 4,997

19 Claims. (Cl. 301—37)



19. As an article of manufacture, an ornamental disk of sheet metal for disposition between the rim and hub portions of a wheel to cover completely the space separating such portions, said disk having associated with its outer marginal portion a ring-like annular ornamental bead for increasing the overall diameter of the disk and including concealed resilient means for engaging a portion of the wheel.

20,554
TRAVELING HOIST

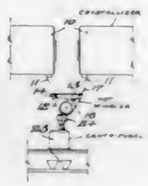
William H. Ringe, Berkeley, Calif.

Original No. 2,061,044, dated November 17, 1936, Serial No. 72,547, April 3, 1936. Application for reissue August 9, 1937, Serial No. 158,230

6 Claims. (Cl. 212—126)

1. A traveling hoist having a hoisting rope and load-carrying device, a second hoist rope spaced from the first rope, an operator's cage suspended from said second hoist rope adjacent the load, a winding drum for each rope, means positively insuring simultaneous operation of both ropes at all points in raising and lowering, remote control electrical connections on said cage with flexible leads therefrom for controlling all motions of said traveling hoist and said ropes, and a winding drum for said leads associated with the drum of said second hoist rope.

20,555
EARTHENWARE BODIES

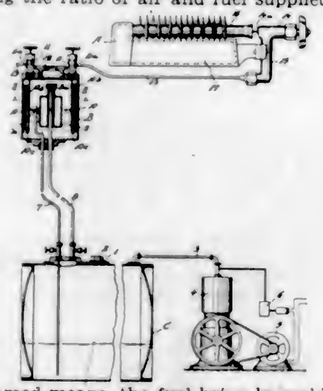


Ira E. Sproat, Westport, Conn., assignor to R. T. Vanderbilt Company, Incorporated, New York, N. Y., a corporation of New York

No Drawing. Original No. 2,068,154, dated January 19, 1937, Serial No. 47,413, October 30, 1935. Application for reissue August 26, 1937. Serial No. 161,082

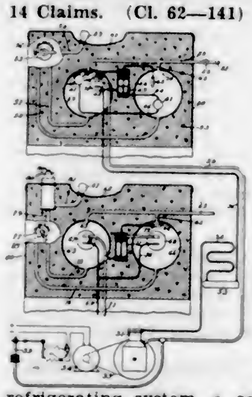
8 Claims. (Cl. 106—11)

1. Glazed, semi-vitreous, earthenware bodies having a bisque made from a mixture comprising clay from the class consisting of ball clays, kaolins and china clay, and pyrophyllite, both in substantial amount, and a small percentage of a calcium compound sufficient to impart decreased moisture expansion in the resulting body, the amount of calcium compound being greater than that occurring naturally in the pyrophyllite and clay and between about 0.5 and 5%, calculated as calcium oxide.



20,556
PROCESS FOR TREATING MASSECUITE
George E. Stevens, Denver, Colo., assignor to Western States Machine Company, Salt Lake City, Utah, a corporation of Utah
Original No. 2,055,778, dated September 29, 1936, Serial No. 725,404, May 12, 1934. Application for reissue January 13, 1937, Serial No. 120,408
8 Claims. (Cl. 127—56)

7. The process of treating viscous mixtures of sugar crystals and syrup to be centrifuged which comprises introducing a large mass of such material into a mixing tank overlying a battery of centrifugal machines, establishing contact and relative movement between that portion of the mass adjacent the bottom of said tank and extensive heated surfaces distributed substantially uniformly in the space within the tank in the lower portion thereof and heated uniformly to a temperature not harmfully in excess of the maximum temperature at which the material needs to be kept for efficient centrifuging, maintaining such contact and relative movement to ensure uniformity of temperature and uniform high fluidity in said portion, withdrawing charges of the fluid heated material through the bottom of the tank and immediately centrifuging the same and replacing the withdrawn material by material from that portion of the mass above said heated surfaces.

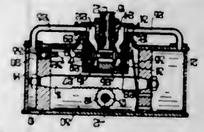


20,557
HYDROCARBON FUEL BURNING SYSTEM
Frank V. Risinger, Lakewood, Ohio
Original No. 1,988,334, dated January 15, 1935, Serial No. 458,327, May 31, 1930. Application for reissue October 9, 1936, Serial No. 104,870
37 Claims. (Cl. 158—53)

1. In a hydrocarbon burning apparatus of the class described, a hydrocarbon burner, a main fuel and air supply, an auxiliary fuel and air supply, means for supplying air and fuel from said main supply to said auxiliary supply instrumentalities in the auxiliary supply for converting the fuel into a mist-like condition, means for supplying fuel and air in the mist-like condition from said auxiliary supply to said burner under pressure, and means in the auxiliary supply for varying the ratio of air and fuel supplied by the

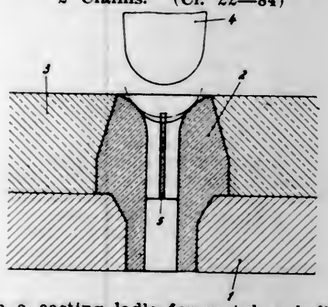
last named means, the fuel being burnable without preheating.

20,558
REFRIGERATING APPARATUS
Robert R. Candor, Dayton, Ohio, assignor, by mesne assignments, to General Motors Corporation, a corporation of Delaware
Original No. 1,899,013, dated February 28, 1933, Serial No. 499,040, November 29, 1930. Application for reissue February 28, 1935, Serial No. 8,773
14 Claims. (Cl. 62—141)



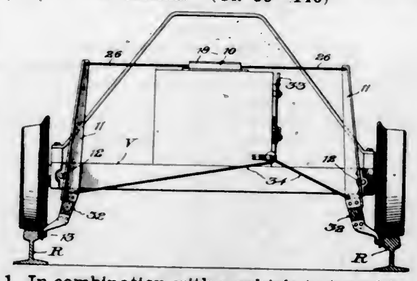
11. In a refrigerating system, a cold storage tank containing a cooled liquid, a refrigerating evaporator positioned inside the tank, a refrigerating evaporator positioned outside said tank and cooling a medium, the two evaporators being connected in parallel, means for circulating a refrigerant through either one of said evaporators, and means for conveying cooled liquid to aid in cooling said medium.

PATENTS



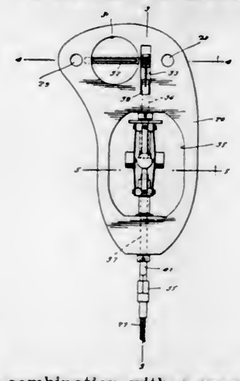
GRANTED NOVEMBER 16, 1937

2,098,936
WINDSHIELD WIPER MOTOR
Fullerton George Gordon Armstrong, Beverley, and Howard Clayton-Wright, Stratford-on-Avon, England; said Clayton-Wright assignor to said Armstrong
Application August 25, 1936, Serial No. 97,862
In Great Britain June 12, 1935
7 Claims. (Cl. 121—164)



1. A control mechanism for a windshield wiper comprising a cylinder, a double acting piston operating within said cylinder, a member disposed within said cylinder between the heads of said piston and having a bore therethrough, means providing a pair of valve seats in axial alignment with said bore and disposed one on each side of said member and spaced therefrom, a movable solid spindle extending through said bore and said valve seats, a pair of valves fixedly mounted on said spindle and disposed one on each side of said member within the spaces between said member and said valve seats, conduit means including ports opening through said valve seats, and fluid pressure means passing through said conduit means for displacing said piston and effecting relative movement between said valve seats and said valves for alternately closing one of said valve seats and the remote end of said bore whereby to effect reciprocation of said piston and displacement of a connected wiper.

2,098,937
LADLE FOR CASTING FLUID METAL
Heinrich Brinkmann, Dortmund, Germany
Application January 8, 1936, Serial No. 58,196
In Germany March 2, 1934
2 Claims. (Cl. 22—84)

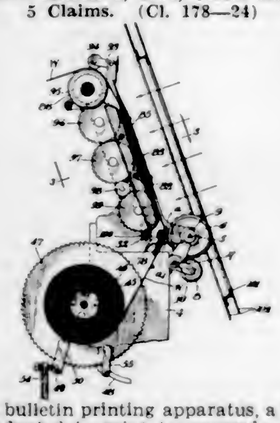


1. In a casting ladle for metal, a ladle body having an outflow opening in the bottom thereof and a subsequently insertable guiding member arranged in the upper portion of the outflow opening, said guiding member consisting of crosswise arranged thin-walled ribs extending in the longitudinal direction of the outflow opening and in fixed relation thereto, the portion of the outflow opening below the said guiding member having straight sides and the same diameter as the upper portion.

2,098,938
TRACK GAUGE INDICATOR
Edward William Backes, Cook County, Ill., assignor to Poor & Company, New York, N. Y., a corporation of Delaware
Application April 16, 1937, Serial No. 137,363
4 Claims. (Cl. 33—146)

1. In combination with a vehicle to travel track rails, a pair of rail gauge face contacting members mounted on said vehicle for inward and outward movement, a movable indicating element, spring means for moving said indicating element in one direction, a sheave swingable with said element, a flexible element connected at its ends with said rail contacting members and engaged over said sheave, other sheaves having fixed operative positions and with which said flexible element is engaged whereby said rail contacting elements are urged constantly outwardly into contact with the rails by said spring means, index means with which said indicating element cooperates to indicate variations in the gauge of the rails, and means for laterally adjusting one of said sheaves relative to another of said sheaves thereby to adjust said flexible element and said indicating element to obtain an initial setting of said indicating element relative to said index means corresponding to true gauge of the rails.

2,098,939
MOTOR GOVERNOR
Roy Barbour, Beaufort, N. C.
Application October 24, 1936, Serial No. 107,450
2 Claims. (Cl. 180—82)



1. The combination with a speedometer drive shaft of an internal combustion engine, of a flat

plate-like member secured in position in the fuel feed line of the engine and having a fuel passage extending therethrough, a throttle valve mounted in said passage for controlling the supply of fuel one end of the member projecting outwardly from the engine and having an opening therein, and a driving connection between the throttle valve and the speedometer shaft, said driving connection including a centrifugal governor mounted in said last named opening for controlling the opening and closing of the throttle valve in response to the speed of the speedometer shaft.

2,098,940
WEB FEEDING MECHANISM

August H. Blohm, Chicago, Ill., assignor to Trans-Lux Corporation, New York, N. Y., a corporation of Delaware

Application March 8, 1930, Serial No. 434,272
5 Claims. (Cl. 178—24)

1. In a bulletin printing apparatus, a telegraph printer adapted to print transversely of a web, a web take-up mechanism, a panel extending between said printer and take-up mechanism and means for maintaining said web continuously in contact with said panel as it passes from the printer to the take-up mechanism.

2,098,941
PROJECTION SYSTEM

August H. Blohm, Chicago, Ill., assignor to Trans-Lux Corporation, a corporation of Delaware

Application March 8, 1930, Serial No. 434,273
Renewed April 24, 1935
12 Claims. (Cl. 88—24)

1. In combination, a device for printing characters in line form on a web, means for feeding said web through a projection field, means cooperating with said field to obtain images of said characters, a housing for at least a part of said second named means, and a housing for said device, said web extending from said projection field through said second housing and passing exteriorly thereof through a slot formed in a wall thereof.

2,098,942
PROTECTION OF MATERIALS SUBJECT TO PARASITIC ATTACK

Merlin Martin Brubaker, Lindemere, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

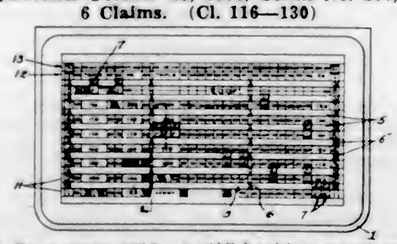
No Drawing. Application June 17, 1936, Serial No. 85,822. In Germany June 18, 1935
7 Claims. (Cl. 167—22)

1. A composition of matter suitable for protecting materials against parasitic attack comprising a dispersion of a parasiticide in a solution of a salt of a polymeric amino-nitrogen containing body substantially insoluble in water and in 5% aqueous ammonia but soluble in at least the stoichiometrical amount of 2% aqueous acetic acid and capable of forming a coherent film therefrom.

4. A composition of matter suitable for protecting materials against parasitic attack comprising a dispersion of a parasiticide in an aqueous solution of an acetate of deacetylated chitin.

2,098,943
PROCESS FOR DESULPHURIZING HYDROCARBONS

Albert E. Buell and Walter A. Schulze, Bartlesville, Okla., assignors to Phillips Petroleum Company, Bartlesville, Okla., a corporation of Delaware



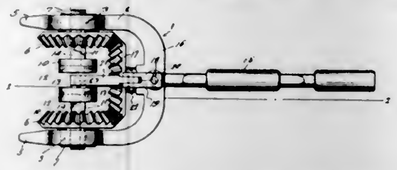
No Drawing. Original application June 10, 1932, Serial No. 616,574. Divided and this application May 21, 1935, Serial No. 22,659
7 Claims. (Cl. 196—28)

1. The process of desulphurizing petroleum hydrocarbon fluid containing organic sulphur compounds as impurities, comprising heating the fluid in the vapor state to a temperature within the range of 500° to 800° F., contacting the vapors at substantially the same temperature with a catalyst consisting of crude mineral ore containing a substantial proportion of a zinc compound, whereby the organic sulphur compounds are decomposed into hydrogen sulphide, and separating the hydrogen sulphide from the hydrocarbon fluid.

2,098,944
POCKET ROOM GUIDE

Wilbur J. Ceder, Los Angeles, Calif.

Application October 26, 1936, Serial No. 107,567
6 Claims. (Cl. 116—130)

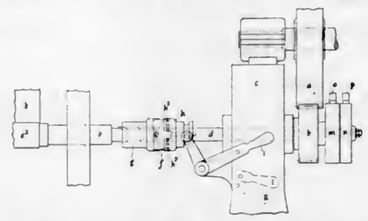


2. In a room guide, a stiff backing member; a yieldable plate thereover; a chart covering said plate and locally depressible therein; a plurality of bars supported from said backing member and normally lying contiguous to said chart; tab means adapted to be interposed between said bars and chart by depressing a local region of said chart into said plate; the portions of said chart exposed between said bars divided into rows and columns to define areas representative of rooms in a building; and said tab means adapted to be removably positioned over said areas for indicating predetermined facts regarding said rooms.

2,098,945
WIRE SPLICER

Robert W. Davis, Lexington, Ky.

Application July 3, 1936, Serial No. 88,901
1 Claim. (Cl. 140—115)



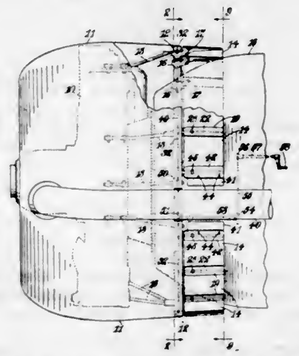
A wire splicing machine of the class described comprising a substantially U-shaped frame, bearings on the legs of said frame, said legs of said frame having horizontal slots therein extending from the bearings to the free ends thereof, said slots being for the insertion of wires to be twisted, a pair of opposed gears rotatably mounted in the frame and including elongated hubs journaled in the bearings, said gears and hubs having radial slots therein for registry with the first-named slots for receiving the wires therefrom, said hubs further having polygonal bores extending therethrough and communicating with the second-named slots, a pair of spaced, opposed twister heads mounted in the frame and including outwardly projecting shanks of polygonal cross section slidably engaged in the bores, said twister heads having substantially V-shaped recesses in their inner end portions and further having openings therein communicating with the inner portions of said recesses, said heads and the shanks further having grooves therein communicating with the recesses and adapted to communicate with the second-named slots, said grooves, recesses and the openings for the reception of the wires, a crank handle journaled in the bight portion of the frame, a gear fixed on said crank handle and engaged with the first-named gears for actuating the same in opposite directions, a post mounted on the frame, a bracket mounted on said post, and an angular holder pivotally mounted on the bracket and engageable with the wires between the twister heads for securing said wires against rotation.

2,098,946
FABRIC PRINTING MACHINE

Claud John Elliott, Ainsdale, Southport, England, assignor to The Calico Printers' Association Limited, Manchester, England, a British company

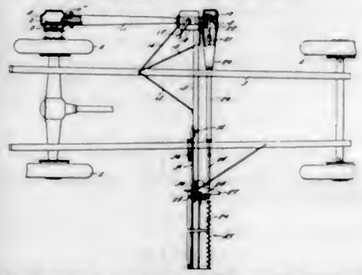
Application April 15, 1936, Serial No. 74,556
In Great Britain April 23, 1935
14 Claims. (Cl. 101—178)

1. A drive for the printing rollers of fabric printing machines, comprising a crown wheel, a plurality of box wheels in mesh with said crown wheel and having their axes fixed relatively to the axis of said crown wheel, a shaft for each said box wheel, a printing roller mandrel for each of said box wheels and a double universal coupling



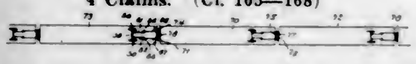
between each box wheel shaft and the associated printing roller mandrel.

2,098,947
COWL FOR AIR-COOLED AIRCRAFT ENGINES



Alfred Hubert Roy Fedden and John William Copley, Bristol, England, assignors to The Bristol Aeroplane Company Limited, Bristol, England, a British company

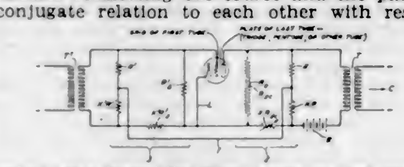
Application July 23, 1936, Serial No. 92,188
In Great Britain August 9, 1935
4 Claims. (Cl. 123—171)



1. A cowl for an air-cooled aircraft engine comprising a series of rearwardly-extending plate-like flaps entirely separate from the cowl, a pair of rearwardly-extending arms associated with each flap one at each margin thereof, a pair of longitudinal flanges on the side of each arm adjacent the flap so as to form a groove between them of which grooves at least one is of greater width than the thickness of the margin of the flap which can thus slide in at least one of said grooves, said margins being supported within said grooves, the circumferential distance between the flanges on one arm and the flanges on the other arm being substantially less than the corresponding dimension of the flap at all operating positions of the arms and the circumferential distance between the base of the groove on one arm and the base of the groove on the other arm being greater than the corresponding dimension of the flap, whereby the flap is supported solely by the arms at all operating positions thereof despite its being entirely separate from the cowl, a pivot for each arm lying along an axis at right-angles to a fore-and-aft central plane, and driving mechanism carried by a fixed part of the cowl and operatively connected to each said arm to rotate it about said pivotal axis.

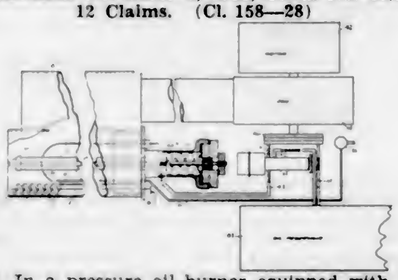
2,098,948
MOWER
William Foushee and Marson B. Heckendorn, Cedar Point, Kans.
Application July 29, 1936, Serial No. 93,266
2 Claims. (Cl. 56—25)

1. A mower attachment for motor driven vehicles, comprising a bar adapted to be suspended transversely from the chassis frame of a motor driven vehicle, a transmission housing on one end of said bar, transmission mechanism in said housing, driving mechanism for connecting the transmission mechanism with one of the driving wheels of the motor driven vehicle, a hand lever pivotally mounted on said bar, a head member suspended from said hand lever, a mower mechanism pivoted at one end thereof to said head member, link means connecting said lever intermediate its ends with said mower whereby rocking movement of the lever is transmitted to the mower for swinging the latter about its pivot to raise or lower the mower, said mower including a reciprocating cutter bar, and mechanism operatively connecting the transmission mechanism with the cutting bar of the mower for reciprocating the latter.



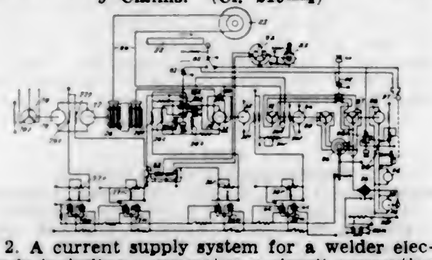
2,098,949
TRAIN
Carl Geissen, Berlin-Schoneberg, Germany, assignor of one-half to Rheinmetall-Borsig Aktiengesellschaft/Werk Borsig, Berlin-Tegel, Germany
Application January 9, 1937, Serial No. 119,799
In Germany January 8, 1936
4 Claims. (Cl. 105—168)

1. In an express train, comprising a plurality of single-axled cars and a multi-axled car; a supporting joint coupling interconnecting two adjacent cars and having a common pivot point the distance of which from said two adjacent cars remains constant; each of said single-axled cars having one divided axle, and means connected with said divided axle and an adjacent car to steer said divided axle depending upon the angle of intersection between the car carrying the divided axle and said adjacent car.



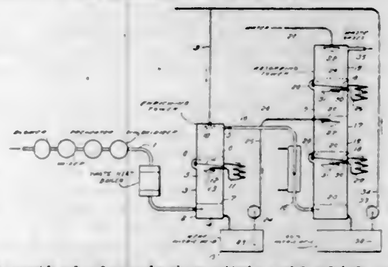
2,098,950
VACUUM TUBE CIRCUIT
Harold S. Black, Elmhurst, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application September 25, 1934, Serial No. 745,420
12 Claims. (Cl. 179—171)

1. A space discharge device having a space current supply source and feed-back path, and circuits connecting the source and the path in conjugate relation to each other with respect



only to steady unidirectional voltage and supplying a current from the source to the device and a current from the device to the path.

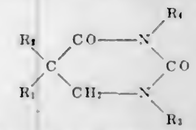
2,098,951
DUAL SAFETY DEVICE FOR OIL BURNERS
Jesse J. Brown, Syracuse, N. Y.
Application November 6, 1935, Serial No. 48,590
12 Claims. (Cl. 158—28)



1. In a pressure oil burner equipped with an oil spraying nozzle and blower, with means for supplying oil under pressure to said nozzle, and with a pressure responsive valve adapted to open at a pre-determined oil pressure, an oil burner safety control including an ignition means, a thermostatic element adjacent thereto and adapted to be heated thereby, and an electric circuit responsive to the action of the said thermostatic element having means associated therewith to control the supply of oil fuel to the burner independently of the energization of said blower motor, said means as controlled by said thermostatic element normally rendering said oil fuel supply operative with a time dwell after the blower operation is started.

2,098,952
APPARATUS FOR WELDING
James V. Caputo, Crafton, Pa.
Application March 14, 1934, Serial No. 715,489
9 Claims. (Cl. 219—4)

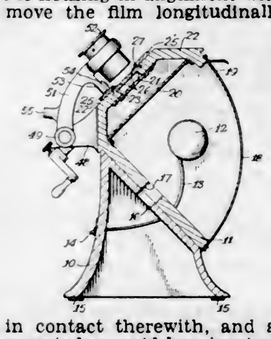
2. A current supply system for a welder electrode including a generator, a circuit connecting the generator and electrode, a motor for driving the generator, an exciter for the motor, means for regulating the excitation of the exciter to vary the excitation and speed of the motor, and means responsive to the voltage drop in a portion of one side of said circuit and effective to control said regulating means.



2,098,953
NITRIC ACID MANUFACTURE
Axel Christensen, Rye, N. Y., assignor to Chemical Construction Corporation, a corporation of Delaware
Application May 26, 1934, Serial No. 727,652
1 Claim. (Cl. 23—160)

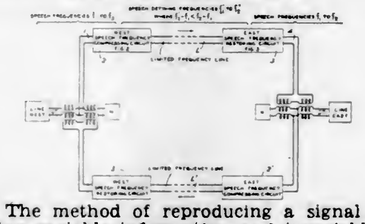
A method of producing nitric acid which comprises oxidizing ammonia with air to produce a gas mixture containing nitric oxide, passing said gas mixture after suitable cooling through an enriching tower in countercurrent to a flow of relatively cold nitric acid under conditions such that higher oxides of nitrogen are produced by the reaction $NO+2HNO_3=3NO_2+3H_2O$, passing the resulting gas mixture through an absorbing tower counter to a flow of an aqueous absorbing medium including spent acid from the bottom of the enriching tower, and feeding a portion of the condensate from said tower into the top of the enriching tower.

2,098,954
HYDROURACIL COMPOUNDS AND PROCESSES FOR THEIR PRODUCTION
Otto Dalmer, Claus Diehl, and Hartmann Pieper, Darmstadt, Germany, assignors to Merck & Co. Inc., Rahway, N. J., a corporation of New Jersey
No Drawing. Application January 3, 1934, Serial No. 705,130. In Germany January 3, 1933
24 Claims. (Cl. 260—32)



8. A hydrouracil compound having the general formula

in which R_1 and R_2 are lower alkyl radicals, and R_3 and R_4 are selected from the group consisting of hydrogen and lower alkyl radicals.

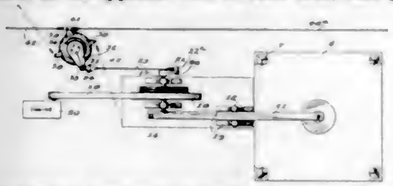


2,098,955
FILM EDITING DEVICE
Rupert H. Draeger, United States Navy
Application October 15, 1936, Serial No. 105,651
1 Claim. (Cl. 88—14)
(Granted under the Act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

In a film editing device, a housing having a curved back constituting a reflector and a ground glass top, a source of light in said housing, a glass window mounted on the outside of said housing above said glass top and spaced therefrom, said window being substantially coextensive with the housing, several times as long as it is wide, and of the same width as the film, grooved film guide bars overhanging the edges of said window, film feeding mechanism mounted on the sides of the housing in alignment with said window to move the film longitudinally over the

window in contact therewith, and an eyepiece slidably mounted on said housing in cooperative relation with the entire length of said window.

2,098,956
SIGNALING SYSTEM
Homer W. Dudley, Garden City, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 2, 1936, Serial No. 113,818
27 Claims. (Cl. 179—1.5)

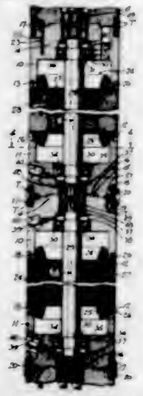


1. The method of reproducing a signal containing variable information and invariable information and represented by a complex wave, which consists in deriving from the complex wave a simple set of parameters having approximately the number of degrees of freedom of the variable elements of the signal source, deriving from said set of parameters a set of defining waves that respectively define the variations of said parameters, transmitting timed parts of each of said waves in successive order over a transmission medium to the exclusion of waves representing said invariable information, producing artificially waves representing said invariable information, and combining effects of said artificially produced waves and said transmitted waves to reproduce said signal.

2,098,957
WELL PUMPING UNIT
Harold G. Durnell and Samuel T. Steel, Bartlesville, Okla.
Application August 24, 1936, Serial No. 97,712
1 Claim. (Cl. 74—41)

Well pumping mechanism of the class described comprising in combination a power unit having a substantially horizontal crank shaft provided with front and rear cranks, a well pump walking beam, means operatively connecting the front crank to the walking beam for actuating the latter from the power unit, said rear crank being provided with a single power take-off, a substantially horizontally disposed wheel oscillatable about a vertical axis and arranged to one side of the power unit, said wheel having an arm projecting toward

the power unit, a pitman connected at one end to the power take-off of the rear crank and connected at its opposite end to said arm, said pitman having a universal joint interposed therein, and a number of power take-offs carried by said wheel.



2,098,958

MULTIPLE MOTOR UNIT

Edward C. Ekstromer, San Francisco, Calif., assignor to Electrolift Corporation, Reno, Nev., a corporation of Nevada

Application August 12, 1936, Serial No. 95,557

15 Claims. (Cl. 171—252)

1. A multiple motor unit for pumps comprising a plurality of motors arranged in end to end relation to each other; means serving to operatively connect one motor to another to enable the combined energy developed by all thereof to be transmitted to a mechanism to be driven; and means concentrically related to the axis of said unit and co-operable with said motors to move same axially into end to end engagement and rigidly securing them to each other.

2,098,959

PROCESSES FOR CONVERTING HYDROCARBONS

Frederick E. Frey and Walter F. Huppke, Bartlesville, Okla., assignors to Phillips Petroleum Company, Bartlesville, Okla., a corporation of Delaware

No Drawing. Application May 2, 1934, Serial No. 723,608

4 Claims. (Cl. 260—170)

1. A process for the non-destructive dehydrogenating of aliphatic hydrocarbons of at least two carbon atoms per molecule to corresponding hydrocarbons of lower hydrogen content, which comprises contacting said aliphatic hydrocarbons at temperatures above 325° C. with a vitreous gel catalyst comprising chromium oxide and a difficultly reducible oxide of the group aluminum, zirconium, titanium, silicon, thorium, boron, and magnesium, the said oxides having been combined in a state of intimate association effected while the oxides are in a highly hydrous condition.

2,098,960

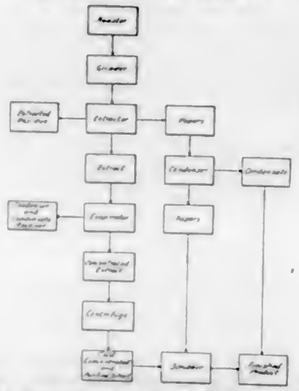
PROCESSES FOR CONVERTING HYDROCARBONS

Frederick E. Frey and Walter F. Huppke, Bartlesville, Okla., assignors to Phillips Petroleum Company, Bartlesville, Okla., a corporation of Delaware

No Drawing. Original application May 2, 1934, Serial No. 723,608. Divided and this application April 15, 1935, Serial No. 16,512

3 Claims. (Cl. 260—170)

1. In a process for hydrogenating unsaturated hydrocarbons, the steps which comprise passing the said unsaturated hydrocarbons together with hydrogen at temperatures above 200° C. in contact with a vitreous gel catalyst comprising chromium oxide and a difficultly reducible oxide of the group aluminum, zirconium, titanium, silicon, thorium, boron, and magnesium, the said oxides having been combined in a state of intimate association effected while the oxides are in a highly hydrous condition.



2,098,961

MANUFACTURE OF CONCENTRATED COFFEE EXTRACT

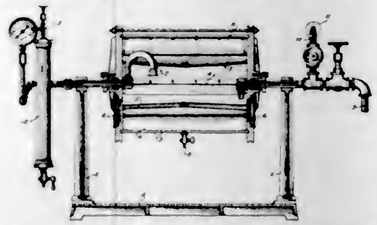
Douglas Fronmuller, Middle Village, N. Y., assignor to Coffee Products Corporation, New York, N. Y., a corporation of New York

Application July 3, 1934, Serial No. 733,558

4 Claims. (Cl. 99—71)

1. The improvement in the production of a concentrated liquid coffee extract from roasted coffee, which comprises extracting the ground, roasted coffee with hot or boiling water in a closed system to produce a coffee extract, concentrating the resulting coffee extract to an extent sufficient to produce a more concentrated liquid extract than that desired as the final product and cooling the concentrated extract, drawing off the vapors produced during the extraction and subjecting the same to a cooling and condensing treatment and also to a scrubbing treatment, the scrubbing treatment being carried out by using the super-concentrated cold liquid coffee extract as the scrubbing liquid and the condensed constituents, condensed from the vapors by the cooling and condensing treatment, being combined with the super-concentrated liquid coffee extract to give a concentrated cold liquid coffee extract containing the condensed constituents and also containing difficultly condensable and non-condensable constituents scrubbed from the vapors during such scrubbing treatment.

2,098,962



METHOD FOR CARRYING OUT AERATION IN BIOCHEMICAL PROCESSES

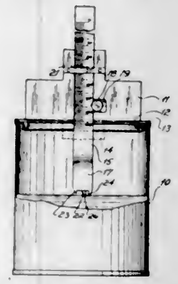
Rudolph Hellbach, Washington, D. C., assignor to Henry A. Wallace, for the Government of the United States

Application May 7, 1935, Serial No. 20,195

2 Claims. (Cl. 195—109)

(Granted under the act of March 3, 1883, as amended April 30, 1928; 370 O. G. 757)

1. A method for carrying out aeration in biochemical processes, which comprises introducing fermentable material into a container; subjecting said material to rotation; causing it to fall in substantially thin sheets, the while introducing a gas containing an appreciable quantity of oxygen; then causing the excess gases to escape from said container, and thereby making a continuous, intimate contact of the gas with the fermentable material.



2,098,963

SURFACE CONTACT GAUGE FOR LIQUIDS

Paul L. Hexter, Cleveland, Ohio, assignor to The Arco Company, Cleveland, Ohio, a corporation of Ohio

Application October 2, 1935, Serial No. 43,201

5 Claims. (Cl. 33—126.7)

1. A gauge of the class described comprising a support adapted to be positioned on the top of a container, a member adjustably mounted on said support, said member having a knife edge arranged substantially parallel with the surface of a liquid in said container and spaced extensions of different lengths below said edge which are adapted to contact with the surface of the liquid at successive levels below the level of said edge, when the container is being filled, and co-operating measuring means on said support and said member whereby said member is located in any desired position on said support.

2,098,964

ARTIFICIAL RESINS

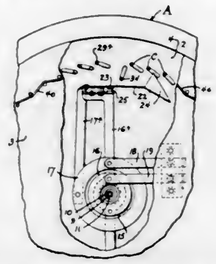
Rowland Hill and Eric Everard Walker, Blackley, Manchester, England, assignors to Imperial Chemical Industries Limited, London, England

No Drawing. Application October 31, 1928, Serial No. 316,346. In Great Britain, November 11, 1927

8 Claims. (Cl. 260—8)

1. In the manufacture of polyhydric alcohol-polybasic acid resins, the process which comprises condensing together the mono-ester of an organic polybasic acid composition and at least one polyhydric alcohol.

2. An alkyd resin convertible by heat to the infusible state consisting of the esterification product of a polybasic acid component and a mixture of polyhydric alcohols, one of which is a dihydric alcohol.



2,098,965

CLOCK

Henry C. James, Jr., Oakland, Calif., assignor to National Products, Inc., a corporation of California

Application February 24, 1936, Serial No. 65,453

5 Claims. (Cl. 200—38)

1. In combination with a clock mechanism, a carrier adapted to be rotated by the clock mechanism, a switch mounted on the carrier, said switch including a stationary and a movable contact, a plurality of actuators movable out of and into the path of travel of the switch to move the movable contact into engagement with the stationary contact, a pair of collector rings mounted on the carrier and insulated therefrom, a circuit connection between one ring and the movable contact, a similar connection between the other ring and the stationary contact, a pair of brushes engageable with the collector rings, and a plurality of actuators movable out of or into the path of travel with the movable contact.

2,098,966

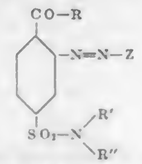
POLISHING PAD

Russell B. Kingman, Orange, N. J.

Application January 6, 1937, Serial No. 119,206

17 Claims. (Cl. 91—54.7)

1. A pad having an expressible polishing agent content, comprising corrugated holder means, channels of which provide holding chambers, masses of polishing agent within said holding chambers, and means through which said polish-



ing agent may be gradually expressed from said holding chambers by pressure and movement imparted to the pad in use.

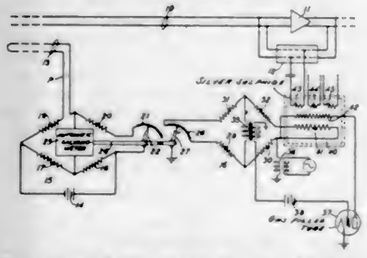
2,098,967
AZO DYESTUFFS

Max Lange, Frankfort-on-the-Main-Hochst, Germany, assignor to General Aniline Works, Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application July 9, 1935, Serial No. 30,563. In Germany August 4, 1934
4 Claims. (Cl. 260—92)

1. The azo-dyestuffs of the following general formula:

wherein R represents a member of the group consisting of OH, O-alkyl and the grouping

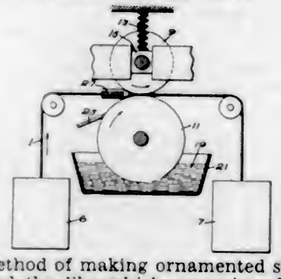


in which X and Y stand for members of the group consisting of hydrogen, alkyl and phenyl radicals, R′ and R″ stand for members of the group consisting of hydrogen, alkyl and phenyl radicals and Z means the radical of an aminonaphtholsulfonic acid, dyeing the animal fiber in general red shades of good fastness properties, particularly of a very good fastness to light and a good fastness to perspiration.

2,098,968
TRANSMISSION REGULATION

Charles O. Mallinckrodt, Forest Hills, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application June 14, 1935, Serial No. 26,577
9 Claims. (Cl. 178—44)

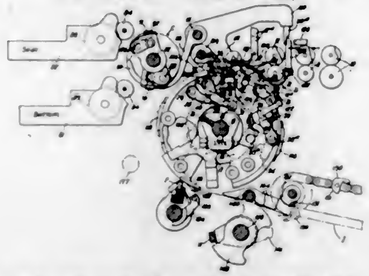


7. In a regulating system for transmission lines, including repeaters, a pilot conductor, a Wheatstone bridge controlled thereby, a heat chamber containing a thermo-sensitive element adapted to control the gain of a repeater, a source of heating current for said heat chamber, means controlled by an unbalance condition of said bridge to control the supply of heating current to said heat chamber to vary the temperature of its interior to different temperatures all above room temperature, and means independent of said pilot wire for controlling the balance of said bridge to control the supply of heating current to said heating chamber.

2,098,969
METHOD OF MAKING SHOE TRIMMINGS AND THE LIKE

Albert C. Murray, Wakefield, Mass., assignor, by mesne assignments, to American Stay Company, Boston, Mass., a corporation of Massachusetts

Original application November 17, 1932, Serial No. 643,037. Divided and this application December 6, 1934, Serial No. 756,343
1 Claim. (Cl. 91—68)

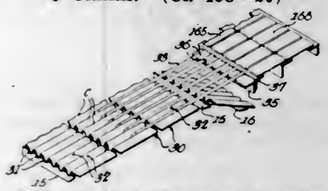


The method of making ornamented shoe trimmings and the like which comprises forming a thin narrow strip of flaccid leather or leather substitute having a coating of flaccid cellulose base material, operating upon said strip to place the material thereof under pressure in the direction of the thickness of said strip and, while under pressure, to place upon said coating a multitude of droplets of liquid cellulose base material, which latter is of contrasting color to said coating and contains a solvent therefor and is flaccid when dry, said droplets being arranged to form a sharply delineated design and being sufficiently closely spaced to unite with adjacent droplets upon relief of said pressure, relieving said pressure, and drying the united droplets.

2,098,970
ENVELOPE MACHINE

Abraham Novick, Flushing, N. Y., assignor to F. L. Smithe Machine Co., Inc., New York, N. Y., a corporation of New York

Application May 18, 1933, Serial No. 671,630
11 Claims. (Cl. 93—62)



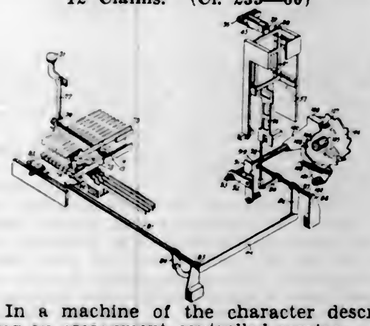
1. In a machine for making envelopes, said machine being of the type characterized by means for scoring the blank longitudinally and transversely, and by means for folding the side flaps of the blank; the combination of a rotatable member; a flap-folding means revoluble bodily therewith in an arcuate path conforming in part with the path of travel of the blank, said last-named flap-folding means being swingable in an arcuate path intersecting said first-named arcuate path, for folding an end-flap of the blank; and frictional conveying means for transporting said blank, after it has been acted on by said side flap folding means, to its arcuate path of

travel to be acted on by said end-flap folding means, the latter being adapted to accomplish the end flap fold irrespective of the normal error in registry imparted by the frictional feeding means.

2,098,971
CONVEYER

Frank P. Perkins, Waukesha, Wis., assignor to Michael Yundt Company, Waukesha, Wis., a corporation of Wisconsin

Application January 31, 1936, Serial No. 61,741
6 Claims. (Cl. 198—20)

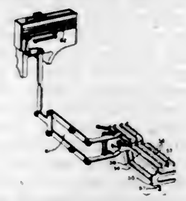


2. A device of the character described comprising a main conveyer including a plurality of cross members, each cross member comprising a metal body plate having adjacent portions alternately displaced in opposite directions to provide on the outer sides of the cross members article supporting surfaces and parallel, smooth and unobstructed grooves disposed between said surfaces, said grooves extending longitudinally of the conveyer with the grooves of one cross member alined with the grooves of the other, means connected with the inner sides only of said body plates for flexibly interconnecting the cross members and supporting and driving said main conveyer, an unloading conveyer at the discharge end of the main conveyer, a plurality of gap rods, one for each groove of the main conveyer, said gap rods extending between the discharge end of the main conveyer and the unloading conveyer, said gap rods having free ends projecting into and accommodated within the said grooves so as not to interfere with or present obstructions which would catch corners or other parts of articles traveling along the main conveyer, and means spaced from the free ends of said rods for supporting the rods so that articles pushed thereacross will be deposited on the unloading conveyer without catching upon any obstruction.

2,098,972
COMBINED TYPEWRITING AND COMPUTING MACHINE

Henry L. Pitman, Hartford, Conn., assignor to Underwood Elliott Fisher Company, New York, N. Y., a corporation of Delaware

Application December 31, 1936, Serial No. 118,618
12 Claims. (Cl. 235—60)

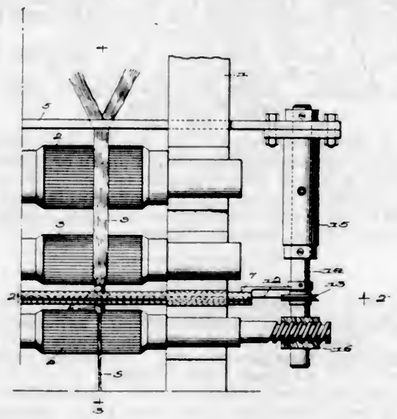


1. In a machine of the character described having an escapement-controlled carriage, a set of serially-operated indexable computing-wheel drivers and a set of indexing bars operatable from numeral keys; a mechanism controlled from the carriage for moving an operated indexing bar out of the path of a computing-wheel driver, said mechanism comprising a part adapted to be engaged by an operated indexing bar and a part adapted to be moved into the path of movement of the escapement-controlled carriage, and means connecting said parts for the transmission of movement in both directions.

2,098,973
PLURAL SELECTION ADAPTER FOR DELAY MECHANISM

Albert H. Reiber, Evanston, Ill., assignor, by mesne assignments, to Teletypesetter Corporation, a corporation of Delaware

Application March 4, 1935, Serial No. 9,136
22 Claims. (Cl. 199—18)



1. In a selecting mechanism, a group of primary selectable elements, a group of secondary selectable elements, each element of which is responsive to a code signal common to one or more of the elements of said primary group, a common motion recipient controlled by the elements of said secondary group, and a supervisory mechanism initiated by said common motion recipient for affecting the performance of an element relating to said primary group of selectable elements.

2,098,974
DRAFTING APPARATUS

George E. Repass, Gulfport, Miss.

Application July 16, 1934, Serial No. 735,466
9 Claims. (Cl. 19—154)

1. In drafting apparatus, the combination with a plurality of drafting rolls, of a tubular trumpet

bar located between adjacent rolls, trumpets each having opposite ends thereof journaled in opposite sides of said trumpet bar and having a tapered opening therethrough, and means extending longitudinally through the trumpet bar and having driving engagement with said trumpets for rotating said trumpets.

2,098,975

FURNITURE PAD

Willis D. Rich, Hingham, Mass.; Louise B. Rich administratrix of said Willis D. Rich, deceased

Application February 18, 1936, Serial No. 64,483

5 Claims. (Cl. 45—137)

1. A furniture pad comprising a setting having an opening through it, a cushion having edge engagement with the setting around the opening in it and protruding through said opening to rise above the setting, a flanged stud backing said cushion, the flange forming portion of the stud bearing against that portion of the cushion having edge engagement with the setting as aforesaid, the body of the stud protruding in part through said opening in the setting and over the face of which protruding portion of the stud said cushion is stretched, said cushion comprising normally a flat piece of cushion forming material larger than the flanged portion of said stud, the flanged portion of said stud being larger than the opening in the setting, the body of the stud being sufficiently smaller than the opening in the setting to carry the cushion with it when the body is projected through said opening, and means for forcing the stud to engage, in its flange forming portion, that portion of the cushion having edge engagement with the setting around the opening in it and to project, in its body portion, through the opening in the setting thereby distorting and carrying the cushion with it whereby the edge portion of the cushion will be bound to the setting and the projecting body portion thereof stretched over the face of said projecting body portion of the stud.

2,098,976

MEDICINAL PREPARATIONS CONTAINING METAL COMPOUNDS OF DECOMPOSITION PRODUCTS OF NUCLEOPROTEINS

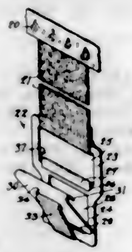
Simon L. Ruskin, New York, N. Y., assignor to Frances R. Ruskin, New York, N. Y.

No Drawing. Application November 2, 1933, Serial No. 696,390

8 Claims. (Cl. 167—68)

8. A medicinal preparation for the treatment of diseases by application to the human or animal body by injection comprising an isotonic solution of a compound of an isolated nucleotide and a metal of the group consisting of mercury, calcium, iron, gold, silver and aluminum.

2,098,977



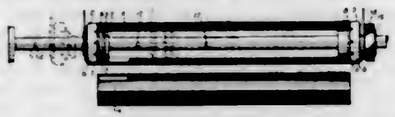
HOSE SUPPORTER

Charles L. Sellen, Seattle, Wash., assignor to Stuart D. Barker, Seattle, Wash.

Application February 1, 1935, Serial No. 4,554

8 Claims. (Cl. 24—243)

1. In a hose supporter, a frame member having a transverse bar; a hose engaging member having an upwardly extending hook like portion receiving a portion of a hose with the hose passing over the outside of the hook like portion and within the hook like portion and over the bar; and means resiliently connecting a lower portion of the frame member with the lower portion of the hose engaging member urging the said members angularly toward each other.



2,098,978

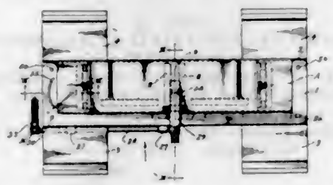
SPLIT PLATEN MOUNTING

John Q. Sherman, Dayton, Ohio

Application March 11, 1936, Serial No. 68,219

22 Claims. (Cl. 197—145)

20. A platen roll for a writing machine including a supporting shaft, a pair of concentric heads relatively adjustable on the supporting shaft for accommodating platen bodies of different lengths, and means for prelocating the heads on the shaft in accordance with the length of the platen body to be accommodated.



2,098,979

AUTOMOBILE BRAKE TESTER

Jacob L. Shroyer, Oak Park, Ill.

Application April 17, 1936, Serial No. 74,893

7 Claims. (Cl. 265—1)

2. A brake testing apparatus including a single movable platform adapted to receive a pair of automobile wheels thereon for testing the brakes thereof, means supporting said platform for bodily movement substantially perpendicular to its length and also for oscillatable movement about a central pivot, cooperating crank and cam means for moving said platform after said wheels are at rest thereon and the brakes thereof applied, means for actuating said crank means, said last mentioned means being provided with means for visually representing the force necessarily applied to said moving means to move said platform under the conditions stated, and means for indicating the amount of perpendicular and oscillatory movement of said platform.

2,098,980

YARN MANUFACTURE

Percy Frederick Combe Sowter, Spondon, near Derby, England, assignor to Celanese Corporation of America, a corporation of Delaware

No Drawing. Application January 14, 1933, Serial No. 651,847. In Great Britain February 5, 1932

6 Claims. (Cl. 19—1)

1. Process for the manufacture of imitation spun yarn, which comprises softening the whole of a bundle of filaments having a basis of an organic derivative of cellulose and stretching the softened bundle of filaments while in transit to such an extent that individual filaments are broken while the bundle still contains long lengths of unbroken filaments.

6. An imitation spun yarn which contains broken filaments having a basis of cellulose acetate and long lengths of unbroken filaments having a basis of cellulose acetate.

2,098,981

YARN MANUFACTURE

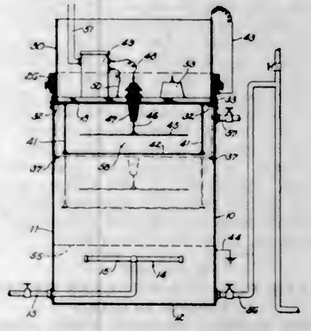
Percy Frederick Combe Sowter, Spondon, near Derby, England, assignor to Celanese Corporation of America, a corporation of Delaware

No Drawing. Application January 26, 1934, Serial No. 708,405. In Great Britain Feb. 15, 1933

18 Claims. (Cl. 19—1)

1. Process for the manufacture of imitation spun yarn, which comprises softening the whole of a bundle of artificial filaments and subjecting the softened bundle of filaments while in transit to an operation, such that individual filaments are broken while the bundle still contains long lengths of unbroken filaments.

17. An imitation spun yarn which contains broken artificial filaments and long lengths of unbroken artificial filaments.



2,098,982

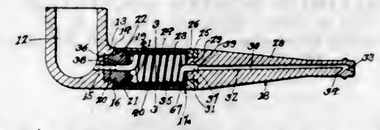
ELECTRIC DEHYDRATOR

Thomas N. St. Hill, San Marino, Calif., assignor to Petroleum Rectifying Company of California, Los Angeles, Calif., a corporation of California

Application September 11, 1934, Serial No. 743,533

14 Claims. (Cl. 204—24)

1. In combination in an electric treater: a tank containing a liquid; a vertically movable wall at the upper end of said tank; an electrode suspended from said wall to move vertically with said movable wall; and means for setting up an electric field adjacent said electrode whereby said electrode changes in vertical position with a vertical movement of said movable wall.



2,098,983

TOBACCO-USER'S APPLIANCE

Harold L. Uber, Jamestown, N. Y., assignor to Charles W. Dodge, Jamestown, N. Y.

Application September 14, 1934, Serial No. 744,056

4 Claims. (Cl. 131—12)

1. In a tobacco smoker's appliance, a structure of stem-like contour including a plurality of separably connected sections, smoke passages arranged in endwise spaced alignment and a portion of enlarged inner diameter intermediate its ends providing a chamber between the inner ends of said smoke passages, said chamber being formed with a pair of end walls, the inner ends of said smoke passages being flush with said end walls of and opening into said chamber, that part of said structure providing the said portion of enlarged inner diameter being formed with spaced wide elongated slots lengthwise thereof providing for a draft of cooling air through said chamber, and a smoke conducting member formed of a series of closely arranged tubular coils and oppositely extending tubular end terminal portions disposed axially with respect to and extending laterally from the end coils of said series of coils, said end terminal portions being arranged in said chamber and separably mounted in the opposed ends of said smoke passages, and said series of coils being arranged in said chamber.

2,098,984

DEHYDRO-STEROL COMPOUNDS AND MANUFACTURE THEREOF

Adolf Windaus and Friedrich Schenck, Gottingen, Germany, assignors to Winthrop Chemical Company, Inc., New York, N. Y., a corporation of New York

No Drawing. Application March 18, 1936, Serial No. 69,590. In Germany March 20, 1935

13 Claims. (Cl. 260—153)

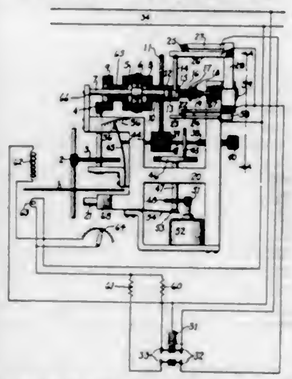
1. Dehydrosterol compounds selected from the group consisting of 7-dehydrocholesterol, 7-dehydrositosterol and 7-dehydrostigmasterol.

3. The process which comprises reacting upon an esterified sterol compound containing in ring II a keto group and a double bond in α, β-position thereto with an alcoholate of a metal selected from the group consisting of earth metals, zirconium and magnesium to reduce the 7-keto group to the 7-hydroxyl group, esterifying the hydroxyl groups of the reduction product, heating the diacyl compound formed to split off the acyl radical in the 7-position in the form of acid with the production of a 7-dehydro compound and saponifying the 7-dehydro-monoester compound.

2,098,985

7-HYDROXY-CHOLESTEROL

Adolf Windaus, Goettingen, and Friedrich Schenck, Wuppertal-Elberfeld, Germany, assignors to Winthrop Chemical Company, Inc., New York, N. Y., a corporation of New York

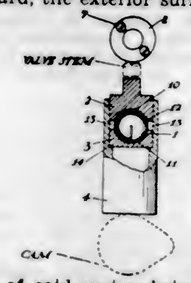


No Drawing. Application March 5, 1937, Serial No. 129,189. In Germany March 20, 1935

1 Claim. (Cl. 260—153)

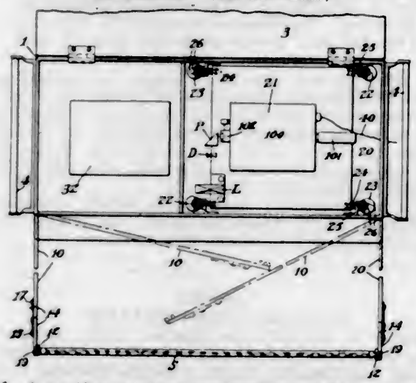
7-hydroxy-cholesterol, forming white crystals yielding an intensive blue coloration when heated on the water-bath with chloral hydrate, yielding

in the Salkowski reaction a blue coloration of the chloroform solution, forming in the form of its dibenzoate white crystals melting at 172.5–173.5° C.



2,098,986
MAXIMUM DEMAND REGULATOR
Ted Starling Winters, Albany, N. Y.
Application December 13, 1934, Serial No. 757,303
10 Claims. (Cl. 171—34)

1. In combination with a watthour meter, a frame adapted to be readily attached to said watthour meter, a differential gear driven by said watthour meter, a constant speed motor, a driving disc fixed to a vertical shaft and driven by said constant speed motor, a thrust bearing supporting said vertical shaft, a horizontal shaft, a driven disc fixed on said horizontal shaft and free to turn therewith, a spring supporting said thrust bearing and maintaining positive frictional contact between said driving and driven discs, a combined horizontal thrust bearing and micrometer screw, a second horizontal thrust bearing and a spring co-acting therewith, a scale and pointer indicating the axial position of said driven disc, a second differential gear driven by said horizontal shaft in a direction opposite to the first differential gear, a driven differential assembly having pinion engagement with said differential gears, a differential shaft fixed to said differential assembly and supporting freely thereon said differential gears, a friction clutch fixed to said differential shaft, an actuator supported by said differential shaft and co-acting with said friction clutch, normally closed contacts mounted on members of unequal length and disposed so as to be opened by said actuator, a rotatable arm and normally open contacts supported on said rotatable arm and disposed so as to be closed by said actuator.

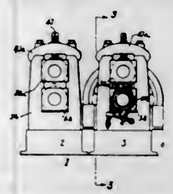


2,098,987
SELF-ADJUSTING MECHANISM
Eugene S. Witchger, Saginaw, Mich.
Application December 18, 1936, Serial No. 116,655
5 Claims. (Cl. 123—90)

1. An automatic tappet adjuster comprising co-axial cylindric members arranged end to end in spaced relation and adapted to be mounted for translatory movement with a tappet, means connecting said members to permit limited movement thereof endwise toward and away from each other, means preventing relative rotation of said members, adjacent ends of said members having lengthwise slot-like recesses whose inner peripheral walls present opposed concave bearing faces, a closely coiled annular resilient spring member of ribbon metal received between the said opposed bearing faces and normally tending to expand radially outward, the exterior surface of the outer

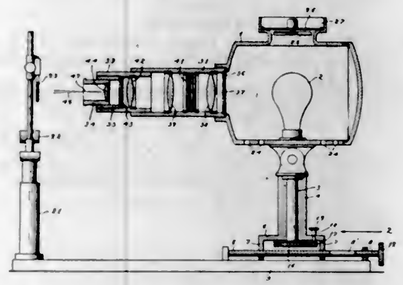
convolution of said spring being in sliding engagement with the said bearing faces, and stop means adjustably associated with said members to halt their movements away from each other.

2,098,988
PROJECTION DEVICE
Walter G. Wolfe, Greenwood, Mass.
Application December 21, 1934, Serial No. 758,637
12 Claims. (Cl. 88—16.2)



1. A motion picture projection outfit comprising a mobile compartmented stand having at one end a vertical pit, a projector mount vertically movable in said pit so as to be lowered within the pit or elevated to the surface thereof, counterweighted means for the raising and lowering of the mount, a projector on said mount and axially disposed at right angles to the line of screen projection, a pair of supports collapsibly mounted adjacent the stand sides and projectable forwardly thereof, a translucent screen detachably mounted on said arms at fixed focal projection distance, a wide angle projection lens mounted on the stand in the screen projection axis, and a prism reflector disposed between the projector and wide angled lens for deflecting the projected beam into the screen axis.

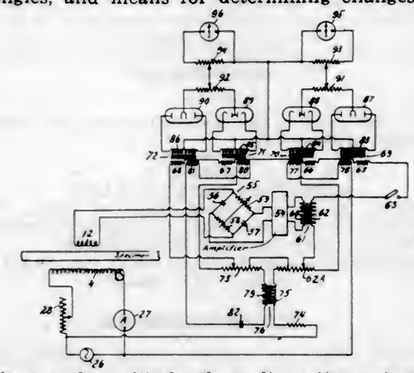
2,098,989
APPARATUS FOR AND PROCESS OF MAKING HOLLOW BODIES
Carl Minter Yoder, Lakewood, Ohio, assignor to The Yoder Company, Cleveland, Ohio, a corporation of Ohio
Application July 24, 1934, Serial No. 736,628. In France April 23, 1934, and in Great Britain April 23, 1934
42 Claims. (Cl. 113—33)



1. In apparatus for shaping sheet material supplied continuously, the combination of means for

feeding the material, means for severing the intermediate portion of the material on transverse lines spaced longitudinally thereof, sets of rolls for progressively shaping the material into a hol-

low body with its side edges in alined relation, and mechanism for severing the remaining portion of the material coincidently with the transverse severing lines.

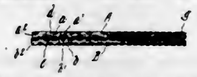


2,098,990
THERAPEUTIC LAMP AND METHOD
Phillip S. Newton, Oakland, Calif.
Application March 10, 1934, Serial No. 714,901
6 Claims. (Cl. 128—396)

6. A pathological treatment of the human eye which consists in projecting into the eye through the cornea thereof a divergent pencil of deep blue light having a wave length from substantially 3000 Å. to approximately 5000 Å. for a period of from approximately one-half to five minutes, removing the light from the eye for a period of from about one-half to one minute, and continuing said alternate periods of exposure and non-exposure for a period of approximately one-fourth to three-quarters of an hour daily.

2,098,991
MAGNETIC ANALYSIS
Theodor Zuschlag, West Englewood, N. J., assignor to Magnetic Analysis Corporation, a corporation of New York
Application April 23, 1936, Serial No. 75,945
8 Claims. (Cl. 175—183)

1. In a magnetic analysis apparatus the combination which comprises an exciter coil disposable in inductive relationship with a magnetizable body, means for energizing the exciter coil with an alternating current, a secondary coil disposed in inductive relationship with the exciter coil and connected to a circuit containing an adjustable phase shifter and means for introducing into the circuit a plurality of auxiliary alternating potentials of the same frequency as that supplied to the exciter coil but displaced from each other by substantially constant phase angles, and means for determining changes of

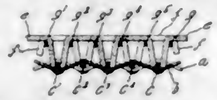


phase and amplitude of an alternating potential in said circuit.

2,098,992
PACKING
Joseph M. Bandish, Chicago, Ill.
Application January 14, 1935, Serial No. 1,658
4 Claims. (Cl. 288—1)

1. A packing having a substantially flat inner edge portion, a bore in said packing along said edge portion, and a hollow tube in said bore having a plurality of apertures in the side walls thereof, a number of said apertures being adapted to communicate with the interior of said packing, there being a slit in said packing between said bore and said inner edge, some of said apertures being adapted to communicate with said slit.

2,098,993
ASBESTOS FILLED DRIER FELT
William A. Barrell, North Andover, Mass., assignor to Lawrence Duck Company, Lawrence, Mass., a corporation of Massachusetts
Application August 15, 1935, Serial No. 36,291
8 Claims. (Cl. 139—426)

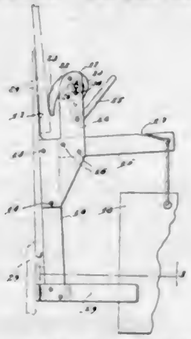


1. A drier felt comprising two plies of interwoven nonasbestos warp and asbestos filling, and binder warp strands crossing picks of the filling alternately in both plies, the asbestos of the filling being exposed between adjacent warp strands on both faces of both plies and parts of the filling strands in both plies being in contact forming substantially continuous absorbent wicks through both plies.

2,098,994
ASBESTOS-FACED DRIER FELT
William A. Barrell, North Andover, Mass., assignor to Lawrence Duck Company, Lawrence, Mass., a corporation of Massachusetts
Application August 15, 1935, Serial No. 36,292
7 Claims. (Cl. 139—426)

1. An asbestos-faced drier felt consisting of a woven body structure of non-asbestos fiber and cover strands consisting of a central body of loosely twisted asbestos fiber and an enclosing

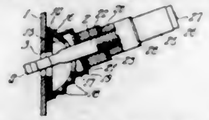
cage of fine threads interconnected with an open mesh, said cover strands extending side by side



over one face of the body structure and being connected therewith.

2,098,995
ASBESTOS TEXTILE YARN
William A. Barrell, North Andover, Mass., assignor to Lawrence Duck Company, Lawrence, Mass., a corporation of Massachusetts
Application July 8, 1936, Serial No. 89,514
6 Claims. (Cl. 96—26)

1. A composite asbestos yarn adapted for weaving consisting of an elongated body of asbestos fibers and a confining cage of strands smaller in diameter than the body extending around the body in two sets of helices of relatively opposite pitch, interbraided together, and spaced apart so as to leave openings of substantial width but of smaller dimensions than the length of the asbestos fibers.

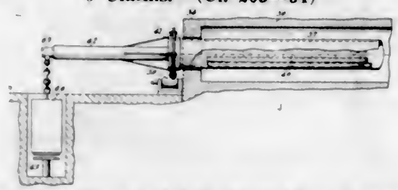


2,098,996
HANGER
Herman C. Blake, Hyde Park, Mass., and Samuel Blake, Richmond, Maine
Application October 27, 1936, Serial No. 107,858
4 Claims. (Cl. 248—218)

1. An improved hanger comprising in combination, a frame, a flat blade attached to said frame adapted to be inserted under a shingle or the like, a toothed jaw member pivoted in said frame, the toothed portion of said jaw member being oppositely opposed to said flat blade, a spring member located in said frame and engaging against the under side of said toothed member, a trigger pivoted in said frame and being adapted to engage the rear portion of said jaw member for the purpose of compressing the under side of the front portion of said jaw member against said spring member.

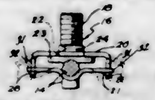
2,098,997
STUD
Carl Bramming, Gary, Ind., assignor to The Anderson Company, Gary, Ind., a corporation of Indiana
Application October 28, 1935, Serial No. 47,117
6 Claims. (Cl. 248—239)

1. In a supporting stud, the combination of a shank portion having a head adjacent one end thereof constructed to be insertable through a substantially circular aperture formed in a plate and engageable with the opposite side of said plate adjacent said aperture and at opposite sides thereof, said shank portion being adjustable angularly with respect to said plate, a spherically-



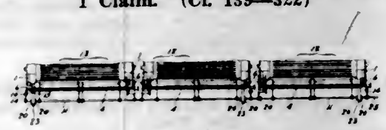
shaped washer surrounding said shank portion at the opposite side of said plate from said head, and means operatively related to said shank portion and washer for securing the stud in fixed relation at various angles of adjustment with respect to said plate.

2,098,998
RATION
William Henry Brinton, near Coatesville, Pa.
No Drawing. Application November 3, 1933, Serial No. 696,537
3 Claims. (Cl. 99—1)



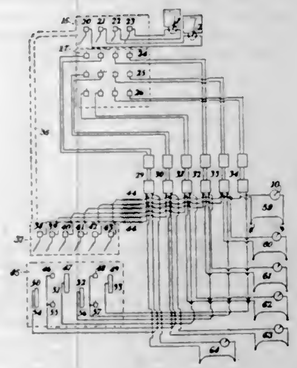
1. A food ration including feeding oil and feeding bone meal with artificial iodization of the meal.

2,098,999
FURNACE
Roger Stuart Brown, Upper Montclair, N. J., assignor of one-half to Bertram J. Sayles, Pittsburgh, Pa.
Application December 21, 1935, Serial No. 55,639
6 Claims. (Cl. 263—34)



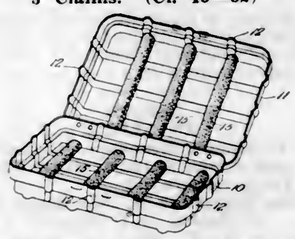
1. In a furnace, a tubular retort, bearings supporting the retort for rotation, a shaft extending axially from at least one end of the retort, and a counterweight suspended therefrom.

2,099,000
SWIVEL HARP FIXTURE
Edward W. Carpenter, Fairfield, Conn., assignor to The E. W. Carpenter Manufacturing Company, Bridgeport, Conn., a corporation of Connecticut
Application August 4, 1936, Serial No. 94,186
5 Claims. (Cl. 240—148)



1. In a swivel harp fixture for a lamp, a harp frame, and a shade support mounted to swivel on said frame comprising a plate at one side of a portion of said frame, a shade securing stud carried by and extending through said plate and provided with a shoulder at the inner side of the plate, the inner end of the stud being provided with a transverse groove in which the frame is seated, a spring plate on the opposite side of the frame from the first plate, and means securing the spring plate to the first plate and tensioning said spring plate to clamp the stud and this latter plate on opposite sides of the frame.

2,099,001
MULTIPLE-JACQUARD MOTION
Marice Childs, Philadelphia, Pa., assignor to George T. Downs, Philadelphia, Pa.
Application April 12, 1935, Serial No. 15,959
1 Claim. (Cl. 139—322)



In combination with a battery of Jacquard loom card cylinders and their steadier brackets, said brackets having flanges thereon, sprockets on the ends of the card cylinders, a shaft parallel with the longitudinal axes of the card cylinders, brackets consisting of longitudinally adjustable sections, one section of each bracket being connected for vertical adjustment on said flanges, the other sections of said brackets having adjustable eccentric bushings in their outer ends providing bearings for the shaft, means for holding the bushings in various positions of adjustment, sprockets fixed to the shaft and aligned with the sprockets of the cylinders, driving belts trained around the aligned sprockets, and means for rotating the shaft, as and for the purpose set forth.

2,099,002
ELECTRICAL MEASURING SYSTEM
William Gordon Crocker, Kent, England, assignor to Callender's Cable and Construction Company, Limited, London, England, a British company
Application March 11, 1935, Serial No. 10,540
In Great Britain March 20, 1934
1 Claim. (Cl. 171—95)

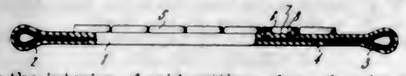
In an apparatus for electrically measuring the value of the electrical commodity in several electrical circuits which can be switched singly and temporarily into connection with a main measuring instrument, the combination with the switching means of an additional measuring instrument in each of said circuits, several impedances, each equal to the impedance of the main instrument, and means operatively associated with said switching means for connecting separately with each of said circuits one of the said impedances while each of said circuits is disconnected from the main instrument.

2,099,003
TACKLE BOX
William J. De Witt and Paul A. Ross, Auburn, N. Y., assignors to Shoe Form Co., Inc., Auburn, N. Y., a corporation of New York
Application February 19, 1937, Serial No. 126,609
3 Claims. (Cl. 43—32)

1. A tackle box comprising a base and cover, having, in the bottom wall of the base and top wall of the cover, corrugations which form transversely extending grooves and bars mounted in said grooves, said bars being adapted to engage the hooks of flies and hold them in position.

2,099,004
MANUFACTURE OF MATERIALS CONTAINING PIGMENTS
Henry Dreyfus, London, England
No Drawing. Application June 17, 1933, Serial No. 676,336. In Great Britain July 4, 1932
11 Claims. (Cl. 106—40)

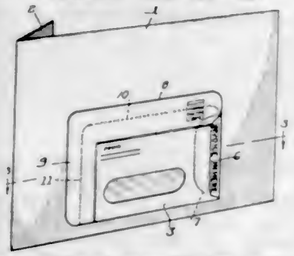
9. A spinning solution for the manufacture of artificial filaments, threads, yarns, ribbons, films and like materials by dry spinning processes which comprises cellulose acetate, a volatile organic solvent therefor and fine particles of an inorganic pigment which has been heated at 200 to 500° C. under a pressure of less than 50 cms. of mercury.



2,099,005
PRODUCTION OR TREATMENT OF ARTIFICIAL FILAMENTS, THREADS, YARNS, RIBBONS, AND THE LIKE
Henry Dreyfus, London, England
No Drawing. Application June 17, 1933, Serial No. 676,337. In Great Britain July 19, 1932
10 Claims. (Cl. 8—20)

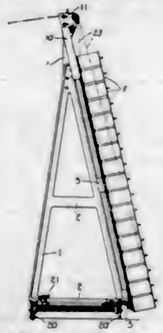
1. In a process for the treatment of formed artificial filaments, yarns, threads, ribbons, foils, films and like products comprising organic derivatives of cellulose, the steps of softening said materials by the action of a liquid medium containing a non-solvent for the cellulose derivative and a high concentration of a volatile solvent therefor, in the presence of a low concentration of a less volatile solvent for the cellulose derivative having a lower vapor pressure than that of the non-solvent employed and subjecting the softened material to a stretching operation.

2,099,006
TIRE ANTISKID DEVICE
Ernst Eger, Grosse Pointe Park, Mich., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware
Application June 11, 1936, Serial No. 84,649
3 Claims. (Cl. 152—14)



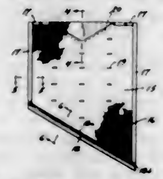
1. An antiskid unit comprising a cup-shaped metallic member presenting a cutting edge to a road surface, an external rubber composition covering for the member bonded thereto, said covering being externally unconfined near said cutting edge to permit the rubber composition adjacent to said edge to move relatively thereto,

and a body of bonded rubber composition disposed internally of and incompletely filling the member and forming a thin internally unconfined covering



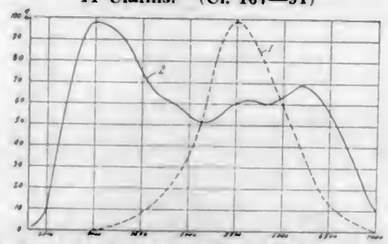
for the interior of said cutting edge, whereby the rubber composition adjacent to said edge may be distorted sufficiently to permit the edge to have a cutting engagement with a road surface.

2,099,007
ENVELOPE
Charles F. Elmore, Evanston, Ill., assignor, by direct and mesne assignments, to Pilot Letter Label Co., a corporation
Application September 23, 1935, Serial No. 41,680
8 Claims. (Cl. 229—72)



1. As an article of manufacture, means in the form of a paper label or paster having two walls forming between them a relatively small compartment in fixed position on the outside surface of an envelope, or of a box or package, having a plurality of gummed single thickness edge portions for pasting to said surface outside the area of said compartment, either before or after the label or paster is filled and closed, and a single entrance only for a letter or other enclosure, at one edge of said compartment, with a single thickness closing flap integral with one edge of the inner wall of said compartment and extending in open position at the back of the enclosure while the latter is being inserted back of the front wall of said compartment through said entrance.

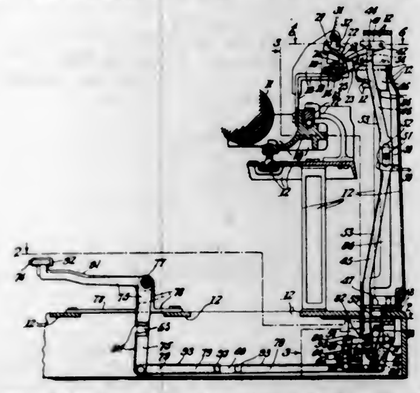
2,099,008
CREEL FOR ARTIFICIAL YARNS
William John Elvin, Ralph Herman Balch, and William Whitehead, Cumberland, Md., assignors to Celanese Corporation of America, a corporation of Delaware
Application October 3, 1934, Serial No. 746,654
3 Claims. (Cl. 242—131)



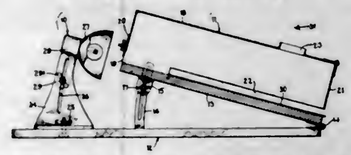
3. In a device for warping yarns formed of an artificial material, the combination with a bank of spindles in parallel relationship adapted to rotatably support a plurality of packages, of rotatable means positioned above the bank for directing yarns drawn from the packages directly to a point in a line, which line is in a plane drawn through the centers of the packages, and brackets for adjustably supporting the rotatable means.

2,099,009
HUMIDIFYING SYSTEM AND APPARATUS
Walter H. Finley and Charles H. Hamilton, Nashville, Tenn.
Application November 13, 1935, Serial No. 49,529
5 Claims. (Cl. 261—103)

1. A humidifying element adapted for use between spaced radiator surfaces, comprising a laminated body of absorbent material in sheet form, the sheets of which are adapted to be spread apart at one edge of the body to provide a water pocket, and a reinforcing metal retainer for the body, having a multiplicity of vapor discharge openings.



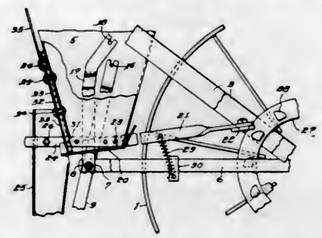
2,099,010
PHOTOGRAPHIC MAKE-UP
Max Firestein, Beverly Hills, and Steven Ferentzy, Los Angeles, Calif., assignors to Max Factor & Co., Los Angeles, Calif., a corporation of Delaware
Application June 8, 1936, Serial No. 84,068
11 Claims. (Cl. 167—91)



2. A cosmetic preparation of the character described and adapted for use on humans to be photographed on panchromatic type emulsions; said cosmetic containing white and colored pigments in quantity and proportion sufficient to impart to said cosmetic a high reflection coefficient to wave lengths of about 6200 to 6500 Å. and lower coefficients to shorter wave lengths of light, the reflection coefficient to wave lengths within the range 4000 to 4500 Å. being 45% to 75% of the reflection coefficient to wave lengths within the range 6200 to 6500 Å.

2,099,011
TYPEWRITING MACHINE
Carl Gabrielson and Charles Waucquez, Syracuse, N. Y., assignors to L. C. Smith & Corona Typewriters, Inc., Syracuse, N. Y., a corporation of New York
Application May 11, 1936, Serial No. 79,028
13 Claims. (Cl. 197—179)

2. A typewriting machine having a tabulating mechanism comprising a series of traveling columns stops each comprising a toothed sector and pivoted to rock independently of all the others about an axis parallel to the path of travel of the series of stops into inoperatively and operatively set positions, a non-traveling stop setter pivoted to rock about an axis parallel to the path of travel of the series of stops and normally urged into an idle position in which the stops are successively registrable therewith, whether operatively or inoperatively set, with said setter extending into a given tooth space of the registered stop which is the same for all stops, said stop setter when shifted in different directions from idle position and returned thereto being adapted to set a stop registered therewith in different ones of its set positions and leave it there.

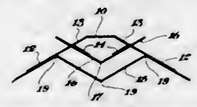


2,099,012
OPTICAL TESTING
Albert S. Goodrich and Charles R. Tait, Erie, Pa., assignors to Hammermill Paper Company, Erie, Pa., a corporation of Pennsylvania
Application May 29, 1935, Serial No. 24,042
9 Claims. (Cl. 88—14)

1. Apparatus for inspecting material having a relatively flat surface comprising, supporting means for said material, means for directing light in only one direction along said surface and substantially parallel thereto, means for varying the angle at which the light strikes said surface, and means for shielding said surface from other light sources but enabling said surface to be observed in a direction transverse to said light.

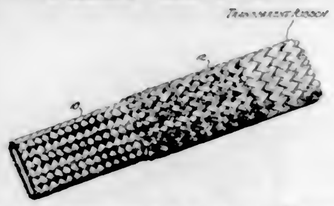
2,099,013
FERTILIZER DISTRIBUTOR
Charles Wellington Haagen, Philadelphia, Pa., assignor to S. L. Allen & Co., Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application September 23, 1936, Serial No. 102,117
6 Claims. (Cl. 111—76)

1. The combination with a fertilizer distributor comprising a ground wheel, a hopper open at its bottom and having a discharge opening adjacent the lower end of its rear wall, a horizontally pivoted agitating pan underlying the end of the hopper, and means cooperative with the ground wheel normally operative to oscillate the pan about its pivot when the wheel is turned in a predetermined direction, of a gate slidable against the rear wall of the hopper toward and away from the pan, an operating lever pivoted to said wall for movement from one limit position to another, and a link interposed between the gate



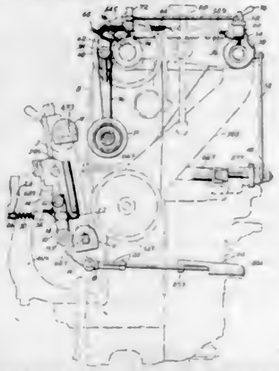
and lever and adjustable on the latter relatively to its pivot to determine the position of the lower edge of the gate with respect to the discharge opening when the lever is in one of said positions, the gate in any adjusted position of the link being adapted to depress the pan through a predetermined arc when the lever is thrown to its other limit position to thereby move the pan oscillating means out of cooperative relation with the ground wheel and to close the opening.

2,099,014
METHOD OF PRODUCING VANILLIN FROM WASTE SULPHITE LIQUOR
Raymond S. Hatch, Longview, Wash., assignor to Weyerhaeuser Timber Company, Tacoma, Wash., a corporation of Washington
No Drawing. Application June 27, 1936, Serial No. 87,809
6 Claims. (Cl. 260—137)



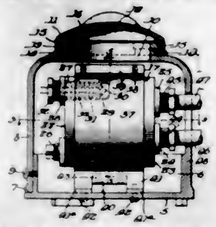
1. The process of producing vanillin from waste sulphite liquor which comprises adding to the liquor an alkaline agent in an amount sufficient to afford at the conclusion of the reaction a pH of about 13, and heating the mixture to a temperature of from 180° C. to 220° C. for a period not exceeding thirty minutes.

2,099,015
CARDBOARD DISPLAY DEVICE
John V. Horr, Hastings-on-Hudson, N. Y., assignor to Einson-Freeman Co., Inc., Long Island City, N. Y., a corporation of Delaware
Application December 30, 1936, Serial No. 118,193
19 Claims. (Cl. 40—126)



1. In a cardboard display device of the character described, a series of successively longer display cards each of which comprises hinged sections arranged side-by-side in zigzag relation, said cards being arranged in superposed stepped tiers with each card above the next longer one, and a backing for interconnecting and supporting said cards as a collapsible unit, each section depicting a commodity such as a bottle and the unit thus simulating a pyramidal stack of said commodities.

2,099,016
COMPOSITE STRAND
Donald M. Houghton, Newton, Mass., assignor, by mesne assignments, to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application August 2, 1935, Serial No. 34,406
2 Claims. (Cl. 96—25)



1. A strand comprising a plurality of telescoped tubular braids, the outer braid being transparent.

2,099,017
MACHINE FOR OPERATING UPON SHOE PARTS
Cyril Harry James and William Isaac Bacon, Leicester, England, assignors to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application March 11, 1935, Serial No. 10,360
In Great Britain March 22, 1934
13 Claims. (Cl. 51—145)

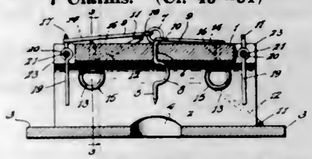
1. A machine for operating on heels and like articles, comprising an operating tool, a work holder, a support for said work holder, a pivotal mounting for said support constructed and arranged for tilting movement about one axis to enable said work holder to swing toward and from said operating tool and about another axis extending transversely of the first-mentioned axis to enable said work holder to assume varying angular aspects of presentation with respect to said operating tool, an abutment, means on said support engageable with said abutment to control the angular position of said support about both of said axes, and resilient means tending to urge said support into a position wherein a work piece in said work holder engages the operating tool and wherein said position-controlling means engages said abutment, said abutment being movable to cause said support to move about the first-mentioned axis in opposition to said resilient means into a position wherein the work piece is remote from the operating tool to facilitate replacement of the work piece, said abutment and said means engageable therewith serving to control the angular position of the support about the second-mentioned axis upon movement of the support into operating position under the influence of said resilient means, whereby the replaced work piece is presented to the operating tool in controlled angular position.

2,099,018
FLUID HEATER
John F. Kennedy, Evanston, Ill.
Application May 14, 1934, Serial No. 725,423
19 Claims. (Cl. 219—39)

1. In a fluid heater, a heat conducting shell or casing having concentric cylindrical walls joined by annular end walls and an interior longitudinal partition, forming a circuitous fluid passageway and provided with an inlet and an outlet, and a heating element surrounding said casing.

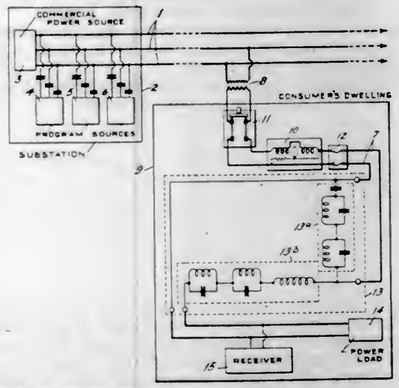
2,099,019
PIGMENTS AND METHODS OF MAKING SAME
Charles J. Kinzie, Niagara Falls, N. Y., assignor to The Titanium Alloy Manufacturing Company, New York, N. Y., a corporation of Maine
No Drawing. Application May 2, 1934, Serial No. 723,504
6 Claims. (Cl. 134—58)

6. In the method of making a pigment containing zirconium, the step which consists in adding to a base pigment a solution of zirconium containing acid-soluble compounds of silicon and soluble salts of a metal in the group consisting of barium, sodium and potassium, and also containing a readily water-soluble organic compound selected from the group consisting of tartaric acid, citric acid and sodium zirconium tartrate, and effecting a precipitation therefrom of the zirconium and silicon compounds on the particles of the base pigment.



2,099,020
WIREMOLD LUMILINE REFLECTOR
Arthur O. La Ducer, Hartford, Conn., assignor to The Wiremold Company, Hartford, Conn., a corporation of Connecticut
Application December 24, 1935, Serial No. 55,956
7 Claims. (Cl. 240—6)

1. The combination of a plurality of line lamps arranged in line with each other, sockets for said lamps, a series of elongated reflector members of curved cross-section arranged in line with each other and with their longitudinal axes parallel to the axes of the lamps, the ends of said reflector members having a series of twist-outs removable

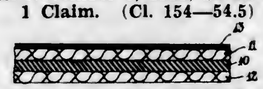


to accommodate said lamp sockets with the reflector members mounted in any one of a plurality of angular positions, and means for holding the reflectors in place with their ends in substantial contact at any one of a plurality of angular positions.

2,099,021
RODENT TRAP
George M. Landes, Webb City, Mo.
Application February 24, 1936, Serial No. 65,500
7 Claims. (Cl. 43—81)

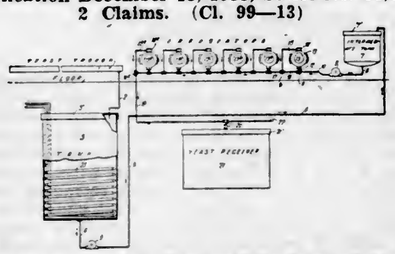
1. A trap comprising a housing having a longitudinally extending passage opening through its ends and an opening in its bottom intermediate the length of the passage, a bait holder in said passage over the lower opening having a mounting portion extending upwardly through the top of the housing and being formed with an eye, jaw retainers carried by said eye, jaws carried by said housing and movable from a lowered position about the ends of the housing to a raised position over the top of the housing, the jaws being yieldably held against upward movement, and triggers carried by said housing adjacent the ends of the passages with portions disposed over the housing for engaging the free end portions of the jaw retaining elements and other portions extending downwardly into the passage and adapted to be engaged by animals entering the passage and moving the triggers to release the jaw retainers.

2,099,022
TRANSMISSION SYSTEM
Irwin B. Levine, New York, N. Y., assignor to Wired Radio, Inc., New York, N. Y., a corporation of New York
Application March 7, 1936, Serial No. 67,630
1 Claim. (Cl. 179—2.5)



A transmission system comprising, a commercial power distribution network, a consumer's circuit connected to said network and including a power load and a wired radio receiver, means for impressing program modulated carrier frequency energy upon said network, said network, in combination with said consumer's load operating to produce a gradient attenuation of said carrier frequency energy, a transducing network connected in said consumer's circuit for permitting the passage therethrough of said commercial power while effecting a transducing operation to compensate for said attenuation gradient to effect an increased signal power level of uniform characteristics at said consumer's receiver.

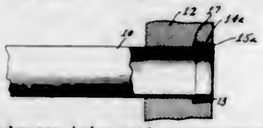
2,099,023
FLUORESCENT SUBSTANCES
Leonard Angelo Levy and Donald Willoughby West, London, England, assignors of one-half to Ilford Limited, Ilford, Essex, England, a British company
No Drawing. Application June 28, 1934, Serial No. 732,828. In Great Britain July 11, 1933
4 Claims. (Cl. 250—34)



1. A fluorescent screen for X-ray purposes made up from fluorescent material free from undesirable after-phosphorescence and the retention of latent image and containing fluorescent zinc sulphide obtained by precipitation in a high degree of purity as the essential fluorescent component and a proportion of not more than one part of nickel in five hundred thousand parts of zinc sulphide as the component which acts to eliminate the after-phosphorescence and retention of latent image.

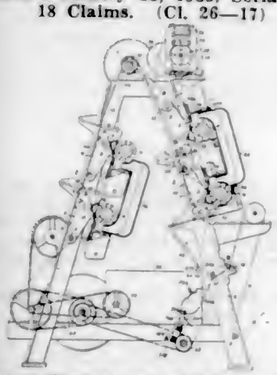
2,099,024
DRAW SHEET FOR ROTARY PRINTING PRESSES
Robert R. Lewis, Baldwin, N. Y., assignor to Vulcan Proofing Company, New York, N. Y., a corporation of New York
Application November 8, 1933, Serial No. 697,101
1 Claim. (Cl. 154—54.5)

A draw sheet comprising fabric layers having an intermediate resilient layer which connects said fabric layers, one of said fabric layers having an oil-repellent coating which serves to protect said resilient layer as well as the blanket over which the draw sheet fits, the thickness of said draw sheet not substantially exceeding .030 inch.



2,099,025
PROCESS FOR TREATING LIQUID YEAST
Robert F. Light, Mount Vernon, Charles N. Frey, Scarsdale, and Gerhardt J. Patitz, Peekskill, N. Y., assignors to Standard Brands Incorporated, New York, N. Y., a corporation of Delaware
Application December 13, 1935, Serial No. 54,222
2 Claims. (Cl. 99—13)

2. A process for the manufacture of yeast which comprises separating live yeast as a suspension having a yeast concentration of 30 to



50% from liquid in which it was propagated, cooling, subjecting the live yeast in the form of discrete particles in liquid suspension containing liquid in which it was grown and at a temperature not exceeding 16° C. to the influence of ultra-violet rays of the range 2300–4000 A. U. in a closed system in the substantial absence of oxygen and at a rate of about 6 gallons per minute, agitating while under the influence of said rays whereby yeast cells of uniform potency are obtained, and subsequently forming into pressed yeast.

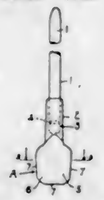
2,099,026
CONDENSER TUBE SEAL
Orville Markel, Chicago, William H. Phillips, Oak Park, and Joseph M. Bandish, Chicago, Ill.
Application May 15, 1936, Serial No. 79,876
4 Claims. (Cl. 285—56)

1. A condenser tube seal comprising in combination with tubes and tube sheets, the latter having counterbored apertures to receive the ends of the tubes, bushings expansible into the counterbores of the tube sheet apertures, said bushings having inclined channels therein into which the tube ends are adapted to be flared by forcing the bushings over the tube ends.

2,099,027
FABRIC SHEARING MACHINE
George H. Mason, Glen Rock, and John S. Shand, Paterson, N. J., and Clarence N. Johnson, New Brighton, N. Y., assignors to Hermas Machine Company, Hawthorne, N. J., a corporation of New Jersey
Application February 18, 1935, Serial No. 6,960
18 Claims. (Cl. 26—17)

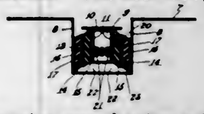
5. In a cloth-shearing machine, the combination, with supporting structure and a shearing unit and a cloth-rest unit arranged therein, of means to move one of said units from and toward the other including a reversible motor having the driven part thereof forming with the latter unit a driven system, a normally retracted switch movable to one position to direct energy to the motor for driving its driven element forward and to another position for driving said element reversely, means, controlled from the moving cloth, to move the switch to and hold it in the first position and then move it to and hold it in the second position, and means, actuated by said system between and after said movements of the switch, to cause the second-named means to release the switch.

2,099,028
FINGER PRINT POWDER
Justin J. McCarthy, Boston, Mass.
No Drawing. Original application March 14, 1935, Serial No. 11,105. Patent No. 2,028,619, dated January 21, 1936. Divided and this application November 29, 1935, Serial No. 52,070
6 Claims. (Cl. 134—38)



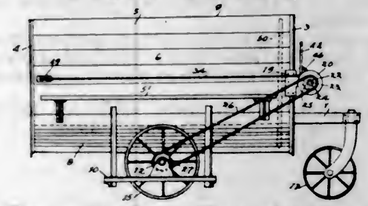
4. A finger print powder comprising hydroquinone, and a water soluble gum, the said hydroquinone exceeding the said water soluble gum in said powder by weight.

2,099,029
TAG
Edgar J. McKay, Short Hills, N. J.
Application October 8, 1936, Serial No. 104,569
5 Claims. (Cl. 229—74)



1. A tag of the character described having a body portion, a section at one end integral therewith, and substantially wider than said body portion, said section being folded backwardly about the bottom edge of the body portion and inwardly along lines oblique to the bottom edge whereby a pocket is formed by said folded section.

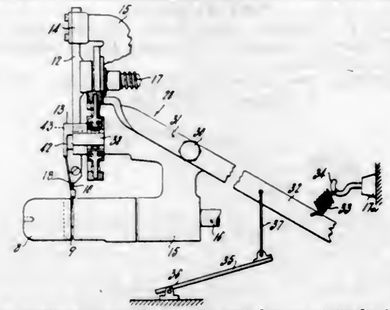
2,099,030
METHOD OF APPLYING PAINT
Charles C. Morrison, Easton, Pa., assignor to Binney and Smith Co., New York, N. Y., a corporation of New Jersey
Application April 10, 1935, Serial No. 15,552
4 Claims. (Cl. 41—26)



3. A method of producing artists' pictures from plastic paint or similar material, said method including producing artists' picture elements by drawing a small non-running mass of the plastic paint along a path on a picture receiving surface with brush like strokes, while exerting upon the upper face of the mass a firm yielding pressure throughout a continuous area of said face and across the path of the mass while maintaining the mass at said smooth area entirely beneath the face; said pressure at closely adjacent points being substantially independently firmly elastic and substantially continuous across said path, the pressure being longitudinally extended along spaced parallel intra-marginal longitudinal line portions of the path being sufficiently firm to squeeze the material to form a thin layer of desired thickness at said line portions, the pressure between said line portions being also longitudinally extended, and forming parallel longitudinal ridges of paint thicker than at said line portions.

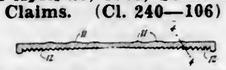
2,099,031
RESILIENT SUPPORT
John F. Neal and Walter M. Haessler, St. Louis, Mo.
Application January 7, 1935, Serial No. 679
3 Claims. (Cl. 105—197)

1. Vehicle running gear having a transom and a bolster with a pair of resilient devices interposed between the bolster and the transom for resisting vertical, lateral and longitudinal stresses and means for applying a variable compression to said devices.



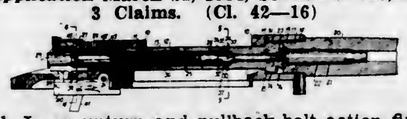
2,099,032
AGRICULTURAL IMPLEMENT
Philip Penn, Winnipeg, Manitoba, Canada, assignor to Lion Agricultural Implements Limited, Winnipeg, Manitoba, Canada
Application February 29, 1936, Serial No. 66,427
5 Claims. (Cl. 214—82)

1. The combination with a wheeled vehicle embodying a load receiving receptacle, of a vertically disposed transversely extending ejector mounted in the receptacle for fore and aft movement, pairs of clutch controlled winding drums connected by suitable flexible cables to the front and rear sides of the ejector, one pair of drums operating to wind their cables as the remaining pair unwind and means for selectively driving selected drums of the pairs, said means deriving its power from the movement of the vehicle over the field.



2,099,033
TRIMMING MACHINE KNIFE GUARD SUPPORTING AND OPERATING MECHANISM
Herbert R. Polleys, New Haven, Conn., assignor to United States Rubber Products, Inc., New York, N. Y., a corporation of Delaware
Application November 13, 1935, Serial No. 49,548
5 Claims. (Cl. 12—51)

1. In a rubber shoe trimming machine, a mechanism for operating a knife guard, comprising a movable support secured to said guard, means for normally resiliently holding said guard in a predetermined relation with the surface of the work; means for moving said guard in opposition to said resilient holding means and adjustable

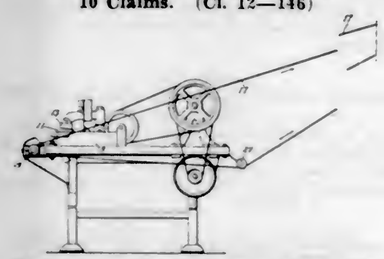


stops acting upon said support for positively limiting the movement of said guard toward and away from said work.

2,099,034
REFRACTOR
Thomas W. Rolph, Newark, Ohio, assignor to Holophane Company, Inc., New York, N. Y., a corporation of Delaware
Application April 25, 1935, Serial No. 18,086
8 Claims. (Cl. 240—106)

1. A refractor for altering the divergence of light rays, said refractor having a substantially continuous surface on the light incident side and a series of parallel prisms on the opposite side, the light incident side having comparatively small, spaced apart areas departing from the otherwise continuous surface, said areas being elongated in directions transverse of the opposed prisms and of curved cross section longitudinally and transversely for diverging light incident on each area in directions parallel with the minor axis of said area and without substantially affecting the converging of light rays by the opposed prisms in directions parallel with the major axis of said area.

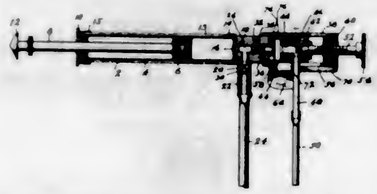
2,099,035
UPTURN-AND-PULLBACK BOLT-ACTION FIREARM
Arthur A. Rowley, Hamden, Conn., assignor to Winchester Repeating Arms Company, New Haven, Conn., a corporation of Maryland
Application March 21, 1934, Serial No. 716,588
3 Claims. (Cl. 42—16)



1. In an upturn-and-pullback bolt-action firearm, the combination with the bolt thereof; of a firing-plunger reciprocatable in said bolt and projectable from the rear end thereof; and two complementary interengaging safety-abutments, one of which is in the form of a transverse pin carried by and supported at each of its respective opposite ends in the said bolt and the other of which is of sloping form and carried by the said firing-plunger and positioned so as to interengage when and only when the said firing-plunger is moved rearwardly beyond its cocked position, to thereby guard against the rearward ejection of the said firing-plunger from the said bolt under the urge of a ruptured cartridge-primer.

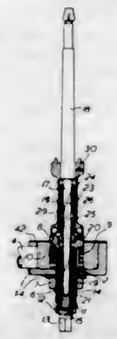
2,099,036
POWER TRANSMITTING AND LUBRICATING MECHANISM
Daniel R. Scholes, Oak Park, Ill., assignor to Aermotor Company, Chicago, Ill., a corporation of Illinois
Application December 29, 1933, Serial No. 704,428
3 Claims. (Cl. 184—4)

1. In mechanism of the class described, a hollow stationary member, a tubular member slidable longitudinally into said hollow stationary member, a bearing fixed in said tubular member near one end, a second bearing fixed in said tubular member near the other end and having a lateral opening therethrough, a longitudinal slot extending along the upper edge of the tubular member from one end to near the other, an oil collector socket fixed near one end of the hollow stationary member and having a head extending a slight distance into the interior thereof, said head being fitted into a depressed seat to hold its sides parallel with said slot, said head being of a width slightly less than that of the slot, whereby the tubular member with its bearings may be inserted longitudinally into the hollow stationary member with the sides of the slot moving by the sides of said head until the end of the slot strikes the head, the head insuring that the tubular member can be inserted in only one position and held against rotation.



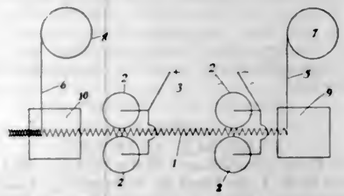
2,099,037
METHOD OF MAKING SHOE STIFFENERS
Bruno Ernst Schwarz, Barcelona, Spain, and Floyd Dudley Dean, Leicester, England, assignors to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application March 16, 1934, Serial No. 715,960
In Great Britain March 23, 1933
10 Claims. (Cl. 12—146)

1. The method of preparing shoe stiffeners which comprises impregnating porous, absorbent blanks with a solution of a cellulosic stiffening substance containing more than 20% by weight of the substance and having a viscosity sufficiently low to permit it readily to permeate the blanks, and packing the stiffeners while soft and pliable in sealed containers ready to be removed and placed without further treatment in the uppers of boots and shoes.



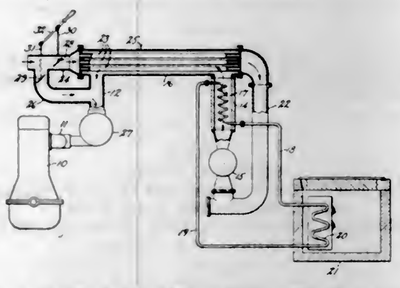
2,099,038
MILK TESTING DEVICE
John Rapp Shikles, Dearborn, Mo.
Application September 16, 1935, Serial No. 40,769
1 Claim. (Cl. 73—51)

A device of the character described comprising a pump having an inlet and discharge opening at one end, a stationary clamp member connected to said pump and provided with an inlet nipple extending at right angles thereto, said clamp member and nipple having a duct extending therethrough and communicating with the inlet and discharge opening in the pump, an inlet valve in the nipple and a discharge valve in the clamp member, a movable clamp member having a discharge nozzle extending at right angles thereto and a duct communicating with said nozzle and the discharge end of the first-mentioned



duct, respective tubes depending from the nipple and the nozzle, a tubular holder connected at one end to the stationary clamp member and in which the movable clamp member is slidably mounted, said tubular holder having a longitudinal slot through which the discharge nozzle projects, and an element threaded in the other end of the tubular member and adapted to adjust the movable clamp member longitudinally and thereby clamp or release a filter strip extending between the clamp members.

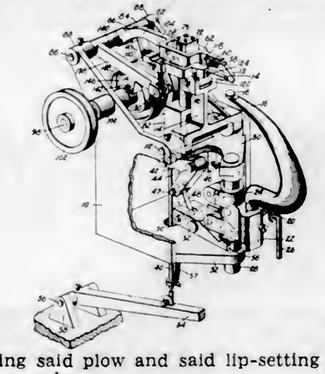
2,099,039
LUBRICATION OF TWISTING SPINDLES USED IN YARN AND LIKE WINDING MACHINERY
William Ivan Taylor and Alfred Herbert Woodruff, Spondon, near Derby, England, assignors to Celanese Corporation of America, a corporation of Delaware
Application June 18, 1936, Serial No. 85,950
In Great Britain July 2, 1935
6 Claims. (Cl. 184—104)



1. Yarn or like twisting device comprising a channel rail, a spindle bolster, a shoulder on the bolster, a perforated tubular member surrounding and spaced from the bolster beneath the shoulder to provide a support for the bolster in the channel, a recess for spindle lubricant within the bolster, and means in the rail for providing for the passage of cooling medium into and out of the channel.

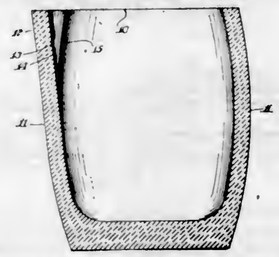
2,099,040
MANUFACTURE OF METALLIC TUBING
Rene Tondeur, London, England
Application July 26, 1935, Serial No. 33,287
In Great Britain July 30, 1934
8 Claims. (Cl. 29—156)

1. Process for the production of flexible tubing composed of multiple interwound coils, which consists in coiling or winding a leading wire while this is in a soft condition, then heat-treating and hardening the wire to the desired degree of hardness, and then introducing between the windings of the leading wire or wires an already tempered following wire or wires.



2,099,041
REFRIGERATION
Hugo M. Ulistrand, Evansville, Ind., assignor to Servel, Inc., New York, N. Y., a corporation of Delaware
Application July 9, 1936, Serial No. 89,706
5 Claims. (Cl. 62—139)

1. A method of refrigeration with the aid of an internal combustion engine which consists in producing a region of pressure lower than that obtainable by the suction action of said engine, introducing liquid fuel and air into said region, vaporizing said fuel in the presence of said air to form a gaseous mixture, supplying heat for vaporizing said fuel from a body to be cooled, cooling air before introduction into said region by heat transfer to said mixture, adding additional air to said gaseous mixture after such heat transfer to form a suitable combustible mixture, increasing the pressure of said combustible mixture, and introducing said combustible mixture at an increased pressure into said engine.

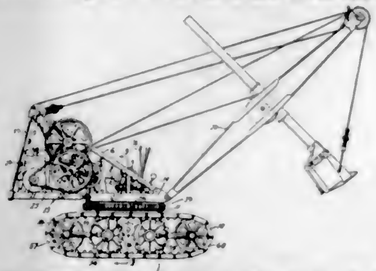


2,099,042
LIP TURNING MACHINE
John M. Whelton, Peabody, Mass., assignor to United Shoe Machinery Corporation, Paterson, N. J., a corporation of New Jersey
Application April 7, 1936, Serial No. 73,125
8 Claims. (Cl. 12—30)

1. A channel opening machine comprising a horn adapted to support internally the sole of a shoe, a plow for raising a channel lip formed on the sole, a tool for setting the lip, and means for

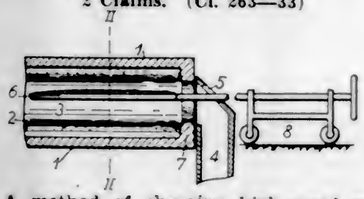
operating said plow and said lip-setting tool to feed the work.

2,099,043
CRUCIBLE
Raymond R. Wicklein, Roselle, N. J.
Application August 3, 1936, Serial No. 93,970
5 Claims. (Cl. 263—48)



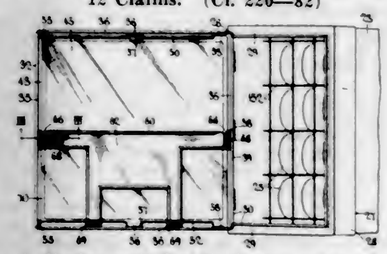
1. A crucible having the wall thereof curved from the rim portion to the bottom with the widest portion approximately midway therebetween and provided on one side wall thereof with an outwardly projecting pouring channel extending in a substantially straight line tangential to the curvature of the side wall.

2,099,044
PROPELLING AND STEERING MECHANISMS FOR TRUCKS AND THE LIKE
Emery J. Wilson, Cleveland, Ohio, assignor to Thew Shovel Company, Lorain, Ohio, a corporation of Ohio
Original application April 12, 1934, Serial No. 720,278. Divided and this application May 8, 1936, Serial No. 78,678
5 Claims. (Cl. 180—9.2)



1. In a vehicle of the class described, a power delivery shaft, a pair of propelling shafts axially aligned with the power shaft, a pair of clutches each including a slideable clutch element adapted in a first position to rotatably interlock its associated propelling shaft and power delivery shaft and in a second position to disengage said shafts, a pair of rock shafts each adapted to effect movement of a slideable clutch element, a manually operable lever having a central position and lateral positions on either side thereof, a pair of link means each connecting a rock shaft and the lever, each link means including a spring compressible by lever movement

from a central to a lateral position to effect disengagement of its associated propelling shaft from the power delivery shaft, tension means interconnecting each rock shaft and lever opposing



spring compressing force on the rock shaft to effect engagement of the disengaged propelling shaft with the power delivery shaft upon return of the lever to the central position.

2,099,045
METHOD FOR CHARGING HIGH SPEED ROTARY FURNACES
Georg Zotos, Berlin, Germany
Application April 15, 1936, Serial No. 74,514
In Germany April 23, 1935
2 Claims. (Cl. 263—33)

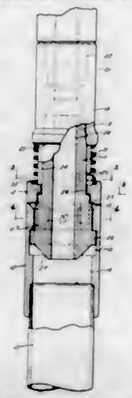
1. A method of charging high-speed rotary smelting furnaces wherein the molten material is maintained by centrifugal action as a hollow revolving cylinder, consisting in forming on a charger an elongated heap of raw material, introducing said charger into the furnace with the heap substantially parallel to the axis of the latter, and manipulating the charger so as to deposit the heap in its elongated form on the inner surface and at the descending side of said revolving cylinder.

2,099,046
DISPLAY COVER STRUCTURE
Charles W. Boston, Kenmore, N. Y.
Application January 21, 1935, Serial No. 2,809
12 Claims. (Cl. 220—82)

1. A display unit for displaying trays of merchandise comprising an upright frame section adapted to be mounted upon an open end of a merchandise container, a windowed display closure opening outwardly and forwardly from the frame section, and a frame like receptacle disposed in cooperation with the closure to form a tray receiving structure, said receptacle having opposite forwardly extending sides and also having a forwardly extending tray seating lower portion, said sides and upright side portions of the closure having releasable interlocking means normally holding the receptacle against either upward or rearward movement with respect to the upright frame sides, the tray seating lower portion being supported upon the lower portion of the closure.

2,099,047
FLEXIBLE ARTICLES
George Burt Bradshaw, Wilmington, Del., assignor to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application June 20, 1936, Serial No. 86,358
11 Claims. (Cl. 91—68)

1. A method for producing flexible articles comprising treating a metallic base material for said articles with an interpolymer of a monomeric alpha-substituted acrylic acid ester with a different monomeric polymerizable compound of the general formula

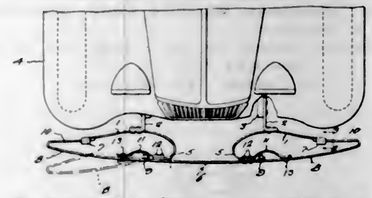


$$H_2C{=}C{-}R^1$$
$$\quad\quad|$$
$$\quad\quad R$$

where R is a member of the class consisting of hydrogen, halogen, alkyl, aryl, and aralkyl radicals, and R^1 is a member of the class consisting of aryl and a radical of the formula

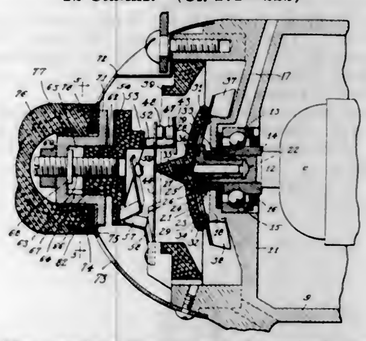
$$-C{=}CH_2,\ -C{\equiv}N,\ -O{-}\overset{O}{\overset{\|}{C}}{-}R^{II},\ -\overset{O}{\overset{\|}{C}}{-}OR^{II},\ -\overset{O}{\overset{\|}{C}}{-}R^{II}$$
$$\quad\quad|$$
$$\quad\quad H$$

where R^{II} is a member of the class consisting of alkyl, alkoxy alkyl, aryl, aralkyl and hydroaromatic radicals.



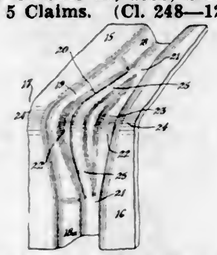
2,099,048
SETTING TOOL
Erwin Burns, Los Angeles, and Harry P. Wickersham, Huntington Park, Calif.
Application November 6, 1935, Serial No. 48,514
12 Claims. (Cl. 166—10)

1. A tool for releasably connecting a string with an object to be set in a well comprising an outer part having an opening, an inner part adapted to be received in the opening, one part being adapted to be connected with the string, the other part being adapted to be connected with the



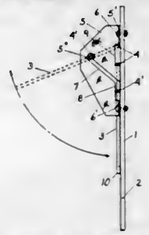
object, disengageable surfaces on the parts adapted to cooperate to transmit longitudinal forces between the parts, and a member shiftably carried by one part and releasably cooperating with the other part to transmit rotation between the parts and to releasably lock the surfaces against disengagement.

2,099,049
AUTOMOBILE BUMPER
Joseph Calabro, Everett, Mass.
Application November 28, 1936, Serial No. 113,249
2 Claims. (Cl. 293—55)



1. An automobile bumper comprising a pair of supporting members, means for attaching said supporting members to an automobile, a bar extending between said supporting members and secured thereto, substantially U-shaped guides on one end of the supporting members, end members hingedly connected, at one end, to the bar, the other ends of said end members being engageable in the guides, and springs connected to said end members for yieldingly urging the same into engagement with the guides.

2,099,050
SPEED CONTROL MECHANISM
Paul A. Chamberlain, Chicago, Ill., assignor to Chicago Flexible Shaft Company, Chicago, Ill., a corporation of Illinois
Application June 19, 1934, Serial No. 731,317
12 Claims. (Cl. 171—222)

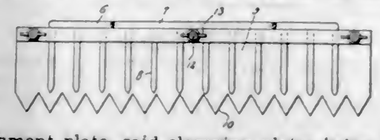


1. The combination in speed control mechanism for electric motors, of speed control mechanism comprising a centrifugal member carried on the motor shaft, a pair of contact points for closing the circuit through the motor, a ring of insulation material secured annularly on said motor, contact springs secured to said ring and lying wholly in spaced planes for carrying the contact points, one of the springs having greater tension than the other whereby to normally maintain the contact points closed upon adjustment of the first mentioned spring, means for translating lateral motion of the centrifugal member along the axis of rotation to the spring of lesser tension, and manually operable means acting on said spring of greater tension at a point remote from the axis of rotation for predetermining the position of the spring of greater tension whereby to predetermine the motor speed at which the contact points will be opened.

2,099,051
SKID PLATFORM
Carl L. Clark, Warren, and Albert G. Knowles, Niles, Ohio, assignors, by mesne assignments, to Mullins Manufacturing Corporation, Salem, Ohio, a corporation of New York
Application October 28, 1936, Serial No. 107,980
5 Claims. (Cl. 248—120)

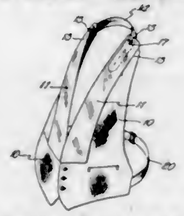
1. In a sheet metal skid platform having a deck and legs with corners therebetween formed integrally from a single metal blank, a series of relatively deep corrugations traversing the deck and legs, and relatively shallow and wide corrugations in said corners merging with and joining said deck and leg corrugations.

2,099,052
TRAP NEST
Harry J. Criner, Davenport, Iowa, assignor of one-half to A. G. Bush, Davenport, Iowa
Application April 20, 1936, Serial No. 75,367
7 Claims. (Cl. 119—49)



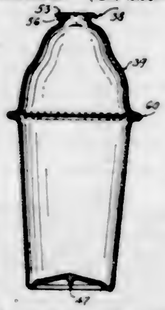
1. In a trap nest, the combination with a front plate having an entrance opening formed therein, of rearwardly extending brackets united to the plate on opposite sides of the opening, a trap door having upper and lower pivots united to the opposite ends thereof, and a vertical slot for the upper pivot and a combined vertical and oblique slot for the lower pivot formed in the brackets adapted to receive and guide the pivots and rests for the lower pivots near the upper ends of the oblique slots, adapted to support these pivots when the door is in raised or trapping position.

2,099,053
RAKE ATTACHMENT
Dan A. Donnan, Fennimore, Wis.
Application January 11, 1937, Serial No. 120,068
1 Claim. (Cl. 55—10)



A lawn rake attachment embodying an oblong resilient plate transversely curved, said plate having an edge formed to lie against the teeth of the rake and provided with bolt holes, said plate

also having a second edge provided with V-shaped teeth, a clamping plate disposed facially against the flange of the attachment plate and a second clamping plate disposed facially against the tines at the side thereof opposite to the at-



tachment plate, said clamping plates being provided with bolt holes alining with the first mentioned bolt holes, and bolts extending through the alined bolt holes equipped with nuts for positively securing the attachment in position.

2,099,054
VEST
Larry R. Engelson, New York, N. Y.
Application June 1, 1936, Serial No. 82,685
1 Claim. (Cl. 2—102)

A vest comprising two separate body sections, a lapel carried by each of said body sections, each of said lapels overlying a portion of its respective body section, a fastening element carried by each of said body sections, the fastening element carried by each of said body sections passing through an opening in the lapel carried thereby, and a removable neck strap for connecting said body sections together, said neck strap having a plurality of openings near each end thereof for engagement with the afore-mentioned fastening elements carried by the body sections with the ends of the neck strap lying between their respective body section and lapel.

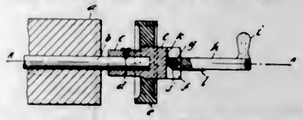
2,099,055
FLEXIBLE BOTTLE
Enoch T. Ferngren, Jackson Heights, Long Island, N. Y., assignor, by mesne assignments, to Plax Corporation, Hartford, Conn., a corporation of Delaware
Application December 3, 1930, Serial No. 499,771
Renewed March 31, 1937
18 Claims. (Cl. 229—3.5)

1. A bottle of cellulosic material comprising a lower portion with a conical smooth integral seamless outer surface to receive labels or the like and an upper smooth integral seamless portion of a generally conical shape but with a wavy outline and terminating in a mouth portion smaller than the body portion and having overturned curved portions around its mouth adapted to fit into a groove around the periphery of a stopper.

2,099,056
CONTAINER CLOSURE AND CAP
Enoch T. Ferngren, Jackson Heights, Long Island, N. Y., assignor, by mesne assignments, to Plax Corporation, Hartford, Conn., a corporation of Delaware
Application January 25, 1932, Serial No. 588,644
Renewed April 13, 1937
16 Claims. (Cl. 229—5.5)

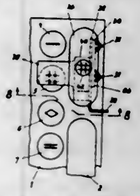
1. A container having a flexible wall at its mouth portion, in combination with a sealing element having plural flexible walls shaped to press against opposite sides of the said wall of the container at points which are spaced a distance apart on the said flexible wall, the respective wall portions being so shaped with relation to one another that the pressure condition on one side of the container wall will act to reinforce said wall against the pressure condition at the spaced point on the other side of the said wall of the container, by which a sustaining pressure in opposite direction will be had between all the contact areas of the respective wall portion.

2,099,057
TWO PART CONTAINER CONSTRUCTION
Enoch T. Ferngren, Jackson Heights, Long Island, N. Y., assignor, by mesne assignments, to Plax Corporation, Hartford, Conn., a corporation of Delaware
Original application December 3, 1930, Serial No. 499,771. Divided and this application August 20, 1932, Serial No. 629,695. Renewed April 8, 1937
16 Claims. (Cl. 229—4.5)



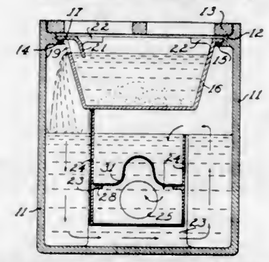
1. A bottle comprising upper and lower conical shaped portions made of thin flexible organic material, the two parts having their larger ends joined together by overlapping portions having depressions and interlocking parts composed of the thin organic material to stiffen the flexible thin portions and to facilitate handling.

2,099,058
INFLATABLE ARTICLE AND PROCESS OF PRODUCING THE SAME
Robert R. Frissell, Sandusky, Ohio, assignor to The Barr Rubber Products Company, Sandusky, Ohio, a corporation of Ohio
Application March 13, 1935, Serial No. 10,829
Renewed April 7, 1937
9 Claims. (Cl. 18—58)



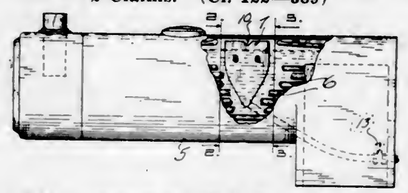
1. An inflatable article produced by dipping a form in a suitable solution, said article having an appendage with the appendage-forming portion of the form therein.

2,099,059
PLATEN-OPERATING MECHANISM
Albert Thomas Gardner, Streatham, London, England, assignor of one-half to Eric Ward Richardson, London, England
Application October 7, 1936, Serial No. 104,506
In Great Britain November 4, 1935
3 Claims. (Cl. 197—114)



1. In a machine of the character described, a platen, a shaft carrying said platen, mechanism for operating said platen, comprising a lever, one end of said lever being pivotally connected to said platen shaft, a handle at the other end of said lever, said lever being normally held in a position along the axis of the platen shaft so that it does not interfere with the normal travel of the platen across the machine, the said lever being capable of being brought into a position for rotating said platen, said lever acting about the axis of said platen shaft.

2,099,060
CALCULATING MACHINE
Johannes Gebhardt, Schonau, near Chemnitz, Germany, assignor to Wanderer-Werke vorm. Winklhofer & Jaenicke Akt.-Ges., Schonau-Chemnitz, Germany
Application July 17, 1934, Serial No. 735,681
In Germany July 22, 1933
2 Claims. (Cl. 235—62)

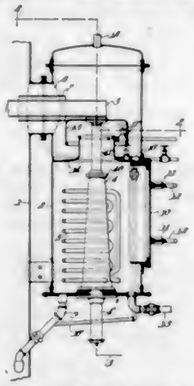


1. A motor driven calculating machine comprising calculating mechanism, a motor bar with a large handling head controlling the coupling of the motor drive with the calculating mechanism, control means normally operable by normal size handling heads serving to condition the calculating mechanism for operations other than addition, and an adjustable transmission member capable of being made operative and inoperative for selectively connecting said motor bar with at least one of the other control means, said member being slidably mounted on said motor bar, and means for indicating which of said controls is thus connected, said indicating means being shifted along with said transmission member.

2,099,061
WASTE TRAP
Arthur Gordon, Chicago, Ill.
Application July 20, 1935, Serial No. 32,351
Renewed April 3, 1937
4 Claims. (Cl. 182—9)

1. In a combination drain and waste trap having a main basin, an annular, inwardly extending flange forming a part of said basin, and a removable member having a circumferential flange adapted to co-operate with said first mentioned flange to allow a water seal to be automatically formed between said member and said basin by the water draining into the trap to prevent the escape of gases therebetween.

2,099,062
WATER CLARIFIER
Charles Graham, Stockton, Calif.
Application May 20, 1936, Serial No. 80,879
2 Claims. (Cl. 122—389)



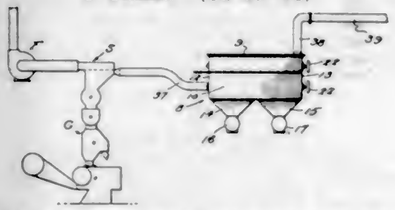
1. The combination with a locomotive type boiler, of a receptacle positioned therein, comprising a curved casing conforming vertically to the curvature of and secured against the side wall of the boiler shell and depending at its lower end between the boiler tubes and said side wall of the boiler shell to form a sump provided with a blow off tube extending through said side wall, one end of the casing having an enlarged opening the botom of which is below the normal water level of the boiler, the opposite end of the casing having a bleeder opening smaller than and above the bottom of said opening.

2,099,063
INSULATOR COMPARTMENT
Carl W. J. Hedberg, Bound Brook, N. J., assignor to Research Corporation, New York, N. Y., a corporation of New York
Application June 5, 1935, Serial No. 25,192
6 Claims. (Cl. 183—7)

1. In association with an electrical precipitator chamber, an insulator compartment including a

housing, a conductor mounted in an insulating bushing, means for shutting off gaseous communication between the insulator compartment

and the chamber, and means for opening said compartment to the atmosphere for inspection and cleaning.



2,099,064

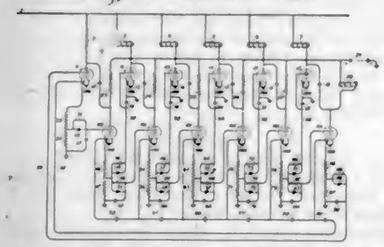
SEED COTTON CLEANER-DRIER

Nelson B. Henry, Columbus, Ga.

Application October 14, 1936, Serial No. 105,625

8 Claims. (Cl. 19—93)

7. A cotton gin outfit including a separator, a fixed conduit adapted to be connected to a source of cotton supply, means for drawing air through said conduit and separator, and means in said conduit for simultaneously heating the air and cotton drawn therethrough directly to said gin outfit.



2,099,065

DISTRIBUTOR DEVICE

William Henry Towne Holden, New York, N. Y., assignor to American Telephone and Telegraph Company, a corporation of New York

Application March 15, 1935, Serial No. 11,341

7 Claims. (Cl. 178—53.1)

1. A signal line, a plurality of signaling devices connected to said line, a first series of gas-filled discharge tubes corresponding to said signaling devices, each of the tubes of said series having their anode-cathode circuits arranged to directly serially include corresponding ones of said signaling devices, a second series of gas-filled discharge tubes corresponding to the tubes of said first series, circuit arrangements for the tubes of said second series so arranged that said tubes will operate and release sequentially with predetermined intervals, and circuit arrangements controlled by the operation and release of the tubes of said second series for conditioning the corresponding tube of said first series for operation whereby the tubes of said first series may operate in response to signals transmitted over said line.

2,099,066

HYDROGENATED RESIN ESTERS AND METHOD OF PRODUCING

Irvin W. Humphrey, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Original application January 16, 1929, Serial No. 333,033, now Patent No. 1,877,179. Divided and this application April 15, 1932, Serial No. 605,547

31 Claims. (Cl. 260—99.40)

1. The method of preparing a hydrogenated resin acid ester which includes esterifying a resin acid which has been hydrogenated in the presence of a base metal hydrogenation catalyst.

2,099,067

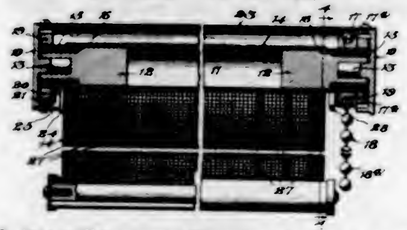
HYDROGENATED RESIN ESTERS AND THEIR PRODUCTION

Irvin W. Humphrey, Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

No Drawing. Original application December 2, 1929, Serial No. 411,201. Renewed September 22, 1932. Patent No. 2,051,796, dated August 18, 1936. Divided and this application October 3, 1932, Serial No. 636,015

28 Claims. (Cl. 260—99.40)

1. The method of preparing a hydrogenated resin acid ester of a polyhydric alcohol, which includes esterifying a hydrogenated resin acid with a polyhydric alcohol.



2,099,068

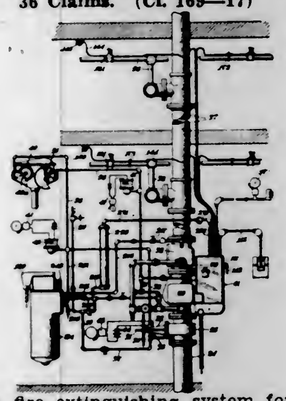
FIREPLACE SCREEN

Fred D. Keithly, Forest Hills, N. Y.

Application January 14, 1937, Serial No. 120,594

3 Claims. (Cl. 156—39)

3. In a roller screen structure, a roller, a screen wound thereon, a ring on said roller, means including a pawl pivotally mounted on said ring to limit screen unwinding rotation of said roller, and a shield over said roller having a slot one end of which is disposed to constitute a fixed stop to be engaged by said pawl to limit unwinding rotation of the roller.



2,099,069

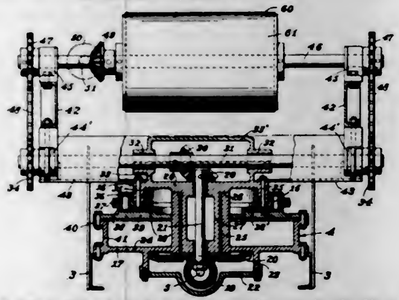
FIRE EXTINGUISHING AND ALARM APPARATUS

Ernest A. Lowe and John R. Hamilton, Cleveland Heights, Ohio, assignors to Automatic Sprinkler Company of America, Cleveland, Ohio, a corporation of Delaware

Application December 15, 1931, Serial No. 581,088

36 Claims. (Cl. 169—17)

4. In a fire extinguishing system for a plurality of fire zones, pressure producing devices in each fire zone, a main pressure responsive device and means of communication extending from each of said pressure producing devices to said pressure responsive device and each provided with a flow control unit permitting substantially unrestricted air flow toward said pressure responsive device but preventing the return passage of low pressures from said pressure responsive device to any of said pressure producing devices, said flow control unit permitting the passage of relatively higher pressures past the same in either direction.



2,099,070

TRANSMISSION MECHANISM FOR POWER BOOMS OF CONCRETE PAVERS

Axel E. Lundbye, Nunda, N. Y., assignor to The Foote Company, Inc., Nunda, N. Y., a corporation of Delaware

Application September 11, 1935, Serial No. 40,178

1 Claim. (Cl. 198—119)

A transmission for a paver boom including an upper and a lower housing, the lower housing being stationary and the upper housing rotatable therein, a cross shaft mounted in said upper housing and said cross shaft extending into bearings mounted on the boom independently of the transmission, a vertical shaft in said transmission arranged to form a central pivotal axis for the rear end of the boom, a gear and a pinion respectively mounted on the vertical shaft and cross shaft, a worm and a gear for rotating the upper part of the housing and thereby the boom, and the worm adapted to be operated by a clutch, driving means connected with the said vertical shaft for rotating the cross shaft, sprocket means on the outer end of said shaft, and bearings at the outer end of said cross shaft permitting the boom to be elevated and lowered without affecting the driving means of the transmission.

2,099,071

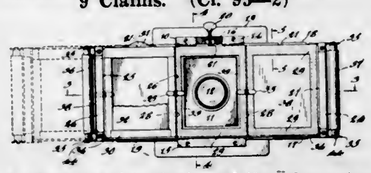
DISTRIBUTING MEANS FOR CONCRETE PAVERS

Axel E. Lundbye, Nunda, N. Y., assignor to The Foote Company, Inc., Nunda, N. Y., a corporation of Delaware

Application September 11, 1935, Serial No. 40,179

2 Claims. (Cl. 198—188)

2. A carriage positionable along a paver boom for arresting and deflecting material carried by an endless conveyor, said carriage including side frames and a front and a rear frame, the front and rear frames having a passageway therein so that the endless conveyor may pass therethrough, the side frames being provided with oppositely extending chutes, each of said side frames provided with a plurality of slots, a baffle board positionable in said slots to divert the contents of the endless conveyor to the opposite chutes, depending upon the slots selected and the angular position of the said baffle board in said slots.



2,099,072

REPEATING BACK FOR CAMERAS

Howard A. McCordock, Webster Groves, Mo.

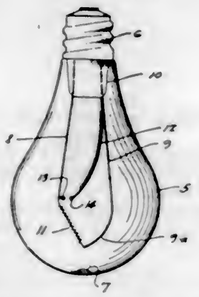
Application August 20, 1935, Serial No. 37,011

9 Claims. (Cl. 95—2)

1. A photographic device of the character described, comprising a wall having an exposure opening therein, a frame slidably mounted on said wall and having a plurality of openings adapted to register successively with the exposure-opening in said wall and adapted to receive plate-holders, and flexible light-excluding means arranged to extend over those frame-openings not in register with the exposure-opening, said means being attached at one end to the adjoining side of said wall and movably connected at its other end to the corresponding end of said slidable frame.

2,099,073

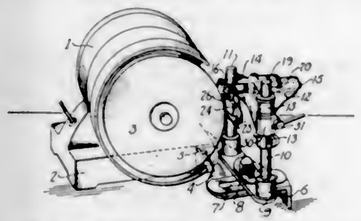
ELECTRIC ARC LAMP



Walter C. Mitchell, Los Angeles, Calif.

Application March 15, 1935, Serial No. 11,256

6 Claims. (Cl. 176—1)



1. In an electric arc lamp, a pair of terminals, a lead wire connected to each of said terminals,

a resistance coil rigidly secured at opposite ends to said wires so as to form and maintain a conductor from one of said wires to the other thereof, an electrode connected to one of said wires, a movable electrode connected to the other of said wires by a bi-metal thermostat, said thermostat normally spacing said movable electrode

from said first-mentioned electrode and adapted to further separate said electrodes when heated by the formation of an arc therebetween, and a substance adapted to be ionized by the heat of said resistance coil to form and maintain during all stages of relative movement of said electrode a conductor between said electrodes of less resistance than said resistance coil.

CHASER GRINDING MEANS
Clarence S. Mueller, Point Place, Ohio
Application November 29, 1935, Serial No. 52,025
8 Claims. (Cl. 51—92)

7. The combination with a grinding wheel of a guide frame disposed adjacent to an edge of said wheel and having laterally spaced parts, a control frame carried by one of said parts for free reciprocatory movements in a plane tangential to the adjacent wheel edge and for swinging movements in a horizontal plane toward and away from the wheel edge, said other guide frame part serving as a combined guide and stop respectively for said movements, and a chaser holder carried by the control frame for adjusting movements in a horizontal plane toward and away from the adjacent wheel edge.

TOY BUILDING CONSTRUCTION
Nils I. Paulson, Chicago, Ill., assignor to Halsam Products Company, Chicago, Ill., a corporation of Illinois
Application May 13, 1936, Serial No. 79,557
10 Claims. (Cl. 46—26)

1. As a new article of manufacture, a building block cut away at one face at the end to provide a notch of a length corresponding to the width of the block, and having longitudinal grooves in its top and bottom faces, and having a groove

transversely across the unnotched face portion at a distance from the end face of the block corresponding substantially to half of the width of the block.

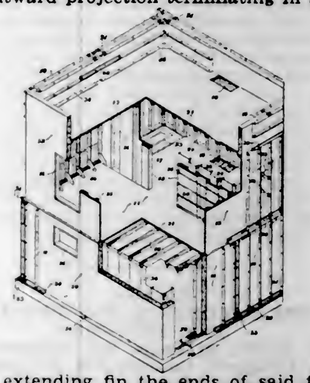
PIPE COATING APPARATUS
Albert G. Perkins, Warsaw, N. Y.
Application September 27, 1932, Serial No. 635,038
Renewed February 28, 1936
17 Claims. (Cl. 25—38)



1. An apparatus for lining pipe walls, comprising a structure adapted to travel through the pipe, means applied thereto for receiving a supply of coating material and having a feed conduit disposed substantially axially of the pipe, the discharge end of said conduit having discharge ports therein disposed substantially tangentially thereof and terminating at their inner ends in projections extending into the conduit, a revolving agitator arranged within said conduit adjacent its ports, the projecting ends of the latter cutting into and intercepting the agitated material and means for feeding the material through said conduit toward its discharge ports.

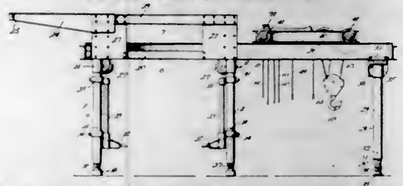
BUILDING CONSTRUCTION
Emile A. Pessagno, Chevy Chase, Md., Edwin Philip Schreier, Michael A. Patterson, and Wilfrid V. Worland, Washington, D. C.
Application April 12, 1934, Serial No. 720,324
12 Claims. (Cl. 25—131)

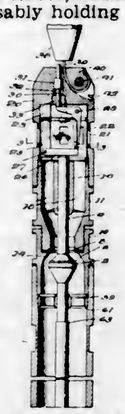


1. A sheet metal pan for casting a monolithic structure comprising a substantially rectangular inverted U shaped trough member having closed end portions, laterally extending base portions

projecting outwardly from the sides thereof, and each outward projection terminating in a down-

wardly extending fin the ends of said fins terminating short of the closed end portion.

2,099,078
STACK LIFTER
Robert T. Romine, deceased, late of Macomb County, Mich., by Mary C. Romine, administratrix, Mount Clemens, Mich.
Application January 14, 1935, Serial No. 1,810
12 Claims. (Cl. 212—74)



1. A crane or stack lifter comprising a relatively stationary frame, an extension frame relatively movable thereon in a horizontal plane, a hoist mechanism movable on the extension frame and operably connected thereto to move the same relative to said stationary frame.

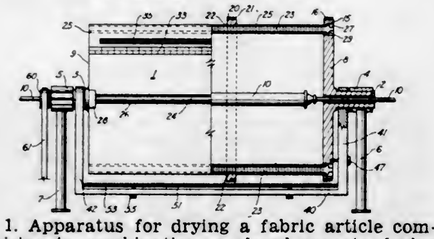
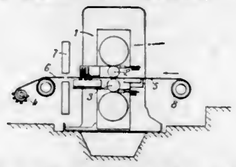
PRODUCTION OF COARSELY CRYSTALLINE AMMONIUM SULPHATE
Carl Rumscheidt and Anton Strzyzewski, Leuna, Germany, assignors to I. G. Farbenindustrie Aktiengesellschaft, Frankfort - on - the - Main, Germany
No Drawing. Application January 10, 1935, Serial No. 1,157. In Germany January 19, 1934
16 Claims. (Cl. 23—119)

1. Process for the production of coarsely crystalline ammonium sulphate consisting in the crystallization of this salt from aqueous non-acid solutions containing soluble chromium compounds.



2,099,080
BOTTOM HOLE WELL SAMPLER
George W. Rusler, Verona, Pa., assignor to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware
Application April 8, 1936, Serial No. 73,385
19 Claims. (Cl. 137—18)

1. A well sampler comprising a tubular casing, a valve in said casing adjacent each end thereof, said valves forming a sealed chamber with the casing when closed, closure means in the chamber for each of said valves, means positioned in the casing for releasably holding the valves in open



position, and means in the chamber operable by a predetermined movement of one of said valves for operating the closure means for the other of said valves.

2,099,081
STRETCHING AND DRYING APPARATUS
Edward H. Russ, Jr., Louisville, Ky.
Application April 20, 1936, Serial No. 75,504
6 Claims. (Cl. 34—17)

1. Apparatus for drying a fabric article comprising in combination, a closed arcuate drying surface, a roughened surface incorporated into the drying surface and adapted to provide a frictional contact with the article, a centrally disposed heating source within the closed drying surface and adjustable frictional contact means cooperating with the roughened surface for holding the edges of the article to be dried substantially flush against said drying surface.

PROCESS FOR THE ROLLING OF THIN SHEET METAL
Léon Saives, Billancourt, France, assignor to Louis Renault, Billancourt, France
Application June 10, 1936, Serial No. 84,565
In France October 16, 1935
1 Claim. (Cl. 80—32)

A process for rolling sheets of metal in a rolling mill and for attaching leader strips thereto

consisting in feeding the end of a leader strip through the rollers of the mill in a forward direction, welding one end of the metal sheet to be rolled to the end of the leader strip, rolling the strip and sheet through the rollers under tension in a rearward direction, welding the other end of the metal sheet to a second leader strip, further rolling the metal sheet in a rearward direction until the second weld reaches the rollers, successively rolling the metal sheet back and forth between the rollers until the desired thickness is obtained, and finally cutting the leader strips from the rolled sheet at the welds.

VALVE FOR LIQUID FLOW APPARATUS

Martin C. Schwab, Chicago, Ill.

Original application November 17, 1933, Serial No. 698,544. Divided and this application May 17, 1935, Serial No. 22,063

3 Claims. (Cl. 221—67)

1. Liquid flow apparatus comprising a container, a dispensing member, a liquid flow tube leading from within the container to the dispensing member, an air inlet tube within said liquid flow tube, ferrules having openings attached to each of said tubes, one of said ferrules movable within the other of said ferrules so that the openings may be covered or exposed by manipulation of the air inlet tube for controlling the liquid to be dispensed.
